CHAPTER I

Introductory

1. I undertook the investigation of the subject of Private Manufacture of and Trade in Arms as an academic student a number of years ago. Since that time I have been gradually accumulating such information as can be gathered from the daily press, technical and other periodicals, Government Inquiries, and Parliamentary Questions and debates.

Throughout most of the period since 1918 I have been more or less closely in touch with the actual conduct of international affairs. I was a member of the British Delegation to the Peace Conference in 1919; personal assistant to the Secretary General of the League of Nations 1920-22; private secretary to the principal British Delegate to the League of Nations 1922-24; personal assistant to the League of Nations High Commissioner for Refugees 1925-29; Parliamentary Private Secretary to the Secretary of State for Foreign Affairs 1929-31; British Delegate to the Assembly of the League of Nations 1929 and 1930; private secretary to the President of the Disarmament Conference 1932-33.

2. My experience in these public capacities reinforced the conclusions which I had previously formed as the result of the academic studies I had undertaken. It led me to believe that the system of Private Manufacture of Arms is open to the objections which have been urged against it, and that these objections are of the most serious importance in their effect upon the course of international politics.

3. I do not desire to concentrate the attention of the Commission principally upon the nature or the seriousness of what the Covenant of the League of Nations describes as the "evil effects attendant upon" the system of Private Manufacture of Arms. As I understand the terms of reference under which the Commission is working, these evils are already admitted by His Majesty's Government to exist, and it is upon the assumption that they do exist that the Commission has been asked to examine what action should be taken either by His Majesty's Government alone, or through measures internationally accepted, to eliminate these "evil effects".

The Commission has been invited in particular to examine whether these "evil effects" can be eliminated by measures of what is called "control", or whether to do so will require the total abolition of Private Manufacture and the establishment of State monopoly, either by the unilateral action of Great Britain alone, or by general international agreement.

It is with regard to these practical problems of future policy, rather than on the character and extent of the evils of the present system, that I desire principally to offer evidence to the Commission.

CHAPTER II

The General Nature of the "Evil Effects" of Private Manufacture

4. But it is perhaps desirable, in view of my personal experience, that I should also offer some evidence to support my view that the objections urged against the system of Private Manufacture are substantial, and that I should explain how, in my belief, they produce the "evil effects" of which the Covenant speaks.

5. The objections to the present system are, I believe, adequately described in the language of a Report prepared by the First Sub-Committee of the so-called "Temporary Mixed Commission" established by the League of Nations in 1921 to consider the subject of Disarmament.* The Report reads in part as follows:

"In general, the objections that are raised to untrammelled private manufacture may be grouped under the following headings:—

"1. That armament firms have been active in fomenting war-fears and in persuading their own countries to adopt warlike policies and to increase their armaments.

"2. That armament firms have attempted to bribe Government officials, both at home and abroad.

"3. That armament firms have disseminated false reports concerning the military and naval programmes of various countries, in order to stimulate armament expenditure.

"4. That armament firms have sought to influence public opinion through the control of newspapers in their own and foreign countries.

"5. That armament firms have organised international armament rings through which the armament race has been accentuated by playing off one country against another.

"6. That armament firms have organised international armament trusts which have increased the price of armaments sold to Governments."

6. There would be no difficulty in taking these objections one by one and producing proved examples in support of the various charges which they contain. It is true, as Mr. Arnold Forster pointed out to the Commission, that "the competitive arms trade is conducted in conditions which offer every inducement and opportunity for secrecy, and usually it is only some accident . . . which flashes an occasional light into the darkness." Yet although there is available only a very small proportion of the total evidence which would be revealed if the books and files of all the armament firms of the world were made public, yet on each of the six points contained in the Temporary Mixed Commission's summary of "objections," adequate and conclusive evidence is available.

7. It is usually by reference to these six charges that the subject is treated, and the Commission is no doubt familiar with the considerable body of literature in which the evidence under each of the several heads is set forth. In my submission, that evidence has established the case against the existing system.

But in some ways this usual method of treatment—by taking separately and *seriatim* the different objections to the existing system, and showing that in such and such a country cases of bribery have occurred, that elsewhere a panic has been started, that elsewhere a so-called "Patriotic Society" has been under the undue influence of the makers of armaments—is liable to obscure the true significance of the major evil which the present system involves. I would state that major evil in the following way:

The investment of large sums of private capital in armament production creates a permanent and powerful vested interest, the participants in which all depend for their prosperity on the policy which Governments pursue in respect of armaments. By the nature of the case, the controlling representatives of this vested interest wield great financial power,

* A.S.I. 1921. C. 321. 1921.

are brought by the necessities of their business into close contact with Government Departments, and generally possess or are able to establish close political connections. This vested interest constitutes a powerful force which inevitably favours the increase of armaments and opposes those policies which tend to diminish armaments and reduce the risk of war. It exercises this influence in all important countries in a more or less open and in a more or less effective way. Its methods differ according to the political habits and practice of different countries. But whatever its methods, the effect is the same: the steady pressure of an elaborately organised and financially powerful vested interest against policies which make for peace and in favour of the increase of armaments, whether there is political justification for such increase or not.

This vested interest constitutes in some ways a veritable *imperium in imperio*. Its working was thus described in an official memorandum laid before the Admiralty in 1918 by a witness to whose evidence I submit that the Commission should attach high importance, namely, Admiral Lord Wester Wemyss, at that time First Sea Lord:

"2. Apart from the moral objections to the present system, which makes warfare a direct occasion of private gain, the system is attended by the inevitable consequence that the multiplication of armaments is stimulated artificially. Every firm engaged in the production of armaments and munitions of any kind naturally wants the largest possible output. Not only therefore has it a direct interest in the inflation of the Navy and Army Estimates and in war scares, but it is equally to its interest to push its foreign business. For the more armaments are increased abroad, the more they must be increased at home. This interrelation between foreign and home trade in armaments is one of the most subtle and dangerous features of the present system of private production. The evil is intensified by the existence of international armament rings, the members of which notoriously play into each other's hands. So long as this subterranean conspiracy against peace is allowed to continue the possibility of any serious concerted reduction of armaments will be remote."

The opinion thus put forward by Admiral Lord Wester Wemyss was the result of a long and close experience of the subject with which his memorandum dealt. His biographer, in explaining the proposals put forward in the memorandum which has been cited, writes as follows:—

"It was in a far different quarter that Wemyss believed the principal authors of the war were to be found.

"For years before its outbreak he had watched the baleful activities of the armament trusts; the manner in which they had, heavily subsidising the Press, influenced public opinion in every country, stirring up strife and creating an atmosphere of hostility, ill-will and suspicion between nations.

"He had realized all the danger brought about by international armament rings who, playing into one another's hands, had a direct interest in the inflation of navy and army estimates and in war scares; for the more armaments were increased abroad the more, obviously, had they to be increased at home.

"To put an end to the era of destructive wars and help on the cause of disarmament would, he felt, be only possible by eliminating the element of private gain from the manufacture of armaments and thus make the waging of war no longer a source of private benefit."

8. It is sometimes said that whatever may have been true of certain firms in the past, the situation has been changed by the fact that the private enterprises which now engage in armament manufacture also produce other "peaceful" goods, and that in fact the proportion of their output which consists of warlike goods is relatively small. From this it is argued that such firms have only a relatively minor interest in expanding their armament business, and that it is absurd to suppose that they trouble to take political or other action for the purpose. This argument is in particular applied to large combines such as Schneider, Du Pont, Bethlehem Steel, Vickers-Armstrong, or I.C.I.

But no evidence is ever offered for the view that such big firms or combines make less effort to increase their armament business than they make to increase their other kinds of business. Nor is it explained how such firms can be content to earn no profits on the very considerable capital which they have locked up in the specialised plant required for the manufacture of many sorts of arms and ammunition. In fact no armament firm is ever content to earn no profits on its armament plant, or fails to protest when the necessity for so doing is imposed upon it.

But the fact that armaments are now produced by great combines which also manufacture many other goods has a significance of a different kind. The "armament firms" proper which belong to these combines naturally and inevitably retain the desire to expand their armament business; but the fact that through the combines their interests range far beyond their armament output, and that the combines sometimes embrace a considerable proportion of the whole industry of the country, greatly increases their power to wield an important influence in politics and on the press. It is evident, indeed, that great corporations, with their wide financial, manufacturing and commercial activities and interests, with invested capital measured in tens, or it may be even in hundreds of millions of pounds, must be able to exercise an influence far greater than that of a company restricted exclusively to armament production. The wider and the more comprehensive the capitalisation in which the original armament firms are now involved, the more comprehensive the services of banking, advertising, purchase of raw materials, manufacture of semi-finished goods (e.g. steel, etc.) which the combines perform, the more powerful in influence they become, and the stronger they grow as a potential agency for political influence and propaganda.

It stands to reason, indeed, that the financial and industrial power, and therefore the political influence, of a combine such as that of Schneider or Du Pont in the national life of their respective countries must be immense; and the power in Great Britain of groups like I.C.I. and the combine connected with Vickers-Armstrong can hardly be less.*

* For a list of the subsidiary companies under the control of Vickers-Armstrong, I.C.I., Schneider, Du Pont, see Annex A.

CHAPTER III

Government Responsibility for the System of Private Manufacture

9. I do not desire to suggest that in endeavouring to promote their armament business the individuals who control what I have called the "vested armament interest" are inspired by unpatriotic motives, or that personally they are more morally reprehensible than other classes of business men. On the contrary, I have been convinced by a study of their speeches and writings that most of them are without doubt highly patriotic men, inspired by a genuine

desire to provide employment for their workers and to serve what they conceive to be the highest interests of their country. They genuinely believe that every increase in their business, however obtained, means an increase in the military strength and therefore in the security and welfare of their respective national States.

It is obviously absurd to expect that these men should judge the ethics of armament manufacture

from the point of view of those who have had no connection with it. To the ordinary citizen, national defence is connected with the loftiest motives; with the sacrifice of his highest interests, including the sacrifice of his fortune, his happiness, and even his life, for the protection of his country. To the private manufacturer of arms these conceptions come to be inextricably mingled with those of commercial interest. Not only so; but by the nature of his business he is brought into the closest touch with many phases of the work of preparation for war, and is thus familiarised with ethical standards which are necessary in preparation for war, but which conflict with the standards of morality accepted by civilised communities in their daily life.

Thus it happens that what seem to the ordinary citizen to be grave objections to the private manufacture of arms, seem to the manufacturer himself to be an inevitable feature of his share in national defence. He is not conscious of the objections which other people feel, because he is unable to perceive that the morality of his business is on any lower plane than a good deal of the morality of war and of preparation for war, of which his business is a part.

10. To say this is simply to argue that the private manufacturer is not responsible, and ought not to be made responsible, for the results of the system of Private Manufacture. The true responsibility lies with the Governments of the world, and with the ordinary citizens who have allowed those Governments, not only to promote, but actively to encourage, the development of the system.

It is not generally realised by many of those who have raised objections to the system of Private Manufacture how direct and how considerable is the responsibility of the Governments in this regard. The following facts deserve consideration:

(a) The War Departments of the most important Governments have gone as far as any advocate of the system of Private Manufacture in actively propagating the doctrine that the possession of a strong private armaments industry is an essential element of national defence, and that therefore every possible means should be used to increase the scale and output of that industry. War Departments have not hesitated to put forward this theory in official memoranda presented to Governments or to Legislative Commissions of Inquiry. And they have gone very far in acting on the doctrine which they preach. Indeed, in actual practice not only the machinery of the War Departments, but virtually the whole machinery of the State has been used to assist private manufacturers to increase their business at home and abroad, and in this way the seal of official approval has been set not only upon the system of Private Manufacture, but by implication upon the business methods which private manufacturers have adopted.

(b) In Great Britain official Government Committees in 1887* and in 1907† reported in favour of the system of Private Manufacture, and of increasing the share of armament orders given to private firms. Ministers of State have frequently declared, as the Right Hon. Reginald McKenna declared in 1909, that great armament firms are "a national asset" and that if they did not exist the "first duty of the nation would be to discover them."

(c) By a systematic and carefully planned distribution of orders, British War Departments have sought to increase the number of factories and establishments engaged in armament production.

(d) They have paid and are still paying direct subsidies to private firms for the maintenance of specialised armament plant. They have placed the results of armament research conducted with Government money at the disposal of private firms.

(e) Some Governments have on occasion approved or actually backed loans by their own nationals to foreign Governments in payment for arms purchased from their private manufacturers. There is one known example of the despatch of a warship, at the request of a private firm, on a special voyage to give a demonstration of artillery to the agents of a Government which was the potential client of that firm.

(f) Diplomatic support is given by the Embassies and Legations of virtually all arms-producing Powers to the agents of their private firms when they are seeking orders; on occasion this support is extremely active.

(g) Military and naval missions have on occasion acted almost as the agents of their country's private armament firms, and it has been an almost general practice that they should co-operate very closely with such firms.

I have emphasised these facts—all of which can be substantiated by numerous historical examples—in the hope that the Commission will understand that in what follows I have no desire to attach personal blame to any individuals for the evils to which the system of Private Manufacture gives rise. Everyone who reflects upon the matter must regret profoundly that it should be possible in the twentieth century for such evils to occur; but he will also recognise that they are not due to unscrupulous behaviour on the part of individuals, but are the natural result of a system for which Governments are responsible. He will further recognise that Governments are still actively promoting the development of this system, although it is founded on principles which are at variance with enlightened modern conceptions of morality and civilisation.

* Committee presided over by Mr. John Morley, M.P. (C. 5116, 1887).

† Committee presided over by Sir G. H. Murray (Cd. 3626, 1907).

CHAPTER IV

Recent Examples of the Influence of the Vested Armament Interest

11. But in spite of these important considerations, it none the less remains true, as was said above, that the existence of a powerful vested armament interest within the State is liable to exercise a dangerous influence on the political life of individual nations and of the world as a whole, by stimulating an artificial pressure for increases in armaments, and by opposing an obstructive propaganda to the adoption of policies of organised peace and disarmament, from which alone international stability and prosperity can result.

It would be easy to cite many proved historical examples of the way in which this dangerous influence has operated. In this regard, as Admiral Lord Wester Wemyss' evidence shows, the period before the outbreak of war in 1914 deserves particular attention. There is, indeed, only too much ground for his view that the vested armament interests played a part of first-rate importance in

preparing and shaping the events from which war resulted. In his book "Twenty-five Years" the late Lord Grey declared that in his mature judgment the most important cause of that war was armament competition—the competition in land armaments between the Triple Alliance and the Triple Entente, and the competition in naval armaments between Germany and Great Britain.* The forces of fear, distrust and passion which created and quickened the development of that armament competition were without question greatly strengthened by the activities of the vested private interest in armaments. We cannot doubt that in making such a condemnation of their activities as that which has been cited above, Admiral Lord Wester Wemyss was moved by his memories of the activities of Krupp,

* Lord Grey of Fallodon, "Twenty-five Years", vol. I, pp. 91-2.

which had been exposed in the German Reichstag by Herr Liebknecht in 1913; and of Mr. Mulliner, of the Coventry Ordnance Factory, which came to light when Mr. Mulliner's diaries were published in the *Times* in 1910. To those who have examined the history of the period with this in mind, it is difficult to doubt that the activities of such agents of the armament industry did much to create the forces by which the pre-war movements for organised peace and disarmament were brought to nothing—for example, the Hague Conferences, the Anglo-German naval discussions, and Mr. Winston Churchill's proposal for a "Naval Holiday."

12. Of these and other instances drawn from pre-war history, adequate accounts have been published in books with which the members of the Commission are no doubt familiar. It will, therefore, suffice to illustrate the argument which I venture to submit to the Commission if I cite two recent examples of what I mean.

13. The first is drawn from my personal experience at the Disarmament Conference in Geneva in 1932-33.

For the success of that Conference the co-operation of the Governments of certain continental countries was essential. It was known that the Governments of those countries genuinely desired to reach an agreement and to make a first Disarmament Treaty, provided they could obtain adequate support from their public opinion at home. In this policy they were, of course, opposed by some sections of their General Staffs, by some elements in the Government Departments, and by some sections of opinion. The strength of this opposition was enormously increased by the consistent hostility of the vast majority of their national press. From the opening of the proceedings in Geneva most of their newspapers consistently and grossly misrepresented what took place in the Conference. They suppressed news; in their comments they tried to create a general belief that early and complete failure was both expected and desired by all important delegations; and in their editorial articles they bitterly attacked both the Conference itself and the policy of disarmament which it was seeking to carry through.

This sabotage by the press was, in my belief, a very important factor in delaying the work of the Conference, in exhausting the first wave of determination to get results with which the Conference began, and in making it difficult for the Governments in question courageously to take the major decisions which were required for the adoption of any scheme of disarmament.

I have no absolute proof which I could submit in a court of law that this attitude of the newspapers in question was due to bribery or financial control by the vested armament interest; but I share the conviction of most impartial and well-informed observers with whom I discussed the matter at the time that this was the case.

14. The second example which I wish to cite relates to the question of air disarmament, and the part played in relation thereto by the private armament interests in Great Britain. For a variety of reasons it constitutes an extremely valuable illustration of the argument I wish to lay before the Commission. Thus:

(a) An agreement on Air Disarmament was of vital importance to the success of the Disarmament Conference, and therefore to the future strength and success of the League of Nations. As the present Prime Minister said while the discussions in the Conference were going on: "All disarmament hangs on the Air."

(b) In the facts to which I wish to draw the attention of the Commission there is no question of personal corruption or dishonesty, or of the ordinary evils generally connected with Private Manufacture.

(c) It is impossible to doubt the patriotism and public spirit of the individuals who were responsible for the action which I will describe.

(d) Their responsibility was lessened by the fact that they had the support and approval of the controlling elements of the Government Department—the Air Ministry—with which they were primarily concerned.

(e) Yet, as I shall endeavour to show, the fact remains that the vested air armament interest in Great Britain, by means of a long-period campaign of propaganda, had succeeded in leading what I may perhaps call the organised air interests of the country—i.e., the pilots, other ranks of military and commercial air services, officials, writers on aviation in the Press, etc.—to believe that the policy of Air Disarmament was foolish, impracticable and detrimental to British interests, and that all measures by which it could be brought about were unworthy of consideration by serious-minded and patriotic citizens of Great Britain.

(f) This campaign, resulting in the virtually unanimous opposition of the air interests to disarmament, was a principal factor in defeating the success of proposals for Air Disarmament in the Geneva Conference.

(g) The defeat of these proposals not only helped to cause the failure of the Disarmament Conference and thus to produce the present dangerous situation in Europe and throughout the world, but it also rendered a signal disservice to the vital interests of Great Britain, and in particular to the vital interests of British aviation.

15. In support of this contention I venture to put forward in a summarised, and therefore in what may seem a somewhat didactic form, certain conclusions based upon the prolonged debates among the air experts of many countries to which it was my duty to listen in the Disarmament Conference.

(a) Civil aviation is still in its infancy. Up to the present time it has been exploited for the most part on a national basis by national organisations working under national laws and restrictions of many kinds. In consequence those responsible for its development have tended to concentrate their attention principally upon short distance journeys. The advantage of aviation for short distance journeys is not very great; for long distance inter-continental journeys, on the other hand, its advantage is overwhelming, and it is certain that, as the technique of aircraft construction and knowledge of meteorological conditions and air navigation are improved, the future of aviation for the transport of passengers, mails and freight for long distances ought to promise almost unlimited expansion. Inter-continental air services, rendering to the world in at least a considerable measure the services which railway systems now render, for example, to the continent of Europe, would require a vast increase in the number of aircraft produced, in the number of pilots and other technicians employed, in the scale of the aircraft industry, and in the personnel of ground staffs and maintenance services.

(b) To regard the immediate military development of aviation as more important than this long-period prospect of civil expansion is extremely short-sighted. It is true that at the present time the output of military aircraft is at least ten times that of civil aircraft. But although aircraft are a relatively cheap form of armament, and although it is probable that at the present rate of development the major Air Forces of the world may in a short period of years reach the scale of ten thousand first line machines, there is nevertheless a limit to the taxable capacity of the peoples, upon which in the long run military expansion must depend. There is the further and much more important consideration that expansion on the scale already going on will rapidly create such an atmosphere of international distrust and strain that, as in 1914, the anxieties of the General Staffs will almost of themselves plunge Europe into war. With Air Forces of the magnitude now being planned, the destruction of that war will be such that, as the present Prime Minister has so

often said, western civilisation itself would probably not survive the struggle. It may be particularly noted that one of the first objectives of air bombardment in that war would be the factories of the aircraft industry, and that owing to the nature of their product these factories take up so much room that they are exceedingly vulnerable to air attack and virtually incapable of effective protection. It is therefore exceedingly probable that the result of an outbreak of air war to the private manufacturers of aircraft would be a total loss of their capital investments.

(c) Air warfare is, by common admission, a greater danger to the United Kingdom than to any other country in the world.

(i) The danger of large-scale air attack destroys our island immunity from invasion.

(ii) The vulnerability of merchantmen at sea to air attack makes our dependence on overseas supplies a deadly menace.

(iii) Aerial torpedoes launched from aircraft operating behind smoke screens laid by aircraft constitute an as yet untested, but, none the less, a disturbing menace to the sea-power of the British navy.

(iv) The danger to London and its docks of air bombardment is a greater threat to the heart of the British Empire than any blow which British Air Forces could possibly strike against any foreign Power.

In other words, total Air Disarmament and the effective abolition of air warfare would be of supreme strategic advantage to Great Britain and the British Empire, and would so increase our national security that it would be worth almost any price we were called upon to pay.

(d) But in fact the price which it would be necessary to pay to secure this strategic advantage is one which would not damage British air interests in any way, but on the contrary would probably promote them. For the proceedings of the Disarmament Conference showed conclusively that the only method of securing Air Disarmament and the abolition of air warfare lies in the effective demilitarisation of all civil aviation, and in the acceptance of some regime of international control over commercial aviation. But the demilitarisation of civil aviation, and the removal of the present national restrictions upon international flying, is the only means by which a big expansion of civil aviation can be hoped for. That is to say, the very measures which are required to give Great Britain immunity from the greatest single threat to the safety of the Empire are the measures which in themselves would open the way to the expansion of aviation as a world-wide service, linking the continents as railways link the provinces of national States to-day.

(e) And British aviation has more to gain from this demilitarisation and denationalisation of flying than any other nation in the world. For:

(i) As all experts are agreed, the geography of the British Isles militates against the large development of commercial aviation at home. Almost all other large countries have great advantages as against Great Britain in this regard.

(ii) Air communications between Great Britain and the overseas dominions have to follow routes which make the present national restrictions upon international flying a severe handicap. The difficulties of establishing effective services to Africa and India furnish striking examples.

(iii) In consequence, our present share of the commercial aviation of the world is far below the proportion which ought to result from the pre-eminent excellence of our national aeronautical research, of our aeronautical engineering, of our ground organisation, and of the flying-skill of our pilots. Any reasonable regime of international organisation and control would remove this unfair handicap.

16. During the Disarmament Conference at Geneva in 1932 and 1933, total Air Disarmament and the abolition of air warfare was proposed by the delegates of a large number of nations. It entered the realm of practical politics after the speech made in the House of Commons by the present Prime Minister of Great Britain on 10th November, 1932. In pursuance of the policy of total air disarmament urged in that speech, the British Secretary of State for Air, Lord Londonderry, went to Geneva and secured the establishment of a special Air Committee of the Conference. The terms of reference of this Committee were as follows:

"To examine the possibility of the entire abolition of military and naval machines and of bombing from the air, combined with an effective international control of civil aviation."

In the course of the debates in this Committee the policy of total air disarmament was warmly supported by France, Germany, Russia, Italy (subject to certain reserves which no doubt would have been waived if general agreement had been come to), Spain, Sweden, Belgium, Holland and other Powers. It was ultimately accepted also by the United States Government shortly after President Roosevelt came into office in March, 1933. The discussions of the General Commission of the Disarmament Conference showed that support among the smaller European Powers, among the South American republics, and other Members of the League was virtually unanimous.

But it was always evident from the first day of the discussion that agreement for total Air Disarmament could not be reached unless far-reaching measures were also accepted to fulfil a condition laid down by Lord Londonderry in the following terms: "*Provided that there can be devised an effective scheme for the international control of civil aviation which will prevent all possibility of the misuse of civil aircraft for military purposes.*"

In the course of the debates the following measures were put forward and were very widely supported as essential for the fulfilment of Lord Londonderry's condition:

(a) The total abolition by international convention of aerial bombing in all its forms.

(b) What was loosely called the "internationalisation" of commercial aviation, i.e., some regime of international organisation and control for commercial air lines, in particular the international lines on which heavy aircraft are in use.

(c) A system of international supervision and control for other kinds of civil aviation.

(d) The establishment of some system of joint collective air action to prevent the misuse of civil aircraft for purposes of aggressive war. For this purpose the French Delegation proposed the establishment of a European International Air Police Force, and secured wide support for their proposal. Other delegates suggested that the case might be met by the joint training and co-operation of small national contingents of military aircraft, maintained exclusively for the purpose of supporting the League of Nations in case of aggression.

Broadly speaking, these measures secured the general acceptance of a large number of Powers, and particularly of European Powers, represented in the Disarmament Conference. The opposition to their adoption made by the German Delegation was formally withdrawn on 27th May, 1933.

The opposition to all these measures was led by the British Air Delegates. Having listened to the discussions which took place, I venture to express the view that it was the obstruction of the British technical experts to the adoption of any practical plan for the four purposes mentioned above which was principally responsible for the failure of the Disarmament Conference to secure total Air Disarmament. I have heard the opinion expressed by many impartial observers that if the British air experts had been fighting for a disarmament solution as hard as they were fighting against it, the success of the Conference in this matter would have been certain.

How near the Conference was to reaching success, and how strenuous was the opposition of the British technical experts, has been explained by no less an authority than the then Secretary of State for Air himself, Lord Londonderry:

"In 1932 the Disarmament Conference assembled, and almost its earliest discussions were centred around the possibility of the total abolition of air forces or at least of the abolition of the artillery of the air, the bombing aeroplane, which is the weapon which is the distinctive arm of the Air Force and to which it owes its separate existence.

"Through that period, difficult for any Air Minister and particularly for one who, like myself, has always been convinced of the prime importance of the maintenance of an effective air arm to the security of this country, I kept impressing upon my colleagues and upon the country generally the vital nature and place of the Royal Air Force in the scheme of our defences. *I had the utmost difficulty at that time, amid the public outcry, in preserving the use of the bombing aeroplane, even on the frontiers of the Middle East and India, where it is only owing to the presence of the Air Force that we have controlled these territories without the old and heavy cost in blood and treasure. I felt certain that when the ideals of abolition were examined practically they would be discovered to be inapplicable in the state of the world to-day. We could not put the clock back.*" (Hansard, House of Lords, 22nd May, 1935, Col. 1017.)

17. It is, of course, true that Lord Londonderry, in making this speech and in allowing his air experts in Geneva to obstruct all practical proposals for dealing with the danger that civil aviation might be used for aggressive purposes, was acting as Secretary of State, and therefore with what may at least be called the permissive authority of the Government. In so doing he was certainly not fulfilling the desires of the British people, as subsequent evidence has clearly shown. But he was—and this is the point to which the attention of the Commission is respectfully directed—representing the overwhelming majority of what I have called the "organised air interests" of the country.

Among these interests there were notable exceptions of distinguished aviators who had held positions of high responsibility, and who publicly expressed themselves in favour of the policies necessary to secure Air Disarmament. But, broadly speaking, Lord Londonderry had the full support of all the air interests in the United Kingdom—whether in Government service, in commercial work, in the private aircraft firms, or among the experts who write about aviation in the press. Unless this had been true—if, that is to say, there had been a strong body of technical air opinion supporting and explaining to the country the plans for securing Air Disarmament put forward at Geneva—it would, in the state of opinion then existing, have been impossible for Lord Londonderry to authorise his experts to act as they did. In other words, it is virtually certain that, so far as this country at least is concerned, Mr. Baldwin's policy, had it received the vigorous support of even a considerable section of the "organised air interests", would have triumphed in this country, and, as has been argued, in Geneva also.

17a. The opinion of the "organised air interests", and the short-range view they took of the importance of aviation in the development of civilisation, was, in a considerable measure at least, formed by the work of two kinds of agency:—

(a) Some of the more widely read of the periodical journals which are devoted to aviation.

(b) The so-called "Patriotic" Societies which have devoted themselves to preaching the necessity of "Air Power" to British opinion, and to promoting the interests of aviators and the aircraft industry in various ways.

18. The periodical journals have an immediate short-period vested interest in the expansion of military aviation—at least so long as Government purchases of military machines constitute the principal market for the aircraft industry. One of them has declared in an editorial article that it could not live without the aircraft industry, which in its turn lives by its sales of war machines. A perusal of the pages of these journals shows that without the advertisements of military machines which they receive from private manufacturers, they might find it difficult to carry on.

The periodical journals in question have, for a long time, consistently attacked the policy of Disarmament in all its forms. They have attacked all the proposals for the international control of civil aviation, by which the abolition of air warfare might be obtained; they have vigorously resisted the abolition of aerial bombardment; some of them have attacked the League of Nations and all policies of international co-operation; one at least has consistently preached the certainty of another world war in a comparatively early future; some of them have strongly supported the system of Private Manufacture and have attacked the proposals for its abolition. They have thus helped to create a general belief in the minds of their readers that all policies of international organisation and co-operation are utopian, unpatriotic and dangerous.

19. There have been at different times several "Patriotic" Societies which have concerned themselves with teaching British opinion the value of "Air Power," and with emphasising the weakness of our present Air Forces in comparison with those of other States. During the Disarmament Conference their activity was particularly intense; they organised a campaign against the abolition of aerial bombing; they attacked disarmament in all its forms; and for many years before the menace of German air re-armament had begun they urged great increases in the size of the British Air Force. They have always shown particular anxiety concerning the interests of the private manufacturers of military aircraft, and they have sometimes intervened officially with Government Departments on their behalf. There is considerable evidence for the view that the financial and other connections of these "Patriotic" Societies with the private manufacturers of military aircraft have been close enough to prove decisive in determining the policy which the societies pursued.

20. It is respectfully submitted for the consideration of the Commission that the persistent propaganda of these journals and organisations, conducted over a long period of years, played a great part in converting the "organised air interests" of Great Britain to the view that the real importance and real future of aviation lay in preparation for war, rather than in preparation for peaceful international co-operation; and that the expansion of British military air forces was the supreme purpose which all "air-minded" patriots should at all costs strive to attain. It is further submitted that in so doing these journals and organisations played a considerable part in defeating the policy which Mr. Baldwin laid before the world in his speech of 10th November, 1932, and which, as Lord Londonderry has said, came so near to success at the Disarmament Conference six months later.

The above facts have been set out at such great length for the reason that they appear to me to offer a unique, but little noticed, example of what I have called the "major evil" of the existing system of Private Manufacture, namely, that it creates a permanent vested interest which leads men of high probity and public spirit to exert a continuous and sometimes exceedingly influential pressure against the policies of organised peace and disarmament, and in favour of armament increases of different kinds.

CHAPTER V

The Basic Principles of Armament Policy: International Anarchy and Organised Disarmament and Peace

21. I have argued above that the system of Private Manufacture of Armaments is one for which Governments, and therefore the peoples of the civilised countries as a whole, are responsible, and that it is foolish and unjust to saddle the private manufacturers with special blame for what they do to increase the sales of their goods under competitive conditions similar in many regards to those of other industries.

I desire now to call the attention of the Commission to some of the basic principles which His Majesty's Government ought to bear in mind in formulating their policy concerning Private Manufacture.

22. The purpose of national armaments in the modern world, as determined by international treaties, is to preserve peace and to secure the safety of national territories from invasion.

23. In seeking to fulfil this purpose, Great Britain has associated itself with 56 other nations in establishing the collective system of the League of Nations Covenant and the Pact of Paris for the Renunciation of War. Under this system:

(a) Conquest is abolished by the guarantees of Article 10 of the Covenant.

(b) War is forbidden "as an instrument of national policy". (Articles 12-15 of the Covenant; Pact of Paris.)

(c) Machinery, procedure and law are provided for the pacific settlement of international disputes. (Articles 12-15 of the Covenant; Kellogg Pact; Permanent Court of International Justice; Optional Clause; General Act.)

(d) Disarmament by international agreement to the lowest point consistent with national safety and international obligations is enjoined. (Article 8 of the Covenant.)

(e) Full publicity with regard to armaments is enjoined. (Para. 2 of Article 8 of the Covenant.) (It has been shown that in practice this must involve international inspection, if the obligation is to be effectively observed.)

(f) Collective action by all Members of the League is enjoined against any State which disturbs international order by resort to aggressive war. (Articles 16 and 17 of the Covenant; Locarno Pact.)

24. Unfortunately the provisions of Article 8 of the Covenant have not yet been fulfilled, and so far as armaments and armament policy are concerned, Governments are not yet basing their policy upon the principles of the collective system by which in law they are bound.

On the contrary, with regard to armaments they are still pursuing the policies of what has been called the "international anarchy" of the pre-war period. This anarchy leads almost automatically to armament competition and to the formation of armed alliances. As the armament competition between rival groups becomes more acute and more dangerous, it means that in practice Governments must subordinate almost every other consideration of national policy to prospective military advantage; it means that diplomacy must, in considerable measure, be founded not only upon the principle "my country, right or wrong", but upon the still more pernicious principle of "my alliance, right or wrong". This principle is not only inconsistent with, but is utterly destructive of any organised system of international law and order.

As I have said, the great majority of nations are legally bound by the obligations of the two treaties analysed above; and the Governments have by no means abandoned their attempt to make the collective system a reality. On the contrary, responsible members of the most important Governments have recently declared that it is more essential than ever that the nations should uphold the Covenant in order that by so doing they may be able to arrive at effective disarmament agreements. But since such agreements have not yet been made, every Government feels itself obliged to apply in armament policy the principles of the system of international anarchy. In some ways (e.g., in respect of scientific research for the "improvement" of armaments) the armament competition and the dangers which it involves are far greater than in the pre-war period. There are many signs of a return to the old policy of alliance and counter-alliance, and espionage has never been more active than at present.

25. It is plain that the merits of the problem of the Private Manufacture of armaments may differ considerably under these two systems.

Private Manufacture is certainly open to objection on moral grounds; but it is difficult to maintain that it is ethically more reprehensible than the rest of the system of international anarchy, i.e., armament competition, and the espionage and power-diplomacy to which armament competition obliges Governments to resort. So long as foreign policy is founded upon the expectation of war and the pursuit of military advantage in war, then the moral aspects of Private Manufacture will remain of secondary importance. Similarly, from the technical point of view, the removal of the "evils" of Private Manufacture would be far simpler under a disarmament system, while from the political and strategical points of view some people would certainly argue that, while Private Manufacture may be an unhappy necessity under conditions of international anarchy, it would be dangerous and undesirable to retain it under a system of international disarmament.

In other words, the conditions of the two rival systems of international anarchy and organised collective peace and disarmament differ so fundamentally that it may clearly be possible that measures for dealing with Private Manufacture which ought to be adopted under the one system may be undesirable or impossible under the other.

26. In the evidence which follows I propose to argue that even if His Majesty's Government are unable in the near future to secure an international treaty for the Reduction and Limitation of Armaments, including a stringent system of supervision and control, it will nevertheless be to the advantage of the nation that they should abolish Private Manufacture of armaments on British territory. I venture respectfully to suggest, however, that even if the Commission should not find it possible to accept this conclusion, they should nevertheless consider, as a separate problem, whether, when disarmament is finally brought about, Private Manufacture should not then be abolished.

In other words, I submit that the Commission should consider the problem of armament manufacture on two hypotheses:

(a) That of a collective system of the kind which His Majesty's Government is endeavouring to create, including a Disarmament Treaty, full publicity for armaments, and international supervision and control; and

(b) The conditions of international anarchy upon which armament policy at the present time is in fact determined;

and that they should make recommendations for action by the Government appropriate to the differing conditions which these two hypotheses involve.

CHAPTER VI

How to deal with the "Evil Effects" of Private Manufacture:
Abolition or Control?

27. If it be admitted that the authors of the Covenant were right in declaring that the system of Private Manufacture is "open to grave objections," and that measures should be adopted to eradicate the "evil effects" to which it leads; or even if only a *prima facie* case for this view can be made, every right-minded person, including certainly those engaged in the manufacture of armaments themselves, must ardently desire that adequate measures should be taken to suppress these evil effects. As the terms of reference of the Commission show, His Majesty's Government evidently desire that the Commission should make all useful proposals to this end.

Broadly speaking, the proposals so far put forward fall under two broad headings: those for what is loosely called *control*, and those for the *abolition*, of Private Manufacture.

28. The word "control" is loosely used to describe widely differing kinds of systems.

(a) Some people who use it mean nothing more than the acceptance by all nations of the system now in force in Great Britain, namely, that arms and ammunition must not be exported without the previous granting of a Government licence. There are those who claim that if this system were internationally adopted, the evils of Private Manufacture would be effectively prevented.

(b) Others have used the word "control" to mean something more ambitious. They have usually taken the Convention of 1931 on the Manufacture of and Traffic in Dangerous Drugs as the model for the system they propose. Under that Convention, they point out, each signatory State is allowed a limited annual supply of various drugs for its "legitimate scientific and medical requirements." Thus the total legitimate world demand is officially determined. This demand is met by the various private drug factories in the nine or ten countries which rank as "Producing States." These factories both supply their home markets and export the drugs required by non-producing States. No factory may manufacture drugs at all without a licence from its Government; nor may it export drugs without a further licence, specifying the permitted quantity and the destination to which the drugs are sent. Copies of all these licences must be furnished to the Secretariat of the League of Nations, for examination by the League Central Board. All factories are subject to close national inspection, and their total product is carefully controlled. Combined with the international control of the League Central Board, this system of licences and inspection ensures, it is maintained, that drug production does not exceed the total of legitimate world requirements, thus the illicit trade in drugs is dried up at its source.

A similar system, it is argued, could be established for the Manufacture of and Traffic in Arms. The Disarmament Convention would establish the world's total "legitimate requirements." A system of licences and inspection, under the control of the Permanent Disarmament Commission, would ensure that this total is not exceeded. Since the Disarmament Treaty itself would forbid armament expansion beyond permitted limits, the evils of private firms' solicitation for orders would be removed. And as for illicit traffic, it is maintained that while smuggling of drugs may be easy, the smuggling of Arms and Munitions is very hard.

(c) Others who advocate control have gone even further in what they demand. The United States Government, for example, have put forward in Geneva a Draft Convention, the merits of which have been explained to the Commission by Miss Kathleen Courtney. If this Draft Convention had been adopted, it would have involved not only

national Government licences for the manufacture, export and import of arms, together with the publication of all armament orders before their execution; it would also have meant a system of international inspection and control of all armament factories.

(d) Yet others have proposed the establishment of a National Arms Board, with a monopoly of the distributive trade in arms, both for home Government consumption and for export. Although this proposal is sometimes put forward as an alternative to the abolition of Private Manufacture of Arms, it yet goes so far beyond what is ordinarily meant by control, that it hardly falls within the discussion of this present chapter.

29. It is plain that systems of control such as that contained in the Convention on the Manufacture of and Traffic in Drugs, or in the Draft Convention put forward by the Government of the United States, would considerably reduce the present unhampered freedom of the armaments trade. Moreover, if a system of licensing and control were founded upon and linked to the principles of the Covenant and the Pact of Paris, it might serve a most important purpose. For it would then become a rule of national policy that no licence should be granted for the export of arms to States engaged in aggressive war in violation of the Covenant and the Pact, or to States whose disputes were subject to the consideration and adjudication of international tribunals. Indeed, such a rule would seem to be the logical result of the acceptance by a Member of the League of any system of Government licence for armament exports, since, as the United States Government has pointed out, licensing of exports establishes the principle of full Government responsibility for the despatch of arms even from private sources, and thus implies Government approval of the purpose for which the exported arms are to be used.

I will later suggest that the Commission would do well to recommend to His Majesty's Government the adoption of a stringent system of control on the lines proposed in the United States Government's Draft Convention; and that this system should be operated on the basis of the principle just suggested, namely, that the export of arms should never be allowed to States who may be engaged in preparing aggression, or who have actually violated their international engagements by resort to aggressive war.

30. But it is difficult to see how any system of control of the kind now under discussion (not, of course, including the proposal for a National Arms Board) can remove the evils of Private Manufacture referred to above. How can the British Government, for example, before it issues an export licence, ascertain that the order for the arms to be exported has not been obtained by bribery and corruption of the officials of some foreign State? How can they be certain that the agents of co-operating armament firms have not agreed to "play one country off against another"? How can they, by a licensing system, ensure that those who control private armament firms shall not also control newspapers in their own and foreign countries? How can they ascertain that agents of armament firms have not "disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armament expenditure"? How can they ensure that the firm seeking the export licence does not form part of an international trust or combination?

It is difficult to resist the conclusion that those who urge that "control" is adequate, or who simply advocate the general adoption of an export licence system such as that which Great Britain to-day enforces, are not really convinced that there are any considerable evils in the present system which need to be removed.

31. It is, indeed, evident, whatever the advocates of control may say, that no system of licensing and supervision can in itself remove the real cause of the major evil of the present system, namely, the fact that a large number of influential people with important industrial, social and political connections and with large financial resources at their disposal are, by the nature of their business, driven to work for the increase of existing armaments. Under any system of control, however stringent, the profit motive will continue to operate.

32. In the first place, it is plain that unless the system of control is combined with an international agreement on disarmament, i.e., for the qualitative and quantitative reduction and limitation of the stocks of arms which nations are permitted to possess, the profit motive will have a free field for its operation exactly as it has to-day. Those who make and sell armaments will continue to seek new contracts, and the system of "control" will place no restrictions upon Governments in giving orders whenever the agents of private firms can persuade them that their countries require greater quantities or new or better qualities of arms and ammunition.

33. But it may appear at first sight that if the system of "control" were combined with an international treaty for the reduction and limitation of armaments, then it would suffice to remove the unfortunate effects of the profit motive. And no doubt, if it were honestly applied, such a combined system of disarmament and control would severely hamper the operation of the profit motive, since it could not fail to check the increase of armaments which private manufacturers desire. It would moreover greatly assist the Governments in checking what have been called the "minor evils" of the private trade in arms, i.e., the illicit traffic with backward and uncivilised parts of the world. In this way, if generally adopted and combined with an adequate system of publicity and control, it might prove of real assistance to the British army in preventing costly outbreaks of disorder on the remote frontiers of the Empire. The system could be made more effective if evasion of the prohibition to export without licence were punished by the subsequent withdrawal of all British Government orders from the offending firm.

34. But even under a Disarmament Treaty, the profit motive would in some degree continue to operate, and what may be called the inherent disadvantages of Private Manufacture would appear. Thus:

(a) The private armament firm would have, under a system of armament limitation and international control, an *enhanced* incentive to recoup the diminution of profits which reduction of armaments must cause by indulging in illicit production and trade. How true this is has been proved by the Central Drugs Board, which has discovered illicit traffic on the largest scale.

It is true that arms and munitions are harder to smuggle than drugs; but there has been enough "gun-running" in modern times in Ireland, China, the Riff, the Persian Gulf and elsewhere to prove that Governments cannot always prevent it, however hard they try.

(b) Private firms would likewise have an enhanced incentive to establish new arms factories in countries where the administration is incompetent or corrupt, and where, in consequence, the system of control would be less effective. Drug manufacturers have proved how real is this danger, by establishing factories in such countries. The danger would be increased in respect of arms by the absence of publicity in countries which are not governed by the methods of Parliamentary democracy.

The uncontrolled production of arms in such countries might constitute a serious menace to international peace, particularly on the remote frontiers of the British Empire.

(c) The danger of such abuse would be greatly increased if the Disarmament Convention failed to impose the strictest quantitative limitation upon arms of every kind. Indeed, even if a strict quantitative limitation is imposed, the control of that quantitative limitation of small arms, aircraft, and other weapons will present the Permanent Disarmament Commission with serious problems. These problems would be far harder to solve if scores of private armament firms throughout the world were actively engaged in trying to mislead the Commission's agents and defeat their efforts.

(d) The private firms would have an enhanced incentive to expand their diminished market by *qualitative* improvements in the arms they sell. The firms would be continually endeavouring to persuade their own and foreign Governments that, without exceeding their respective quantitative limits, they could increase their strength by scrapping their existing permitted weapons, and by substituting new and better models.

The continual application of scientific invention to armaments, and the unending stream of new and improved weapons which the private firms already produce to-day, show that this danger is a real one.

(e) The private firms have every incentive to arm a Government which is engaged on, or which is preparing, an aggression.

The fact that this aggression may involve a flagrant violation of international law and justice is of no importance to the private firms, whose sole concern is to do as much business as they can.

Advantages of State Monopoly under a Disarmament Treaty.

35. The disadvantages of Private Manufacture just described all arise from the fact that private capitalists engaged in arms-production must necessarily have a private interest—namely, increased profits—which would make them seek to induce Governments to spend more and more money on armaments, even if to do so the Governments must circumvent or defeat the purposes of the Disarmament Convention.

36. But this private interest would be in evident conflict with the public interest of the nation as a whole. For it would be the overwhelming interest of the nation—and particularly of a nation like ours, which desires always to fulfil its international obligations—that the Disarmament Convention should be scrupulously observed. It follows that if a Government abolished Private Manufacture and established a State monopoly of armament production, its interest would always lead it to exactly the opposite result from that produced by the interest of private armament firms.

37. For example:—

(a) A Government must always desire that foreign Governments should not secretly exceed the limits of their permitted armaments under the Disarmament Convention; for every violation of these limits will reduce its own relative strength as compared with the Governments which are guilty of such violation.

(b) On the assumption that foreign Governments are observing their disarmament obligations, a Government must always desire that its own national defence should lay the lowest possible burden upon the taxpayer. The Government has no motive for increasing expenditure, but exactly the reverse.

(c) A Government can have no conceivable interest in establishing illicit arms factories in countries where the administration is incompetent or corrupt. It is its evident interest, indeed, that no such factories should be established.

Under a system of state monopoly, moreover, there would be no trained personnel at the disposal of private capitalists to be placed in charge of such illicit enterprises. The Government would naturally prohibit its own employees, under severe penalties, from taking service abroad.

(d) A Government can have no interest in "qualitative improvement" in existing armaments.

To "improve" its own armaments must add to the burden of its unproductive expenditure, and must involve the risk that other Governments will follow suit in a new qualitative competition.

To sell "improved" arms to the Governments of other States would obviously be to add to their relative military strength at its own expense.

(e) A Government can have no interest in arming a foreign state that is engaged on, or is preparing, an aggression. On the contrary, its overwhelming interest is that world law should be everywhere observed.

38. Quite apart from the question of interest, it is inconceivable that a Government should take the responsibility of arming an aggressor or indulging in illicit trade. The risks of exposure would be intolerably great. The anxiety of the Italian Government to disclaim responsibility for arming Hungary a few years ago, is proof enough. It may be asserted with the utmost confidence that, if there had been no private armament firms in the world, Japan would have received no arms from abroad to assist her in her recent aggression against China, and that the Governments of Bolivia and Paraguay would not have received the arms from abroad without which their war in the Chaco could not have been conducted.

38a. The unfortunate results of the profit motive could, perhaps, be further mitigated if the system of control were extended beyond the proposals for licensing, publicity of orders, and international inspection, which are all that have been hitherto officially suggested. If, for example, private armament firms were subjected to the kind of measures now imposed on Public Utility concerns, whereby their profits are limited either directly or by fixing maximum prices, the private manufacturers of arms would have both less reason and less freedom to seek to circumvent or defeat the provisions of a Disarmament Treaty.

The successful working of any such plan would, of course, require full publicity of the correspondence and accounts of the private armament firms, and a stringent system of government inspection of factories, stocks, etc.

It can hardly be hoped that this plan would serve the public interest in regard to prices as well as the system of Government monopoly. For the administrative expenses of control would be considerable, while in fixing maximum prices a certain margin would always have to be allowed to the private

manufacturer. Thus unless the manufacturing methods of Government establishments were definitely less efficient, prices under such a system of control would tend to be higher.

38a. This plan of what I have called "Public Utility Control" would deserve more careful consideration if it had been officially put forward as an alternative to the abolition of Private Manufacture. And although it has not yet been officially proposed, I would venture respectfully to urge that if the Commission decided that it was impossible for them to recommend the abolition of Private Manufacture, at least so long as the conditions of present-day international anarchy endure, it might be desirable that they should recommend as an alternative this system of "Public Utility" control. If, combined with the other measures of licensing, inspection, etc., described above, this plan would certainly be of great value in mitigating some of the evil effects of the present system.

Conclusions.

39. But even if "control" were thus extended to include the fixing of prices or the limitation of the maximum rate of profit, it would still remain true that the private manufacturers of arms would have an interest to increase their sales. For that reason no system of control can wholly eliminate the social and political objections to the system of Private Manufacture. And so far as the other measures of "control" (i.e. licensing, inspection, etc.) hitherto discussed by Governments are concerned, I respectfully submit to the Commission that the considerations put forward above justify the conclusion that no such system can suffice to remove the major "evil effects" of Private Manufacture.

I submit:

(a) that under conditions of international anarchy such measures of licensing, etc., would obviously be wholly inadequate to the requirements of the situation;

(b) that even if they were combined with a system of international disarmament and supervision, the working of the profit-motive would remain, in the ways described above, a serious weakness.

I submit, therefore, that there is a *prima facie* case in favour of the abolition of Private Manufacture and of its replacement by a Government monopoly of the production of arms. I submit that this *prima facie* case ought to determine the main findings of the Commission, unless the Commission are convinced that there are important practical advantages in the system of Private Manufacture, or important practical difficulties in its abolition.

CHAPTER VII

The Alleged Advantages of a System of Private Manufacture

39a. I venture, therefore, to submit to the Commission the following examination of the alleged advantages of Private Manufacture and of the alleged difficulties involved in its abolition. For this purpose I have based my argument upon the contentions put forward by Government advocates of Private Manufacture in Parliamentary Debates, and in other official pronouncements on the subject.

39a. For greater convenience, I will arrange these contentions under the following headings:—

(1) The general advantages of industrial and commercial competition and of the profit-motive in the production of arms.

(2) The comparative prices charged to the national exchequer for armaments produced respectively by Government establishments and by private firms, i.e. the alleged heavy cost of the abolition of Private Manufacture.

(3) The advantages of progress in invention and design due to private enterprise and competition.

(4) The advantages of an export trade in arms.

(5) The increased capacity to expand national armament production in time of war alleged to result from the system of Private Manufacture.

(6) The difficulties of defining "armaments" for the purposes of the abolition of Private Manufacture.

(7) The difficulties of foreign trade under a system of Government monopoly: i.e. neutrality; the position of the smaller non arms-producing States; the supply of arms to Great Britain from foreign governments in time of war.

(8) The technical difficulties involved in the nationalisation of the armament industry.

Finally, I will conclude this Statement of Evidence with a summary of the recommendations which, I respectfully submit, it is desirable that the Commission should make to His Majesty's Government.

CHAPTER VIII

The General Nature of the Alleged Advantages of the System of Private Manufacture

Competition and the stimulus of private gain.

40. The general advantages which are alleged to be inherent in the system of Private Manufacture, as the result of the stimulus of competition and profit which it provides, have been admirably stated to the Royal Commission by an earlier witness, who has had wide experience of armament production in the service both of the Government and of private firms. In his Statement of Evidence, Sir Eustace Tennyson d'Eyncourt said:—

"The aspect of this question to which I specially wish to draw attention is the necessity of ensuring that war material should be of the best and most efficient design and construction. That this is a necessity is obvious, whatever the decision on the question of limitation of armaments may be; although it may be argued that the more limited the quantity the better still should be the quality.

"Having had experience with establishments manufacturing armaments, and with government departments, for nearly 50 years, I have been in a position to form an opinion on the subject; and as the result of the most careful study of the question, my considered opinion is that to abolish the private manufacture of arms altogether and put the whole thing under Government control would certainly not make for efficiency.

"There are many reasons for arriving at this opinion.

"*With private firms, not only is there competition between one firm and another—whether in the case of home firms against one another, or British firms versus foreign firms—but there is a strong incentive to individuals to find some new and improved devices which will not only help the firm for whom they work but will also improve their personal position with that firm. This is a consideration which does not exist to nearly the same extent in government departments.*"

41. Before considering Sir Eustace d'Eyncourt's claims concerning "efficiency" and the advantages of "a strong incentive to individuals", it may be useful to examine the more important part of his statement—that which relates to "competition between one firm and another, whether in the case of home firms against one another, or British firms versus foreign firms."

It is necessary to begin by inquiring how far there is any real competition in the armament industry.

42. First, what competition is there in the home market of an arms-producing country, e.g., in Great Britain?

Plainly competition does not work in the business of arms-production as it does in other departments of industry, for the practice of Government limits its operation in two important ways.

42a. First, it is an accepted principle of policy that the arms manufacturing capacity of Great Britain—i.e., the actual output of arms in time of peace—should be increased to the utmost possible extent. It follows that the Government must purchase all its arms from home producers. This has been declared in Parliament by Ministers of the Crown to be the accepted policy of all the Service Departments and, as reference to the relevant official statistics will show, there is virtually no import of arms into Great Britain. That is to say, there is no foreign competition of any kind. The same is true of all arms-producing States. Thus the Governments of these arms-producing States do not benefit by the international rivalry of private firms.

43. Second, Government practice limits the normal operation of competition within the home market. As was stated by a Minister in Parliament in 1928: "There are . . . all over the country great naval building establishments (i.e., the great private

firms) which in the interest of the country must be kept going We have to keep the dockyards in a state of efficiency and not let the private yards go out of use".*

With this in view, Government Departments endeavour to "spread" their orders. That is to say, they seek so to place their orders that as many different plants as possible may be engaged at least part-time on arms-production. This practice of "spreading" orders and the desire not to allow private plant to "go out of use" must plainly limit the operation of competition, must favour the growth of understandings and agreements among the firms which receive this favourable treatment, and must predispose the Government not to insist too rigidly on competitive prices or on the acceptance of the lowest tenders.

44. Moreover, there are special characteristics of the armament industry itself which makes it more liable than other industries to develop trusts, combines, or agreements. Thus:—

(a) The firms engaged in it suffer such violent fluctuations of prosperity—long periods of stagnation being followed by periods of rapid expansion—that new firms do not enter readily into competition with established firms.

(b) The importance of patents is enormous, for Governments insist on buying only the newest and most efficient types of arms; and established firms with strong Government connections are obviously much better placed than new or weaker competitors for securing patents for inventions.

(c) The nature of the market and the character of the salesmanship required must no doubt deter others from seeking to enter the industry.

(d) The extreme complexity of modern weapons and ammunition, the great number of different components required, the many kinds of expert skill and scientific knowledge needed for research, design and production, favour large and powerful combines.

(e) The importance of chemicals and steel favours vertical, as well as horizontal combination, and thus tends to eliminate the weaker firms.

For these reasons there has been in most arms-producing countries a tendency in the armament industry either to monopoly or to cartellisation. This has been notoriously true in the past of arms-production in Germany and France. And in Great Britain there has been for many years much less real competition than Sir Eustace d'Eyncourt's statement would appear to imply.

45. Even when there are a considerable number of firms, in appearance independent of each other and submitting competitive tenders for Admiralty or War Office orders, it is difficult to know whether they are not in reality working together behind the scenes. Even before the war many armament firms were linked together by inter-locking directorships. In a valuable study of the pre-war British armament firms, the late Mr. G. H. Perris showed that 15 persons held no less than 43 directorships in 14 companies. No doubt such arrangements must have led to a good deal of close co-operation between the firms in question.

But, as previous evidence offered to the Commission has shown, the whole armaments trade is now very closely connected with the general body of the iron and steel industry, the chemical industry, the electrical industry, and even the raw materials industries. Inter-locking directorships, share participations, control of apparently independent subsidiary companies, agreements to exchange patents, to concert with regard to prices, etc., have no doubt done much to limit free competition.

* Lt.-Col. Headlam, Financial Secretary to the Admiralty, in the House of Commons, March 22, 1928.

46. As long ago as 1907 a Government Committee, presided over by Sir G. H. Murray, which recommended a large increase in the proportion of orders given to private firms, nevertheless wrote in their Report as follows:

"With regard to other kinds of necessary supplies, including some of the most important and costly munitions of war, the operation of those economic principles which ordinarily determine prices is less certain.

"Not only are the sources of supply in these cases strictly limited, but demand also is limited. Government finds itself in the position of a consumer supplied by a limited number of producers, who enjoy something approaching to a monopoly; and effective competition can scarcely be said to exist.

"It is obvious that such conditions are favourable to the existence of understandings of a more or less formal nature, between the few firms who are capable of supplying the requirements in question; and experience shows that where Government is not in a position to manufacture for itself, full advantage will be taken of its necessities."

Describing the working of the armaments industry as he found it nearly ten years later, Dr. Addison, in his evidence to the Commission, said as follows:

"So far as I ever ascertained there was no effective competition between these firms as to price, whilst there were many evidences of a fairly close understanding between them."

In a speech made in the House of Commons on 8th November, 1934, Sir John Simon said:

"A nucleus of state factories is useful not only for the weapons that they themselves produce, but as a check on the prices and qualities of those produced by private companies."

This last statement of Sir John Simon's is no less significant or important than those of the Murray Committee and Dr. Addison. For if Government manufacture is useful "as a check on the prices and qualities" of the arms "produced by private companies," this means, and can only mean, that apart from Government manufacture there is not enough competition in the private trade to ensure high quality and reasonable prices.

It may be added that this argument for the maintenance of Government Arsenals has been used in Government pronouncements in almost every arms-producing country in the world, and that Sir John Simon's language was textually reproduced and unreservedly endorsed in a memorandum laid before Senator Nye's Commission of Inquiry by the War Department of the United States Government.

47. Whatever free competition may have existed in Great Britain when the Murray Committee made its Report in 1907, the field for the operation of that competition has certainly been narrowed since then. So far as I have been able to discover, the present situation is roughly as follows:—

Small Arms.

Only the Birmingham Small Arms Co. manufactures military rifles. Only Vickers-Armstrong and the Birmingham Small Arms Co. manufacture machine guns. The manufacture of small arms ammunition is virtually a monopoly of the subsidiary companies of I.C.I.

Artillery.

For most types of artillery Vickers-Armstrong are now the only firm in the field. Details of the guns they produce fill seven pages of *Brassey's Naval and Shipping Annual* for 1935. It is true that Brassey also gives a page to guns produced by Beardmore, including some of the same categories as those made by Vickers-Armstrong; but in fact Beardmore only manufactures gun-barrels, and virtually there is no competition except that of Government Arsenals.

Only Vickers-Armstrong produce gun-mountings. For many types of gun-mountings there is no production by Government Arsenals, and therefore no competition of any kind.

Gun ammunition.

Vickers-Armstrong and their subsidiaries appear to be the only firm producing many types of gun ammunition. Hadfields manufacture gun ammunition, and in particular some special types of naval armour-piercing ammunition, but in these special lines they appear to be without competitors.

Warships.

There are eight private yards which could lay down as large a battleship as is contemplated by naval authorities to-day, but according to an anonymous authority in "*Brassey's Annual*," "the only British private undertaking which can build a complete armoured ship out of its own resources is Vickers-Armstrong Ltd." This, no doubt, gives Vickers a great competitive advantage.

There are important financial and other connections between the owners of the eight private yards.

With regard to smaller ships, a number of firms specialise in them and share the orders. To the outside observer there appears to be genuine competition.

Only Vickers-Armstrong and Cammell Laird now make submarines, Beardmore having dropped out.

Armour-plate.

The same authority who has just been quoted, records in "*Brassey's Annual*" for 1934 that "For armour . . . dependence is on John Brown & Co., Sheffield, and the English Steel Corporation—which is, it will be recalled, a combination of the steel interests of Vickers, Armstrong-Whitworth, and Cammell Laird." Beardmore, however, still manufactures a small quantity. There is no Government plant, and plainly no competition.

Tanks.

Tanks used to be made by Vickers-Armstrong and by Armstrong-Siddeley. Apparently Armstrong-Siddeley have ceased production. There is no Government manufacture of tanks.

Explosives and Chemical preparations.

For high-explosives, for the substances required for poison-gas, and for the other agents of chemical warfare, the only producing firm is Imperial Chemical Industries, who have a complete monopoly of the private trade.

Aircraft.

In respect of aircraft there are, as has been shown in evidence submitted to the Commission, a considerable number of firms who compete for Government orders. Their competition, however, is limited in its effect by the practice of the Government in two respects:

(a) The Air Ministry in a certain measure pursue the policy of "spreading" their orders, as the Admiralty do. Thus the Air Ministry say in official correspondence with the Auditor-General:

"The need for the expansion of the Air Industry on a sudden emergency has further always to be borne in mind. The Council do not suggest that this could not be accomplished under a competitive system, but in present conditions it would undoubtedly demand considerable latitude in spreading orders, with resulting diminution of the full effectiveness of competition."

(b) For reasons connected with progress in design, something like 80 per cent. of the contracts placed by the Air Ministry are given not by the system of competitive tender, but by the so-called "single tender."

There is no Government manufacture.

48. It results from the above statement that for many of the "most important and costly" forms of armament and ammunition there is either virtual or absolute monopoly, in the hands of a single firm, or of a small number of firms between whom the connections are close. In respect of a considerable number of these products there is not even the "check" of manufacture in Government Arsenals. Even where that "check" exists, its operation must be greatly limited by the universal Government practice of giving the greater part of the available orders to the private trade.

49. The advantages to the British Government which result from competition are, therefore, extremely limited, since the competition of foreign purchasers is in principle excluded, and since there is, in respect of most kinds of armament-production, no competition among home producers.

49a. It may perhaps be argued, however, that the British firms are "kept up to the scratch," and that their efficiency and enterprise are stimulated, by their competition with foreign firms in the world market for the orders of foreign Governments.

50. Competition on the world market is, however, considerably limited. I venture to call the attention of the Commission to the following points:

(a) There is undoubtedly a considerable degree of international combination in the armaments industry effected by means of interlocking directorships, share participations, the control of subsidiary companies, exchange of patents, price cartels, etc. There have been a number of well-known examples of close international "rings," e.g.,

- (i) The Harvey United Steel Co., Ltd.;
- (ii) An arrangement made between German, Austrian and Belgian Small Arms Manufacturers in 1905;
- (iii) The pre-war combination between explosive firms connected with the Nobel industries;
- (iv) The patent and market-sharing arrangements between Vickers-Armstrong and the Electric Boat Co. of New York, etc.

As an example of the international connections which big armament firms tend to build up, the foreign interests of Vickers-Armstrong are shown in Annex A.

(b) I do not desire to suggest that these international arrangements among armament firms have eliminated all free competition in the world market.

On the contrary, it is certain that in many armament transactions the competitive bidding of rival firms is very keen.

(c) But what is the world market? As I argued before, it includes none of the arms-producing countries, i.e., the greater Powers, who between them purchase the overwhelming majority of all the arms produced in the world.

(d) Nor, for the most part, does it include non-arms-producing countries which have military alliances with arms-producing States, since the General Staffs of allied armies desire to furnish their troops, as far as possible, with identical types of arms and ammunition, and thus endeavour to secure them from the same source.

(e) It may, therefore, be doubted whether the effective world market in which there is real competition includes more than one-tenth of the actual world expenditure on arms.

Conclusions.

51. It may thus be concluded with some confidence that:

(a) For British armament firms there is little competition in the home market, except for that afforded by Government Arsenals;

(b) This Government Arsenal competition does not exist at all in respect of many of the "most important and costly munitions of war," while in respect of others its operation is severely limited by fixed practice of Government in "spreading" orders;

(c) In the world market the total amount of orders is so relatively small that competition is not a very important factor.

52. The Commission will be aware that allegations have been made that private firms have in the past endeavoured to secure the reduction of the output of Government Arsenals, and thus to limit the competition to which they are subjected.

CHAPTER IX

Would the System of Government Monopoly increase National Taxation?

53. It has been widely asserted that the abolition of Private Manufacture would involve the country in a great increase in national taxation. This contention is usually supported by the following arguments:

(a) That under Private Manufacture competition keeps down both real costs and prices of armaments;

(b) That if Private Manufacture were abolished, the Government would be involved in vast capital expenditure for new national arsenals to supply its annual armament needs;

(c) That Private Manufacture furnishes the country with large reserves of arms-manufacturing capacity and thus ensures that at a moment of crisis production of munitions could be very rapidly increased. If Private Manufacture were abolished this loss of potential reserves would, it is said, have to be met in one of two ways:

(i) The annual manufacture of larger stocks of munitions. This would not only add a large sum to the annual defence Budget, but would in itself be wasteful, because stocks are liable to deteriorate or to become obsolete; or

(ii) The building of large reserve factories which would stand idle in time of peace, and the maintenance of which would be extremely costly.

54. These various arguments may be briefly examined in turn:—

Comparative Real Costs of Government and Private Manufacture of Arms.

55. There is obviously a *prima facie* case for thinking that the real cost of Government manufacture of armaments should be lower or, in any case, not higher than the real cost in private firms. For if Government establishments had a monopoly of all armament production they would be able to realise economies in the following ways:—

(i) From the centralisation of administration, design, testing, inspection, etc., which could be effected;

(ii) From the centralisation and co-ordination of purchases of raw materials and component parts of all kinds;

(iii) From the long distance planning of output and factory organisation which would be possible.

56. This *prima facie* case would appear to be conclusive unless actual experience had shown that Government establishments are in practice wasteful; that their delivery is slow; or that, in other ways, they are technically inefficient.

I have not been able to find any evidence of this description and I suggest to the Commission that, if it existed, it would have been given wide publicity by those who defend the system of Private Manufacture.

57. There is, however, a good deal of evidence which testifies that Government establishments are at least as efficient as private firms.

For example, repair work is notoriously a test of efficiency, for in no department of industrial activity is waste more liable to occur. Speaking in the House of Commons, the First Lord of the Admiralty said of the Royal Dockyards:

"We (i.e. the Government) believe that as regards repair work they are more efficient than private yards or at least they do it for less expenditure."*

Coming from so authoritative a source, this is a strong testimony to the efficiency of Government establishments. This testimony, which is fully confirmed by the Reports of the Murray and McKinnon Wood Committees, is further supported by the fact that it is the established practice in all the Fighting Services to send all repair work to Government factories and yards.

* Hansard, March 22, 1923, Col. 2882.

58. The same view is supported by the experience of the last war. The Commission will remember that in the statement of evidence submitted by Dr. Addison there appeared (Exhibit C) the Minutes of a Committee held at the Ministry of Munitions on 24th January, 1916. The members of the Committee were:—

Mr. S. H. Lever.
Hon. N. Charles Rothschild.
Mr. John Mann.
Mr. Frederick Palmer.

Paragraph 9 of the Minutes reads as follows:—

"9. *Conclusion re armament firms.*—The only conclusion that can be reached at present is that:—

(a)

(b)

(c) *The organisation and management of their works are inferior to those of other shell manufacturers.*"

59. There is further evidence in support of this view from individual engineering firms who during the War were first offered sub-contracts by private armament firms and afterwards undertook similar work for the Ministry of Munitions under the guidance of Woolwich Arsenal. Their view was that the methods of the Private Firms were cumbrous and wasteful, while many firms expressed great satisfaction with Woolwich methods.

60. There is much further evidence in favour of this view to be drawn from the experience of the national factories established by the Ministry of Munitions during the War. No doubt it is true that war conditions differ greatly from peace conditions, but there is no reason for thinking that the economies realised by the national factories in time of war might not in some measure be realised also in time of peace and that, therefore, the real costs of Government manufacture will tend to be less than those of manufacture by private firms.

Comparative Prices of Government made and Privately made Armaments.

61. There is an even stronger *prima facie* case for thinking that the prices charged by Government Arsenals for their products will be lower than the prices charged by private firms. This is true for the following reasons:

(a) Government establishments do not need to allow in their price for the cost of competitive advertisements or for other selling costs;

(b) As shown above, there is very little real competition between the private firms;

(c) Both nationally and internationally such competition as would otherwise exist has been highly restricted by the formation of rings and cartels.

(d) Thus the private firms are virtually in a monopolistic position and are able to charge prices that more than cover their full costs, including normal profits. Thus if Government establishments and private firms are equally efficient and have equal costs of production, it is to be expected that the Government will have to pay more when they buy from private firms. This is not an extra real cost in the sense that it uses up the real resources of the nation. But it is an extra charge to the budget, and in effect a ransom levied by the firms on the taxpayer.

62. This *prima facie* case is reinforced by the authoritative statements by the Murray Committee, Sir John Simon and others, which have been referred to above. In these statements it has been officially declared that Government Arsenals are required as a "check" on the prices charged by private firms and in order to furnish a standard for the quality of their products. Such statements are really decisive in themselves on the question of comparative prices. For obviously it cannot be argued

both that the taxpayer will obtain his armaments cheaper and of better quality from private manufacturers than from Government factories and that the cost of production and quality of goods made by Government factories provide a standard which can be used to control the prices asked and the quality of the goods supplied by private firms.

The Evidence of Actual Experience.

63. In view of current misconceptions, however, it may be useful also to consider such definite information as has been published concerning the actual prices charged respectively by Government factories and private firms.

64. It is, of course, true that this information is fragmentary and that, therefore, it can do no more than give certain general indications, the value of which I do not desire to overstress. It is a remarkable fact that, so far as I am aware, no comprehensive study of these comparative prices has ever been made. The most comprehensive official information on the subject comes from the United States of America. It may most usefully be summarised by reproducing extracts from official evidence given by the United States War Departments to Congressional Committees of Inquiry.

65. Experience in the United States of America.—

In 1915 the Secretary of the United States Navy, Mr. Daniels, said as follows:—

"Contrary to the popular idea, the Navy Department in what it manufactures does so, from a superdreadnought to a gallon of paint or a pound of powder, *cheaper* than the same can be purchased. This is particularly true of gasoline engines, electrical supplies, engines for dreadnoughts, shrapnel, clothing for marines and sailors, accoutrements, and a multitude of other articles required for the fleet and shore stations."

66. In a memorandum of evidence presented by the United States War Department on 21st December, 1934, to the Senatorial Committee presided over by Senator Nye, the following paragraph appears:—

"In time of peace, Government arsenals can manufacture at slightly less cost than commercial facilities. It has been estimated that this saving will average 11 per cent. The difference is due in large part to the following factors:—

(a) Arsenals make no allowance for profits.

(b) Overhead expenses are slightly lower in the arsenals and there are no selling costs.

(c) Depreciation charges are less in the arsenals because there is no question of future business. Sporadic Government orders necessitate private plants entering a relatively high depreciation charge against each order."

67. In evidence given to various Congressional inquiries certain other detailed information with regard to the comparative prices charged for specific articles has been published. I may, perhaps, summarise this evidence, which is taken from the official Congressional Proceedings, in the following table:—

Year	Article.	Government Arsenal Price (Including overhead charges).	Private Manufacture Price.
1912	3" Shrapnel Case	\$1.75	\$3.06
"	2.8" Shrapnel	\$7.94	\$17.50
1913	4.7" Shrapnel	\$15.45	\$25.26
1915	Smokeless Powder	\$0.36 per lb.	from \$0.63 to \$0.80 per lb.
1887-1916	Armour Plate	Average of 9 different official estimates of cost: \$247 per ton	Average price paid over this period to private firms: \$440

68. *British Experience*.—There has been much less official inquiry into this subject in Great Britain than in the United States. The information is, therefore, still more fragmentary and is, in fact, mostly derived from answers to casual parliamentary questions. A few scattered examples may be given:—

(a) In 1893 the Secretary of State for War declared that the price, including royalty, of machine guns made in the Ordnance Factory at Enfield "compared favourably" with the price paid to the private company;

(b) During the period 1889-1904 the average prices charged for rifles by the Ordnance Factories and the Birmingham Small Arms Factory were as follows:—

Royal Ordnance Factories.	B.S.A. Company.
Enfield.	Sparkbrook.
£3 3s. 2d.	£3 7s. 7½d.
	£4 3s. 9d.*

(c) Similar figures for other articles are:—

Sword-Bayonets.	
Enfield.	Private Firms.
7s. 11d.	11s. 5½d.

<i>Cavalry-Swords.</i>	
<i>Enfield.</i>	<i>Private Firms.</i>
19s. 8 $\frac{3}{4}$ d.	£1 2s. 9 $\frac{3}{4}$ d.†

(d) In 1907, Dr. Gilbert Slater, acting on behalf of the Woolwich Joint Conference on Discharges from the Arsenal published in "The Times" the following table of comparative prices:

Articles.	Woolwich.	Contract Work.
	£ s. d.	£ s. d.
18 pounder gun-carriages ...	343 14 4½	672 7 0
13 pounder gun-carriages ...	400 3 6	631 19 0
18 pounder limber carriages	99 0 1	197 5 6
13 pounder limber carriages	108 9 2½	182 16 0
18 pounder limber wagons ...	107 9 7	283 12 1
13 pounder limber wagons ...	118 5 5	184 0 0
Torpedoes ...	362 0 0	584 0 0

Although the system of Private Manufacture was at this time the subject of acute controversy, Dr. Slater's figures were never challenged.

(e) With regard to Armour Plate, there has never been any Government manufacture in Great Britain, but the spokesman of the Admiralty admitted to a Select Committee in 1912 that the prices charged by British armament firms for Armour Plate were higher than they should have been.

69. *French Experience*.—That French Government Armament Factories charge lower prices than French private manufacturers is shown by the following statement by M. Pierre Cot, who was Minister of Air in France in 1933-34:—

"In the course of the year 1933, at the instance of the Daladier Government, the French Ministry of Finance undertook a study of this question. It was sought to discover whether the French Treasury could, without incurring excessive charges, buy up and nationalise the private manufacture of arms. M. Georges Bonnet was Finance Minister, and he reached the conclusion that the acquisition was possible without laying any extra burden at all upon the French taxpayer. M. Georges Bonnet contemplated meeting the costs of acquisition through the issue of Treasury bonds; a similar system had been employed by the French State to liquidate part of the commitments involved in the reconstruction of the liberated areas. Interest and amortisation of these bonds would have been largely covered by the economies achieved in the arms-market, with the result that without extra expense the State would have become the owner of valuable factories, and thereby have brought off an excellent bargain. That, it is true, is not the main reason for the nationalisation of the arms manufacture, but it is not irrelevant to emphasise the fact that the

mere financial interest of the State points to nationalisation." (14th December, 1934.)

70. I submit that the above evidence justifies the conclusion that Government arsenal prices are likely, under a system of Government monopoly, to be lower, or at least no higher, than the prices now charged by private armament firms in time of peace.

71. *Experience in Time of War*.—The Commission has already received much evidence showing that during the last war the prices charged by private manufacturers were very much higher than those charged by Government arsenals and factories. It is indeed certain that the economies which resulted from the large scale establishment of national factories by the Ministry of Munitions, and from their competition with the private armament firms, amounted to hundreds of millions of pounds sterling.

72. A good deal of censure has been passed upon the private manufacturers for exploiting the needs of the Government and charging prices that were far above their costs of production. Some of this censure may be justified, but it must be said in defence of the private manufacturers that such over-charging was an almost inevitable result of the system then in force. For the private manufacturers were being called upon very greatly to expand their production. To do this they were obliged to build new factories and to sink large sums of capital in new and costly plant; they had no idea how long the war would last; it was the general view that it would be comparatively short; Government could give them no guarantee that they would receive orders for their new factories when the war was over; it was inevitable, therefore, that they should endeavour to recover their capital expenditure in the shortest possible time by charging the highest possible prices which Government could be induced to pay. The Government was in no position to bargain about prices, since their demand was far greater than all the available sources of supply could meet.

73. It was, therefore, almost inevitable that the private manufacturers' prices should have been greatly inflated during the early part of the last war, and if the same system obtained, the same thing would happen if another war broke out. This fact is a strong reason in favour of establishing Government monopoly in time of peace. For expenditure in time of war is on so incomparably greater a scale than expenditure in time of peace, that it would be good economy to adopt a system which is cheaper in war-time even if it could be shown that it was more expensive in peace-time.

Would New Arsenals be Required?

74. It is next argued that the abolition of private manufacture would involve the building by the State of a large number of costly new arsenals in all quarters of the country. To this argument I would reply as follows:—

75. The amount of armament plant required depends upon the armament demands of the Government. If a Disarmament Treaty were made, and particularly if this Treaty involved a large reduction or the total abolition of national Air Forces, the existing Government arsenals and dockyards would almost certainly be able to supply the nation's needs without great addition to their present capacity. If, however, expansion of their present capacity were required, there would be no difficulty in taking over at a valuation the specialised armament plant and factories, which private manufacturers now possess.

76. If, as is possible, the Government decided that the distribution and organisation of the existing private factories is inefficient, the specialised machinery could be placed either in the existing Government factories or in new factories to be built.

The Commission is no doubt aware that Woolwich Arsenal to-day employs approximately 8,000 men, while in 1918 it employed over 74,000. It has been estimated that the total number of men employed in private armament manufacture amounts, approximately, to 25,000. There is thus room at Woolwich for an expansion which would meet all the possible requirements of the Government.

* These figures are given in the Murray Report, Cd. 3626, 1907.

† Cited by J. Walton Newbold, *The Labour Leader*, July 31, 1913.

77. If new plant and machinery are, in fact, required, the capital expenditure could probably be wholly met, as, according to M. Cot and M. Bonnet, it could be met in France, by the economies which would follow from the lower prices which the Government factories charge.

This second argument, therefore, also appears to be without foundation.

The Increase of Reserve Armament Plant.

78. It is further argued that if private manufacture were abolished the Nation would lose the reserves of armament plant which the private firms now maintain, and that the Government would be obliged, in the national interest, to make good this loss in one of two ways:

(a) By increasing stocks of arms and munitions maintained in time of peace.

(b) By increasing the reserves of armament plant in Government arsenals and thus adding to the existing reserve machinery which stands idle. It is said that either of these plans will cost the Treasury large sums of money.

79. With regard to this argument, the following observations may be made:

(a) Of the two methods proposed, it may be assumed that the Government would desire to adopt the least costly. This would appear plainly to be the method of increasing reserves of machinery, since to increase stocks of arms and munitions is liable to be wasteful, since such stocks may easily deteriorate or become obsolete in type.

(b) How expensive would it in fact be to increase the reserves of armament plant in the way proposed? In Great Britain no official calculation has been made on this subject, as far as I am aware. But in the United States War Department's Memorandum cited above, it is said that the abolition of private manufacture would have the following effect:

"The enormous carrying charges on reservation facilities would more than double present costs, i.e., instead of costing 11 per cent. less, current supplies would cost from 90-100 per cent. more, than if procured commercially."

This calculation, however, is based on the assumption that the plant of private industries would not be used for producing war material in time of war and that, therefore, the United States Government would have to build in time of peace the additional arsenals required to furnish the arms and munitions needed by an army of not less than four million men. The initial cost of this new Government plant was estimated by the War Department to be \$1,000,000,000, and the annual maintenance charge 18 million dollars. This sum, the memorandum says, would be a net addition to the cost of national defence.

(c) It need hardly be said that no one in this country has proposed any such plan as here envisaged. It is, on the contrary, assumed that the Government would, directly war broke out, carry through an industrial mobilisation of private industry, as it did during the last war. In so doing, it would no doubt take whatever measures might be required:

(i) To secure effective Government control of all armament production.

(ii) To limit the profits made by private manufacturers.

In other words, there is no suggestion that all armament production should be confined to Government Arsenals in time of war; on the contrary, the abolition of Private Manufacture in time of peace would not affect the fact that the general engineering industry of the country would furnish the same reserves of non-specialised plant as it would if the present system continued.

(d) Thus the Government would only have to ensure that the country's total reserves of specialised armament machinery were the same after the abolition of Private Manufacture as those which now exist. If it added to national arsenals

the same quantity of such plant as now exists in private factories, the power of the country to expand armament production at a moment of crisis would remain at least what it is to-day.

(e) The question now to be answered, therefore, is whether such additions to the existing Government reserves of specialised machinery and plant would involve very heavy additional expenditure to the Exchequer.

(f) When this question is discussed, it is usually assumed that the specialised armament plant now maintained by private manufacturers cost the taxpayers nothing, and that when it is idle the private manufacturer pays the cost.

If it were true that the private manufacturer paid the cost, it would be a most unjust return for the service of armament manufacture which the Government encourages him to undertake. Some part of paying this cost may, perhaps, be paid by the private manufacturers; at least they make frequent complaints on the subject. The nation, however, pays much the greater part. Thus:

(i) Government pays direct subsidies to help to meet the maintenance charges on idle plant, e.g., in 1928 a payment of £90,000, was made to five British companies which manufacture armour plate;

(ii) These charges are also allowed for in fixing the higher prices paid to private firms;

(iii) Some armament enterprises receive a privileged position, e.g., Imperial Chemical Industries has a monopoly of many products in the British market. This monopoly enabled Imperial Chemical Industries to show a large increase in profits during the three worst years of the world depression. It can hardly be doubted, therefore, that British citizens pay an important indirect subsidy for the increased national security which Imperial Chemical Industries provides and for the increased reserves of plant for war production which it maintains;

(iv) It must be remembered further that the private manufacturer is furnished without payment with the results of Government research. This, no doubt, is a further "disguised" subsidy of an important kind.

(g) In view of these facts, the next question to be answered is this: Is there any reason for believing that the cost of maintaining additional reserve plant in Government arsenals would be greater than the present cost of inducing private manufacturers to keep such plant by the direct and indirect subsidies just described?

In answering this question, the following points appear to be relevant:—

(i) To keep extensive specialised plant standing idle means locking up capital in unproductive investment. The cost of so doing must depend on the rate of interest to be paid. Government borrows at a lower rate of interest than private firms. This, of course, is offset by the fact that the taxpayer has to bear the risk of future loss instead of a private firm doing so; but there is probably some real saving to the Exchequer.

(ii) The plant must be housed in a factory on which a private firm must meet current charges, rent, interest, etc. The Government already possesses large arsenals, sites, and numerous empty shops on which no charge except depreciation would need to be paid. For a certain time after the reserve plant was transferred to Government arsenals, an economy would thus be made.

(iii) The plant must be kept in good condition by unskilled labour working under expert direction. It is probable that the Service Departments could, without extra salary and wage charges, furnish both the labour and the expert staff required from persons already in their employ whose time is not now fully occupied.

Thus it seems probable that the costs of interest, rent and administration would all be less on reserves of idle armament plant kept in Government factories than on similar reserves kept by private firms.

Note.—In this discussion I have omitted the point that the maintenance charges on reserve plant may partly be paid for by the profits on arms manufacture for the export trade. This is discussed in paragraph 106 below.

(h) The above considerations justify the conclusion that the abolition of Private Manufacture would not involve the Exchequer in heavy expenditure for the maintenance of additional reserves of arms-manufacturing machinery and plant.

79a. For greater clarity, the above argument may be summarised as follows: If £2 worth of reserve equipment has to be held in any event for the needs of war-time, it makes no difference whether it is held in Government arsenals or by private firms; because, if it is held by private firms, the Government will have to pay for it in the prices charged by the firms or by direct or disguised subsidies of different kinds.

Against this, however, must be set the point that if this plant can be used by private firms in its spare time for making arms for export or "peaceful" goods, but can *not* be so used by Government, then there is *pro tanto* a real economy in the system of Private Manufacture, because the plant has to be kept idle for a smaller proportion of its time. How far this is a real advantage of Private Manufacture is discussed in paragraphs 106, 192 and 193 below.

Conclusion.

80. It follows from the above argument that there is no sound reason for thinking that the abolition of Private Manufacture would increase either the real burden on the nation or the cost of national defence to the Exchequer. On the contrary, it appears probable that:

- (a) the real costs of production,
- (b) the prices charged to Government, and
- (c) the cost of maintaining reserve-plant for war-needs

would all be less under a system of Government monopoly than they are under the existing system.

CHAPTER X

The Alleged Advantage of Private Manufacture in Promoting Progress in the Design of Armaments

81. One of the principal contentions in favour of Private Manufacture laid before the Commission by earlier witnesses is that the incentive of private enterprise and private gain tends to promote progress in design.

Thus Sir Eustace d'Eyncourt stated that he desired "specially to draw attention" to "the necessity of ensuring that war material should be of the best and most efficient design and construction", and he argued that "right through peace and war you have to keep up the whole idea of keeping the initiative in invention". He further declared that "in the ordinary way the government arrangements are very clogging for developing a new idea", and that in consequence "most of the great inventions come from private individuals".

Similarly, Mr. Douglas Vickers in 1931 claimed that in this respect "a private firm had great advantages over a State factory. A private firm had to go out into the world and meet competition, and they got to know in this way what was up against them and what they had to beat. This sharpened their wits".

How the Stimulus of Private Profit is alleged to work.

82. Three arguments—or, more accurately, three variant expressions of one argument—are advanced in favour of the view that the stimulus of private gain tends to promote progress in design.

(a) It is said that private firms must obviously have the keenest possible desire to secure and launch new inventions, since there is an unfailing, an immediate and virtually an unlimited, market for new types of armaments. This is more true of armaments than of any other product, for the reason that new or powerful weapons very quickly drive less efficacious weapons out of use. The private manufacturer of arms can thus increase his business by securing new patents, or by improving the power and efficacy of existing weapons, more certainly than he can increase it by any other means.

(b) It is said that in order to retain their clientèle, a private armament firm must always strive to keep ahead of rival firms in the improvement of design, since Governments insist on obtaining the most efficient weapons, irrespective of cost.

(c) It is said that if the Government purchased all warlike material from State factories, the result might be complete stagnation in respect of design, since the State servants in Government factories,

being without the profit motive, would have no incentive to change or improve existing types. In modern conditions, where science is changing not only individual weapons, but perhaps the whole character of warfare, with great rapidity, such stagnation in design might lay the nation open to defeat in a future war.

Do the interests of the Private Manufacturers and the interest of the Nation in this matter coincide?

83. It is usually assumed without argument by those who put forward the above contentions that in the matter of design the interests of private manufacturers and of the nation will always coincide. But it is not *a priori* certain that this is true, for the interest of a private firm is profit, while the interest of the nation is security.

It may, therefore, be worth while to examine the possible conflict of these public and private interests, and to do so on the basis of the various hypotheses which the Commission have to consider, i.e.:

- (a) Under conditions of international anarchy and armament competition;
- (b) In time of war;
- (c) Under a system of organised international disarmament and peace.

84. *International anarchy and armament competition.*—It is plain that in the conditions of international anarchy the private manufacturer has as a rule a great incentive to secure new patents or to improve the weapons which he possesses. For example:

(a) The acquisition of the patent for the Maxim machine-gun was the true foundation of one of the most powerful armament corporations in the world. The financial return which may follow from the acquisition of such a patent is shown by the fact that the British Government, during the war of 1914-18, furnished its troops with no fewer than 250,000 machine-guns, at an average cost of probably not less than £100 apiece.

(b) Similarly, the private manufacturer has an interest in making improvements and developments in existing types of arms, in order to increase their complexity and their cost. In the armaments industry there is an almost limitless field for improvements of this kind. A good example is furnished by the development during the last twenty years of the 6-inch gun cruiser. When war broke out in 1914, the standard light cruiser of the British fleet was the Birmingham type, of 5,440 tons displacement. Its cost was

approximately £350,000. The modern equivalent of the Birmingham is the Leander, a 6-inch gun cruiser launched in 1933. The Leander has only approximately 2,000 tons greater displacement than the Birmingham, and on paper its armament is much the same. But the cost of the Birmingham was £1,627,819.* The cost of the propelling and auxiliary machinery had increased from £135,000 to £435,000; while the cost of the guns had increased from £50,000 to £500,000.

85. Thus as a general rule private firms have a great financial inducement both to promote new inventions and to make improvements in existing types of arms. But there are also two other points which they have to consider.

(a) They naturally desire to find as many purchasers as they can. They therefore take out patents for their new inventions in all foreign countries where they can hope to induce the Government to buy.

(b) They must sometimes find that it is to their interest to suppress a new invention or improvement. The invention may simplify, instead of complicating an existing weapon; it may reduce its cost; it may make a large and costly plant obsolete; or it may render useless some other weapon more costly than itself. This would happen, for example, if the present experiments in torpedo attack carried out by aircraft and by small motor speed-boats were to render obsolete the super-dreadnought type of armoured ship. It frequently happens in ordinary industrial experience that inventions are suppressed. Dr. Addison declared to the Commission that it happens no less frequently in the armament industry, and that even in time of war there were many valuable ideas which were not adopted until the Ministry of Munitions took them up.

Now it may obviously happen that on both of these two points the interests of private manufacturers and of the nation may be in conflict. A new weapon may bring profit to the manufacturer but danger to the country. I may perhaps cite a practical example. The accepted Government view is that command of the sea is no less important than it was in pre-aviation days, and that our Battle Fleet of armoured ships is the essential factor in giving us that command. If this be true, the new Hadfield "Relieved-Base" armour-piercing shell might, in the hands of an enemy, be a serious menace to British safety. It is, therefore, in the interest of the nation that that shell should be kept secret for the use of the British fleet alone. But in execution of their duty to their shareholders, the Hadfield company have patented their shell in eight foreign countries. The same remarks apply to a new torpedo for use from aircraft which has been introduced by Whiteheads, and which that company have offered for sale to all Governments abroad.

86. Thus, in conditions of international anarchy the interests of the private manufacturers may conflict with the interest of the nation in the following ways:

(a) The private manufacturers may desire to suppress an invention which it would be to the military advantage of the nation to develop.

(b) The private manufacturers may desire to develop an invention which it would be to the military advantage of the nation to suppress.

(c) The private manufacturer may desire to sell to all foreign governments the new weapons which he may produce, although it may be—and usually will be—to the military advantage of the nation to keep these weapons as a secret for itself.

87. *In Time of War.*—It is not clear that even in time of war the interests of the private manufacturers and of the nation in the matter of progress in design will be the same. The History of the Ministry of Munitions says as follows:—

* A small part of this difference was no doubt due to a change in price-levels, but not enough seriously to diminish the value of the illustration given.

"In times of peace the War Office had relied almost entirely upon the Ordnance Factories and the armament firms for the origination of patterns which needed the skill of the expert combined with the manufacturer's knowledge of workshop practice. When hostilities began, these same factories were the sole source of output. The interests of immediate production were paramount, and experimental work took a second place . . . Moreover, small experimental orders must necessarily have been less attractive to armament makers than the contracts which were being placed for manufacture on a large scale."

A possible conflict of interest may thus arise. The military Command will desire that any possible new weapon which will give them the advantage of surprise shall be developed. But, at a time when the private manufacturer finds an unlimited demand for everything he can produce he will, almost certainly, make more profit by large scale contracts for standard products which require no change of plant, material, or organisation, and no other incidental expenses of any kind. We cannot, therefore, trust the profit-motive to operate in time of war as a stimulus which will certainly lead to maximum military advantage in respect of progress in design.

There is thus a case for holding that on grounds of theory the interest of the Government in new inventions will be keener than that of private firms, and that, in so far as private firms introduce inventions and improvements they will do so rather for patriotic reasons than for the sake of additional profit. This case is strongly supported by Dr. Addison's evidence to the Commission.

88. *Under a System of Organised International Disarmament and Peace.*—But the conflict of interests between the nation and the private manufacturer in respect of progress in design is most evident under a system of organised disarmament and peace. Under such a system, indeed, their interests would be, in all cases, diametrically opposed.

The purpose of a disarmament treaty is two-fold:—

(a) To establish a permanent international equilibrium of strength by the stabilisation of the armaments of the signatory States at the lowest level at which agreement can be reached.

(b) To relieve each signatory State, by a system of international control, from its present anxiety that neighbour States may gain a secret advantage in military strength.

To make it possible to achieve this two-fold purpose, it is essential that competition in quality of armaments should be prevented. To do this would require a special clause in the Disarmament Treaty prohibiting the signatory States from introducing improved or more powerful weapons. The Polish Government submitted proposals for this purpose to the Disarmament Conference, and they also suggested a special machinery of control.

Such arrangements would obviously promote the interests of every nation which, like Great Britain, intended loyally to observe the obligations of the Disarmament Treaty, and which, therefore, must desire that other Governments should also do the same. But they would strike a serious blow at the interests of private manufacturers. For, as I said in paragraph 34 (d) above, the best hope of expanding their business which private manufacturers would have under a Disarmament Treaty would lie in new inventions and in changes of pattern and formula, which might induce Governments to replace their existing permitted stocks of war material. Private manufacturers would thus have an inducement to defeat the purpose of the Disarmament Treaty at the cost of damaging the interests of every signatory nation, including their own, which loyally observed its terms.

* History of the Ministry of Munitions, Vol. IX, Part II, pp. 45-46.

An obvious example of how this might happen is furnished by the provisions of the Versailles Treaty which forbade Germany to maintain ships of more than 10,000 tons displacement. The Commission will remember that the German designers invented processes by which their 10,000 tons ships had an equal strength in horse-power, armament, etc., with all previous vessels of 13,000 to 14,000 tons. Qualitative competition of this kind would both upset the equilibrium which a disarmament treaty is intended to establish, and would involve Governments in the useless expenditure of great sums of public money.

88A. *Conclusions.*—It may be concluded, therefore, that in many different ways the working of the profit motive in the armament industry does not coincide with the interest of the nation in respect of progress in design.

Have Private Firms a Better Record than Government Departments in respect of Progress in Design?

89. It must next be asked whether it is true on the facts of history that private firms have been responsible for more inventions and improvements than Government arsenals or departments.

So far as I am aware, no systematic historical study of this matter has ever been made by any Government or private authority. As far as I have been able to assemble the facts, I have not found sufficient justification for the broad statements that are made in favour of the private firms. The authors of these statements usually assume that all credit for any invention or improvement associated with the name of a private firm must be given to that firm. But, in fact, it is at least open to question whether in many cases the credit should not go to others.

In this connection I draw attention to certain of the most famous cases on which are based the claims made for private manufacture in this respect.

(a) Sir W. G. Armstrong was a distinguished inventor of naval ships and guns. Before he founded the enterprise which was destined to become one of the greatest armament firms in the world, he had been in the employment of the Government at Woolwich Arsenal.

(b) Similarly, Mauser left the service of a German State factory to manufacture the rifle by which he made his fortune and his fame. He had designed this rifle while he was in Government employ.

Should the credit for the production of these two inventions be given to the private firms they founded or to the Government arsenals in which they received their training, learned their technique and, in a certain measure at least, made their plans?

(c) During the last war the paravane was invented by Commander Burney, who took it to Vickers to be exploited. Commander Burney was a naval officer and an employee of the State. In what sense can the firm of Vickers claim credit for his invention? Can it be believed that if there had been no private armament firms he would not have taken his paravane to a Government arsenal? Can it be doubted that a Government which bought Sir W. G. Armstrong's guns from Elswick would have refused to allow him to make them if he had remained at Woolwich?

90. It has sometimes happened that private firms have exploited for their profit new designs made in Government arsenals and research departments. A famous case is that of the Buffington-Crozier disappearing gun carriage. General Buffington, then Chief of Ordnance in the United States Army, designed and constructed a gun at Government expense in Government gun shops, spending hundreds of thousands of dollars in experiments to perfect the gun carriage. The Bethlehem Company then made a secret contract with General Buffington and his co-inventor, Captain Crozier, and patented the gun carriage in many foreign countries. The facts concerning this case were exposed in the American House of Representatives by Congressman Claude H. Tavenner in 1915. In what sense can the Bethlehem Company claim credit for this invention?

91. These few examples show that it is exceedingly difficult to justify any general claim that private firms have a much better record than Government Departments in respect of progress in design. This was true even before the War; it must be much more true to-day when public expenditure on Government armament research is on a far greater scale and when the results of that Government research are frequently placed at the free disposal of private firms.

How Progress in Design is effected.

92. Apart from this unsubstantiated historical contention that private firms have a "better record" than Government Departments and arsenals, is there anything in the nature of progress in design which supports the argument now being discussed?

Progress in design means change in the nature, type or construction of weapons and munitions which renders those weapons and munitions more powerful for the destruction of enemy troops or their defences, communications, etc.; which renders these weapons or munitions more mobile or easier to use; or which makes them simpler in construction or less in cost.

Such progress may be brought about by change so considerable as to justify the use of the word "invention"; or it may be brought about by gradual minor improvements in existing types.

Invention may mean the production of some entirely new kind of weapon, e.g., the tank, or poison-gas; or so great an increase in the efficiency of an existing weapon as to render all previous models obsolete as, e.g., the Maxim gun made the Gatling and Nordenfeldt machine guns obsolete. Such inventions are frequently made by men of genius not regularly engaged in armament work.

Improvement, as distinct from invention, is the result of the gradual adoption of minor new devices, suggested as a rule by the experience of those who are regularly engaged in the work of armament research, experiment, repair or manufacture.

93. I call the attention of the Commission to the following points:—

(a) Progress by either method usually results from scientific research and practical experimentation. Modern armaments are so complex and the precision required so great that both research and experimentation are very expensive. Prior to 1914 a considerable part of the research and experimentation carried out was done by private firms; now there is no major military Power in the world that does not devote to this purpose sums amounting, at least, to hundreds of thousands of pounds a year.

(b) Research and experimentation give the best results when they are carried on in close conjunction with the practical work of manufacture for large scale production and with the work of repair.

(c) Experimentation often requires the active help of the Armed Forces and the use of Government ranges, training and testing grounds, etc.

94. At the present time, both armament firms and the Government concern themselves with promoting progress in design.

I have not been able to discover any comprehensive published data concerning the amount of research and experimentation which is done by private manufacturers, or what sums they devote to these purposes. The following points, however, may be noted:

(a) All armament firms keep drawing offices for design proper on a larger or smaller scale.

(b) Some armament firms, including the more important, devote considerable sums to research and experimentation. Sir Robert Hadfield, himself a distinguished scientist and researcher, has described the research work done by his firm. According to "Brassey's Naval Annual", most warship-building firms spend something on research.

Imperial Chemical Industries maintain research laboratories.

Most aircraft firms do little, if any, research, but a number of them do a good deal of experimentation with new models. Part of this experimentation is financed by public money.

(c) Most of the results obtained by Government Research Departments are placed at the disposal of the private firms.

(d) The private firms receive facilities from the Services in their experimental and testing work, e.g., the use of ranges, training-grounds, troop co-operation, etc.:

(e) Some of the private firms have an obligatory option on inventions made by persons in their employ:

(f) Private firms, of course, accept, and indeed are extremely anxious to secure, new inventions brought to them by those not in their employ.

95. The Government also takes part in work of promoting progress in design in the following ways:

(a) It maintains research stations and establishments at a large cost to the Nation. Details of the work done in research and experimentation are shown in the following tables:

(i) *Army:*

£342,933 £325,238 19 5†

(iii) *Air.*

Extract from the Memorandum on the Air Estimates presented to Parliament by the Secretary of State for Air in 1934.

"The provision for experimental services (shown in Appendix I) is £1,428,000, an increase of £43,000 on the figure for 1933. There is an urgent demand for further research and development work which can no longer be postponed.

"The gross expenditure on the Royal Aircraft Establishment at Farnborough amounted to £385,791 1s. 3d., £325,000 of which went for experimental and research work."‡

(b) The Government take an option on the inventions made by persons in the employ of Ordnance Factories and other Government establishments;

(c) They also receive inventions from outside sources;

(d) They stimulate the flow of inventions by giving rewards to those who put forward useful

ideas. In the years 1932-33, these rewards amounted to the following total:

	£
Army	—
Navy	10,502
Air Ministry	19,263
Total	£29,765

(c) Woolwich Arsenal maintains a large Drawing Office which keeps in close touch with the research stations under the control of the War Office.

(f) The Admiralty maintain a Royal Corps of Naval Constructors who receive and approve suggestions made by private firms and decide upon their incorporation in new vessels to be built. The Royal Corps of Naval Constructors is responsible for the designs and construction of all new vessels for His Majesty's Navy.

(g) The Air Ministry, on the other hand, consider that design is better left to the competition of private firms. In consequence, they have not established a Royal Corps of Aeronautical Designers.

(h) All repair work, the importance of which in connection with design has been stressed above, is done in Government establishments, i.e., in Ordnance Factories, Royal Dockyards and Royal Aircraft Stations.

96. In the light of these facts, it is now necessary to consider whether there is really adequate ground for the contention that the abolition of Private Manufacture would cause stagnation in design.

I submit, for the consideration of the Commission, that there is no adequate ground for that contention. The following points appear to support this view:

(a) The research and experimentation now done by Government Departments are overwhelmingly more important than that done by private firms, for the reason that the equipment, plant, laboratories and annual income at the disposal of the Government Departments are all much greater than private firms can possibly afford.

(b) If it were desirable, the most successful research experts, designers, etc., now attached to private firms could be moved to Government establishments when the private firms were liquidated.

(c) There is no reason to think that inventors would be any less ready to bring their inventions to Government Departments than they are to bring them to private firms. It may be that while the system of Private Manufacture exists the inventors retain the hope of securing higher remuneration from private firms than Government will give. But if there were no private firms they would, obviously, take their inventions to the Government instead. If Sir W. G. Armstrong had not been able to exploit his ships and guns in private trade, can it be seriously believed that he would not have stayed at Woolwich and made them there?

(d) If the Commission consider that the inducements to inventors at the present scale would be inadequate under a system of Government monopoly, they could recommend that the rewards given should be more generous.

(e) For the work of research, experiment and design, it is plain that centralisation has great advantages. As said above, the system of a Government Corps of Designers is already adopted by the Admiralty and, in a considerable measure, by the Army; while Mr. McKinnon Wood has laid before the Commission cogent reasons for thinking that the Air Ministry might with advantage adopt the same system. It is, indeed, obvious from the very nature of research and experimentation that the pooling of ideas is more likely to produce the best results than a system by which small groups of persons carry on their work in competition with each other, each working with smaller plant and resources than they require, all of them keeping their results secret from each other.

* House of Commons Document 32, 1934, p. 19.

† House of Commons Document No. 31, 1934, p. 20.

‡ House of Commons Document 33, 1934, p. 12.

(f) It can hardly be doubted that the Government will be quite as ready to accept from persons in its own employ, or from private inventors outside, new ideas and inventions, as they now are to purchase these ideas and inventions in the form of finished goods from a private firm. It may have been the case in pre-war days that Government methods acted as a "clog" upon development and change. But that can hardly be true to-day when so much public money is devoted to promoting progress in design. Indeed, to doubt that Government Departments will be as anxious as any private firm can be to secure improvements is to throw aspersions upon the public spirit, scientific attainments, and organising power of the distinguished men who are employed by the three Fighting Services for the express purpose of promoting progress in design.

97. *Conclusions.*—The above argument may be summarised by saying that to-day there is no difference in the methods adopted by Government Departments and by private firms for promoting progress in design, except that the Government Departments have far greater resources at their disposal and the advantages which result from the centralisation and pooling of effort. The agents of Government Departments may not have the stimulus of personal profit in quite so high a degree as some of the agents of a private firm; but it may be doubted whether this stimulus of private profit is really more powerful than the search for military advantage which must inspire all ranks of Services which, like the Army, the Navy and the Air Force to-day, are responsible for preparing for the contingency of another war in which the superiority of weapons may be decisive. It is what Sir Eustace d'Eyncourt described as the international "Derby" race among nations for the lead in armament invention which, to-day, is the true stimulus to progress in design, and I submit that, while this "Derby" race continues, the nation could rely on the public spirit and the personal interests of its servants to ensure that no true opportunity of military advantage should be lost.

War Experience in respect of the matter of Progress in Design.

98. The above conclusion is confirmed by the experience of the War of 1914-18. To support this contention I offer the following quotations:

(a) An extract from the History of the Ministry of Munitions:

"Administrative methods for ensuring good quality play an important part in the successful provision of warlike stores. The relations between research, design, production and test are so intimate that ultimate effectiveness depends upon the facilities provided for a ready co-operation between the officers concerned with each of these tasks.

"When in the summer of 1915 a ministry of supply was set up to produce the equipment for the growing armies, responsibility for design and the standards of inspection were retained by the War Department. By the end of the year, it had been found to be essential to success in fulfilling the enormous munitions programme for 1916 and 1917, that these duties should be united with that of supply. Accordingly the Ministry of Munitions became responsible for design and the standards of inspection in December, 1915. At the same time, the technical duties so transferred were concentrated in a strong military department within the Ministry in order to safeguard the interests of safety and efficiency.

"The immediate results of the transfer were to expedite decisions upon which depended the whole of the supplies for the summer campaign of 1916, and to render more elastic the system for securing changes needed to facilitate production and to make the most of the country's waning material resources. . . . The maintenance of good quality in so large an output and under stringent economic conditions was a matter of considerable difficulty.

The administrative problem of combining military and commercial knowledge in a single Department of State was not easy to solve. In spite of these difficulties the technical achievements of the new Department were remarkable. New weapons were developed with success. Existing patterns were modified with rapidity to meet the changing exigencies of the war. The general quality of the munitions supplied improved steadily, so that by the end of the war British troops could place even greater confidence than before in the safety and efficiency of their equipment."*

(b) An extract from "The Great Munition Feat," by Dewar.

"Woodwich, through its immense expert and practical knowledge of munitions of war, was expected to test and advise on all manner of new inventions, which were offered first to the War Office and Admiralty and later to the Ministry of Munitions. It had incomparable facilities for that purpose."†

(c) An extract from the Report of the McKinnon Wood Committee, presented to His Majesty's Government in March, 1919.

" . . . It will still be vitally necessary for the Government to continue to carry out experiments with new forms of weapons and new developments in the material for war, introduced by scientific research, and therefore a Factory or Factories, either owned by the Government or Private trade, will be required for this purpose. We consider that the arguments in favour of the retention of a Government Arsenal in peace time are overwhelming It is of value that repair work should be undertaken in the Factory that is most closely in touch with design This can best be effected by both the main Design office and Factory being under Government control.‡

The McKinnon Wood Committee went on to say:—

"In all probability . . . private Design will largely decrease in future as armament manufacture ceases to be a subject of commercial production."§

This prospect did not alarm the McKinnon Wood Committee and they made no recommendations for encouraging or maintaining private Design, research or experimentation.

(d) An extract from the History of the Ministry of Munitions.

Discussing the necessity for the maintenance of a Government Arsenal, the History says:—

"Some such establishment seems essential as a source of the specialised knowledge of manufacture required for Government inspection and control and as a headquarters for the improvement of Design."||

The Value of Secrecy in Progress in Design.

98A. The argument set forth above provides, in some measure at least, an answer to the contention that Private Manufacture is essential to that progress in design on which, as it is said, national security depends.

But, it does not provide the whole answer. There is another aspect of increasing importance.

In setting forth the arguments in favour of a Government Arsenal, the McKinnon Wood Committee, in the report cited above, says as follows:

"In the first place secrecy, which is often a great essential in armament development, can more easily be preserved in a Government establishment."¶

* History of the Ministry of Munitions. Vol. IX Part II, pp. 106-7.

† Dewar, The Great Munition Feat. pp. 59-60.

‡ Cmd. 229, 1919, p. 8.

§ Ibid. p. 12.

|| History of Ministry of Munitions. Vol. VIII, p. 1.

¶ Cmd. 229, 1919, p. 8.

The History of the Ministry of Munitions uses almost the same language: "Secrecy," it says, "which is often essential in armament development is more easily attained in a Government Factory."

99a. These judgments result from the experience which many Governments have had of the working of the present system, under which new armament developments produced in one country are at once made available to the world at large.

It has sometimes even happened that private manufacturers have stolen new ideas or inventions developed in Government Arsenals, or Research Stations, and have sold them abroad. It has more frequently happened that private manufacturers, in the ordinary course of their business, have sold ideas and patents to other countries which their Governments and their peoples believed to be a national secret.

A remarkable example of the working of the present system is furnished by the sale of British Aircraft to Germany in 1934. Mr. McKinnon Wood has pointed out that, as the result of this sale, the German Government, whose competition is now forcing His Majesty's Government greatly to increase the British Air Force, obtained the benefits of prolonged research and experimentation carried out by a British Government Department at a very heavy expenditure of public money.

Another example, no less important from the present point of view, is furnished by the patenting in foreign countries of the Hadfield "Relieved Base" armour-piercing shell, referred to in paragraph 85 above.

CHAPTER XI

The Alleged Advantages of Foreign Trade in Arms

100. The next important argument in favour of the present system is based upon the alleged advantages of an export trade in arms.

Language is sometimes used by those in authority which would lead to the conclusion that it should be an important object of national policy to increase our export trade in arms, and it has been admitted that diplomatic missions abroad receive instructions to assist the agents of arms manufacturers in their efforts to accomplish this end.

The value of Great Britain's exports of arms.

101. It will be useful to preface the discussion of this point by a statement of Great Britain's present export trade in arms. It is set forth in the following tables:

Conclusions.

99. I submit, therefore, the following conclusions:

(a) There is no peculiar merit in the system of Private Manufacture which secures progress in design which Government Departments could not secure if Private Manufacture were brought to an end.

(b) Government Departments have greater resources, larger staffs and better equipment for research and experiment than private firms.

(c) They have an even keener stimulus to keep ahead of foreign rivals.

(d) Under Government monopoly new armament secrets would not be broadcast to the world, unless the Government decided that it was to their advantage that foreign countries should have them too. Thus, under conditions of international anarchy and armament competition, the Government would not lose, as it so often loses now, the differential military advantage which new inventions give.

(e) These advantages of Government monopoly are even greater in time of war than in time of peace.

(f) When international anarchy has been replaced by a stable system of disarmament and organised peace, the abolition of Private Manufacture would remove a factor likely to upset the balance of armed strength established by the Disarmament Treaty. For while under the Treaty, Governments would have every interest to safeguard the balance of strength established and to prevent new qualitative improvements calculated to render valueless the quantitative limitations which the Treaty laid down, private manufacturers would have an interest to circumvent or defeat the purpose of the Treaty in every way.

* Annual Report of the Director of Civil Aviation, 1933.

101A. On the above tables the following observations must be made:—

(a) The total average export of armaments in the period up to 1933 was approximately £6,000,000 per annum. The considerable expansion of world armaments since 1933 has probably increased this total; but the increase of exports is almost certainly not out of proportion to the increase of armaments manufactured for the home Government.

(b) The total of £6,000,000 includes the exports of civil aircraft. I have been unable to secure exact figures, but it appears improbable that the proportion of civil aircraft exported is more than one-twelfth of the military exports.

(c) The rough average of £6,000,000 may be considerably increased if armament firms receive orders for the larger types of warship. As the table shows, this is an occasional, but not a frequent, event.

(d) The total arms exported amount to approximately one-fifth to one-sixth of the total arms produced in Great Britain.

(e) Of the total arms exported, approximately one-third go to British dominions and possessions abroad, i.e. the value of the total exports of arms to non-British destinations may be taken as approximately £4,000,000 per annum, or one-eighth to one-ninth of the national production.

The alleged advantages of arms exports.

102. It is said:—

(a) That the export of arms gives employment to British workers and thus helps to pay for the large imports of food and raw materials without which the nation cannot live.

(b) That by spreading the overhead charges of arms-producing plant over a larger output than there would be if there were no export trade,

exports reduce the prices which the purchasers of arms—i.e. the British Government and foreign Governments—must pay.

(c) That by employing plant in arms production in peace time, it adds to the reserve of manufacturing capacity available for armament expansion if war occurs.

(d) That if war occurs, the Government can requisition the arms being manufactured for export, and thus increase its potential reserve supplies.

103. Before these advantages are examined it is necessary to consider an implicit assumption on which they are based.

It is assumed that if Private Manufacture were abolished, Great Britain would lose the whole of her present export trade in arms. This assumption rests on no foundation of experience or reason. On the contrary:—

(a) It is certain that the Overseas Governments of the British Commonwealth would continue to purchase their arms from national arsenals in Great Britain. Thus the maximum loss of export trade would amount to two-thirds of the present total, i.e. approximately £4,000,000 per annum. This is about 1 per cent. of Great Britain's manufactured exports of all kinds.

(b) As will be argued later, there is no reason for thinking that, if a National Arms Board of the kind proposed were in fact established, foreign governments would cease all their purchases of British arms. It may well be argued that such governments would prefer to deal with the agents of a non-profit-making public body rather than with the agents of private firms. If there were any purchases by foreign governments, the percentage of export trade lost would be even lower.

I now proceed to examine in turn the four alleged advantages of this export trade in arms.

104. *The employment given by the export trade in arms.*—It is true that the export of arms furnishes employment to a considerable number of British workers. But it is not true that if the exports of arms ceased, the workers who made them would remain permanently unemployed. The economic effects would be as follows:—

(a) In the long run, there would probably be equivalent employment in other exports, or in making other goods for home consumption.

(b) In the period of transition employment would be reduced; but relatively to the total unemployment at present existing, the reduction would be trivial.

(c) If the transition were made in a period of expanding trade, the reduction would be nil.

(d) If the arms exported are used in war, their effect in reducing the potential market for other British exports may outweigh their own value.

105. It must be added that if Great Britain gave the example of abolishing Private Manufacture, the political effect might be such as materially to improve the chances of securing international agreement for Disarmament. The ultimate economic effects of this would be beneficial and most important, and this hope must be counted as a real, though, of course, a purely hypothetical, offset against the immediate economic loss, if any.

106. *The "spreading" of "overhead charges."*—In most statements of the argument that the system of Private Manufacture spreads the "overhead charges" on the manufacture of arms and thus reduces prices, there is considerable confusion of thought.

(a) The reduction of overhead charges on any given product depends on two things:

(i) How nearly the factory or other unit of production approximates to the optimum size of a productive unit in a given industry.

(ii) Whether the units engaged in production are working up to full capacity or not.

(b) The analysis given above may be recalled. If the Government desires to keep a permanent reserve of plant standing idle, it must pay for it, whether the plant is in Government or private factories. But in addition there may be in private factories plant which is sometimes used for making armaments for the home Government and sometimes in making armaments for export. If this gives the plant more continuous employment, a real economy results. But it must be noted that, if Private Manufacture were abolished, Government factories might be able to manufacture for export (cf. paragraphs 174 and 175 below).

(c) Further, it must be remembered that overheads will not only be reduced if a firm undertakes the manufacture of arms; they will also be increased by the cost of the specialised selling organisation which the armament trade requires. The foreign purchasers will presumably as a rule pay for this in the prices they give for the arms they buy; but perhaps not always. In any case, the Commission will recall that in 1915 the larger armament firms laid great emphasis on their heavy expenses in this respect.

It is thus fair to conclude that the advantage due to the "spreading" of "overheads" under Private Manufacture is at best very slight, and in all probability amounts to nothing at all.

107. *The alleged increase of reserve capacity for armament expansion in time of war.*—It is evidently true that if engineering plant is engaged in making arms for export when war begins, the immediate increase of arms-production will be *pro tanto* greater than if no export trade existed. But, as shown above, the total volume of export is relatively small. The additional plant due to exports which will be available at a time of crisis will be the plant needed to make £4,000,000 worth of armaments a year. This is equivalent to a daily

output of approximately £10,950 worth of arms. In the last war consumption was at the rate of hundreds of thousands of pounds worth per day.

Moreover, as I will endeavour to show in a later section, the output of government factories can be more rapidly expanded at a time of crisis than that of private factories. It would therefore certainly not disadvantage the nation from the military point of view to keep in Government factories an additional amount of plant equivalent to that now used for the export trade. The cost of maintenance of the plant required for an output of £4,000,000 per annum would be extremely small.

108. *The requisition of war material on order for foreign Powers when war breaks out.*—It is, of course, true that if war breaks out, the Government of an arms-producing country can requisition for its own requirements the arms and ammunition being manufactured for foreign purchasers. In 1914 Great Britain requisitioned four "Dreadnoughts," other smaller ships of war, and a certain quantity of small arms and ammunition.

The following points should, however, be noticed:

(a) The amount available in the early stages of the war will not be the whole annual output of arms for export, but only a part of that output. How large a part it will be will depend on the "period of production" of the various arms which are requisitioned. It will in any case be a small amount relatively to war needs.

(b) The diminution of potential reserve stocks, due to the loss of the power to requisition arms on order for export, could therefore be remedied by a very small annual expenditure, the cost of which would probably be offset by the economies resulting from the abolition of Private Manufacture.

(c) In practice, the military advantage of the policy of requisition may be offset by important disadvantages. For since, in the Prime Minister's words, "the Covenant is the sheet anchor of British foreign policy," Great Britain will never be an aggressor in any future war and will, therefore, only engage in large-scale hostilities when she does so in co-operation with the other Members of the League in defence of the Covenant. In this case the requisitioning of arms ordered for foreign powers might mean keeping back supplies for ultimate use by British troops which require a long training before they can use them, instead of furnishing the said arms to allied troops who could use them at once.

(d) The requisitioning of arms may create political complications of a serious kind. Thus, the taking over in 1914 of two "Dreadnoughts" which were destined for the Turkish Government undoubtedly created great resentment in the Turkish Empire, and some good judges hold the view that it was a most important factor in determining Turkey's decision to take part in the war on the side of the Central Empires.

Conclusions.

109. As the result of the above discussion, I submit the following conclusions for the consideration of the Commission:

(a) That the loss of employment due to the cessation or diminution of the export trade in arms would be less serious than is often believed.

(b) That the advantage accruing from the "spreading" of "overheads" under Private Manufacture over exports of arms is relatively very small.

(c) That the addition of reserve manufacturing capacity due to the export trade is negligible in comparison with war requirements; and that the loss of such reserve capacity, if any, could easily be made good by additions to the existing plant in government factories at a very low cost to the nation.

(d) That the military advantages of requisitioning arms on order for export may be offset by important military and political disadvantages.

CHAPTER XII

Private Manufacture and the Expansion of Armament Production in Time of War

110. Of all the arguments deduced in favour of the system of Private Manufacture, the most important is that which relates to the expansion of armament production in time of war. It was this argument which inspired a recent official statement to the effect that to abolish the private firms would be to "strike a vital blow to our own real security."

111. This view has been shared by many Governments and has led them to accept anomalies which, otherwise, it is most improbable that they would have approved. Two examples may be given:

(a) In the Proceedings before Senator Nye's Senatorial Commission of Inquiry, a letter was read addressed on 8th May, 1923 to Mr. L. L. Driggs, the President of the Driggs Ordnance and Engineering Company of New York, by the Assistant Secretary for War in the United States Government. The letter reads as follows:

"It is the desire of the War Department to encourage the manufacture of munitions in the United States by commercial manufacturers. The War Department would be willing to release to your company the designs of our latest anti-aircraft material, with the exception of certain secret portions, provided you had a contract with a foreign Government for a production quantity of anti-aircraft material which you would agree to manufacture in the United States. You can readily appreciate that an order from a foreign source for only two or three of these new 'anti-aircraft materials' would only serve to disclose to the foreign power the latest United States developments in anti-aircraft artillery, and would not develop any munitions manufacturing capacity in your plant. The size of the order will, therefore, have to receive the approval of the War Department before any design information is released to your company.*"

This letter shows that the War Department of a Great Power was so anxious to increase the "munition manufacturing capacity" of a private firm that it was prepared to "disclose to a foreign Power the latest United States developments (i.e., secret Government developments) in anti-aircraft artillery," provided it was satisfied that the foreign Power (N.B.—any foreign Power) would avail itself of these developments in large amounts.

(b) An extract from a Memorandum on the Air Estimates contained in the British Air Ministry's "Appropriation Account," 1932, reads as follows:

"The Council regard it . . . as a matter for satisfaction that Great Britain has of recent years, as a result of the close partnership between the Air Ministry and the industry, led the world both in performance and in development of the new technique. This is reflected in the growing volume of foreign orders with the advantageous reaction on domestic prices indicated in paragraph 9 above."

This is equivalent to saying that the potential enemies of Great Britain are receiving the benefit of all the technical improvements which have given us the lead in military aviation and which are due in great part to the Air Ministry's research.

Nor are the Air Ministry content merely to give "the industry" the benefit of their research; they also assist them in securing foreign orders. The Chairman of Hawker Aircraft, Ltd., Mr. Sopwith, spoke to the Annual General Meeting of his shareholders on 2nd July, 1935, as follows:

"A strong measure of support has been received from the Air Ministry and the Department of Overseas Trade in all our foreign business, and we shall spare no effort further to build up this side of our activities."

Thus the Air Ministry, like the War Department of the United States, are willing to give the benefit of their technical improvements to potential enemies provided, in return, there is in their own country an increased manufacturing capacity which will enable them to expand the output of armaments in time of war.

112. In this chapter of my statement of evidence I desire to examine in the light of pre-war and war experience this officially accepted doctrine that the possession of a private armament industry enables a country to expand its armament production more rapidly than it could expand it if the manufacture of arms were a Government monopoly.

At first sight the argument in favour of this doctrine appears persuasive. Armament production, in many of its processes, requires specialised machinery, specially trained workers and specially expert managerial skill. The mechanism of most arms and most kinds of munitions is highly complex and a high standard of precision is required; it seems obvious, therefore, that a system which increases the number of factories where armament manufacture is understood and where there are the necessary machinery and trained personnel *must* also increase the power of the country to expand production in time of war. The more widely peacetime production is "spread," the more numerous the units which understand the work and which could, therefore, be switched over to arms production when war begins, the more, it would seem, the total potential increase is bound to be.

113. In reality, however, this simple statement of the matter begs the question.

The amount of specialised armament plant in any given country will consist of:

(a) the amount required to produce the annual output of armaments for consumption at home and for export abroad;

(b) the unused reserve plant for the maintenance of which in idleness the Government elects to pay.

As I have shown above, this amount will be the same whether the plant is situated in Government arsenals or in private factories. In the case of Great Britain, the only addition due to the system of Private Manufacture which might be lost if that system were abolished, is the small amount of specialised plant required to make the arms which Great Britain at present exports, and which she might cease to export under a system of Government monopoly.

It follows that the problem as to whether or not the possession of a private armament industry will increase the power to expand armament production in time of need, reduces itself to three simple questions:

(a) Will a Government arsenal, with a given amount of plant, specialised machinery, special labour and special managerial skill, expand less rapidly than a private armament factory with the same amount of plant, specialised machinery, etc.?

(b) Is a private firm better adapted than a Government arsenal for mobilising and bringing into production the general engineering resources of the country? Is it better equipped for instructing the ordinary non-armament firms how to carry out the manufacturing processes required; for furnishing them with the drawings, jigs, gauges, etc., which they will need; and for distributing, co-ordinating and assembling the many various products of their work?

(c) Is a private firm better adapted than Government Departments for building the new factories and installing the new plant required to produce those kinds of war material for the production of which all the existing Government and private manufacturing resources of the country are inadequate?

* Hearings before the Special Committee investigating the Munitions Industry, United States Senate, Part 2, Exhibit No. 206, p. 530.

I will attempt to answer these questions in the light of British experience before and during the War. For this purpose I will base the discussion on the assumption—on which all my evidence is based—that in order to meet the needs of the nation in future war it would be necessary both to expand Government arsenals to their maximum capacity, and to bring into armament production the whole of private industry that is capable of making the necessary adaptations in its plant.

Comparative Expansion of Government Factories and Private Armament Firms.

114. Are there grounds for thinking that a private armament factory with a given amount of plant, etc., will expand its production in time of crisis more rapidly than a Government arsenal with an equal amount of plant?

I submit to the Commission that the answer to this question is as follows:

(a) There is an *a priori* case for believing that Government arsenals will be able to expand more quickly than a private armament firm. Indeed, they obviously have certain natural advantages. Thus:

(i) It is easier for Government arsenals than for private firms to prevent their men from enlisting in the armed forces.

(ii) Since the work of Government arsenals is more highly specialised than that of private firms, the general level of skill, both among workers and managerial staff, tends to be higher. "Dilution" of labour can, therefore, be carried further.

(iii) Since there is no question of private profit, the workers can be asked to make greater efforts, and arrangements for longer hours, etc., can thus more easily and more rapidly be made.

(b) A Government Committee which examined the armament industry and the Government Factories and Workshops under the Chairmanship of Sir G. H. Murray in 1907, declared as follows: "Their (the Ordnance Factories) primary function is to provide a reserve of production power capable of being utilised to the full in times of emergency. It is admitted on all hands that the ultimate productive power of the private industry of this country is greater than that which is possessed by the Government establishments; but the trade takes time to adapt itself to an increased demand and the arsenal must be adequately equipped for tiding over the first few months of a critical period."

They therefore recommended a plan which, in their view, would enable the arsenal "to increase its output without loss of efficiency to the greatest possible extent in the shortest possible time."

In other words, the Murray Committee believed that, under the organisation which they proposed, and which, in fact, was adopted, Government arsenals could expand more rapidly than private firms.

(c) But according to the evidence given by General Martel to the McKinnon Wood Committee in 1919, the man-power of Woolwich Arsenal had been reduced before 1914 below the level at which maximum expansion was possible. General Martel declared, indeed, that the number of skilled men was on the low side; that the shop staff was so low that it was barely possible to carry on, even in peace time; that this was a serious handicap when rapid expansion was needed; that the Ordnance factories were left with machinery to meet a moderate expansion but not more.

General Martel gave evidence that the total number of men in the Ordnance Factories had been reduced to approximately 10,500, although the Chief Inspector of Ordnance Factories had declared that 14,600 was the minimum required for efficiency.

In other words, the Ordnance Factories were less well prepared in 1914 for rapid expansion than the Murray Committee had believed they would be.

(d) Nevertheless, so far as it is possible to make any comparison, there are grounds for thinking that the Government establishments expanded at least as rapidly and as much as private firms during the War.

As the History of the Ministry of Munitions makes plain, no statistics were obtained until 1918 as to the numbers of workers engaged on different classes of armament work, nor was there any exact computation either of the total number of armament workers or of the separate categories of armament workers engaged on the production of war material before the War. But the following figures may perhaps serve to give a rough indication of the comparative expansions that took place:

Total employed in Private Firms:

August, 1914 (estimate made by Ministry of Munitions)	50,000
13th April, 1915 (total employed by 12 principal armament firms)	62,924

Total employed in Ordnance Factories:

August, 1914	10,500 (approx.)
13th April, 1915	36,393

Woolwich Arsenal:

	<i>Total Employed.</i>
June, 1914	8,500
31st December, 1914	23,000

The figures of expansion in certain specialised departments of Woolwich Arsenal may be compared with the expansion effected by two comparable private firms.

Woolwich Arsenal—Filling Factories:

	<i>Total Employed.</i>
1st August, 1914	1,580
31st December, 1915	11,000

Woolwich Arsenal—Small Arms

Munition Factories:

1st August, 1914	666
5th October, 1918*	8,027

Birmingham Small Arms Company:

August, 1914	3,500
November, 1918*	13,000

Kynochs:

1914	3,410
1915	10,798

I do not suggest that these figures can be used to justify any definite conclusion; but if I think they suffice to show that there is at least no proved case for the view that in the last war private manufacturers effected a greater expansion than the Government arsenals on an equivalent basis of plant and personnel.

(e) The judgments of those in charge of munitions production during the War lend at least some support to the view that the Government arsenals expanded more rapidly than private firms. Mr. Lloyd George's declarations concerning the success of Woolwich Arsenal are well known. Speaking of Woolwich Arsenal a well-known authority, Mr. Dewar, says:

"We could not have won the war except for its resources and ingenuity in the earlier part of the struggle."

Many other such judgments could be cited.

Bringing non-specialised industry into armament production.

115. I now turn to the second question set forth in para. 113 above: whether private firms are better adapted than Government factories or arsenals for bringing into armament production the non-specialised engineering resources of the country. To put this question in the language of to-day: should the private armament firms be entrusted with the industrial mobilisation of the nation for the production of arms and ammunition in case of war?

On this question the experience of the last war furnished evidence of the utmost importance.

* No earlier figure available.

116. For at the beginning of the war the task of industrial mobilisation was left in the hands of the private armament firms. This was the result of a deliberate policy adopted on the recommendation of the Murray Committee referred to above. The governing passage of the Murray Committee's Report is as follows:

"It is admitted on all hands that the ultimate productive power of the private industry of this country is greater than that which is possessed by the Government establishments. *But the trade takes time to adapt itself to an increased demand, and the Arsenal must be adequately equipped for tiding over the first few months of a critical period. After that period, all important as it is in war, private enterprise may be trusted to meet the national requirements to a large extent.*"

117. No effort was spared to give an honest trial to this plan of making the established armament firms the agents for developing the arms-producing resources of the country. Thus before war broke out:

(a) The share of orders given to the armament firms was greatly increased. It was a consequence of this that, although armament expenditure rose from £59,000,000 in 1907 to £77,000,000 in 1914 the man-power of the ordnance factories was reduced by nearly 40 per cent.

(b) The armament firms were given special assistance, including subsidies to enable them to increase their plant.

(c) The Government established very close relations of co-operation and consultation with the armament firms.

118. Nor did this special treatment and encouragement end when war began. On the contrary:

(a) Orders for arms and munitions were given exclusively to the established armament firms on the Admiralty and War Office lists.

All other firms who offered to help were instructed to apply to the armament firms for sub-contracts.

(b) The armament firms were allowed to make sub-contracts free from inquiry, supervision or review by the Government.

(c) They were given special privileges with regard to the recruitment of skilled labour. The Labour Exchange organisation was even made "to go beyond its normal functions and attempt to persuade employers to surrender their skilled men to the armament firms." (Hist. of Ministry of Munitions.)

(d) The technique of armament manufacture was kept a close secret of the armament firms; for this purpose even Government factories were closed to enterprising engineers who wanted to find out if their plant could not be used for munition production. This secrecy was first impaired when Lord Kitchener threw open Woolwich Arsenal in April, 1915.

(e) The armament firms were given almost any price they asked for, in the belief that higher prices would induce greater output. The History of the Ministry of Munitions says that many of the prices paid were "fantastic."

(f) The plan adopted was not abandoned after a brief or unfair trial. On the contrary, it was adhered to from August, 1914, until May, 1915, in spite of many demands from Government Departments, spokesmen of the engineering industry and public opinion that a new system should be tried.

119. Yet in spite of these great efforts to make it succeed, the plan of using the private armament firms to adapt the engineering resources of the country for war-production was a total failure. Dr. Addison has furnished the Commission with such a full account of this failure, and with so many detailed figures demonstrating its extent, that it is unnecessary for me to dwell on it. I only offer as further evidence some additional contemporary judgments.

(a) Lord Kitchener, Secretary of State for War, in the House of Lords on 15th March, 1915:—

"The output" (of arms and munitions) "is not only not equal to our necessities, but does not fulfil our expectations, for a very large number of our orders have not been completed by the dates on which they were promised."

(b) Mr. Bonar Law, in the House of Commons a week earlier:—

"I do think that we have not mobilised the industries of the country in the way in which it was possible to mobilise them for the purposes of the war."

(c) The "Times" on 6th April, 1915:—

"It is certain that the national resources have not been utilized to the full. Indeed, no attempt has been made to do so."

(d) Mr. Lloyd George, the first Minister of Munitions, in June, 1915:—

"To be quite candid, the armament firms were inadequate to the gigantic task cast upon them not merely of organising their own work, but of developing the resources of the country outside."

(e) I also offer the mature judgment of an impartial author who has written an important study of the production of munitions during the war, Mr. Dewar:—

"During the first 10 months of the war we were struggling to get sufficient munitions despite the fact that neither Labour nor Capital, neither employer nor employed, was organised on a great national basis. . . .

"The more one looks into that organisation (the Ministry of Munitions) in detail and surveys it as a whole, comparing it with the *vector of the first 10 months of effort, the stronger becomes the conviction that the munition feat could not have been carried out on the old lines. . . . Those who expected the War Office to deliver the goods working under the old system, and in the midst of the labour and industrial chaos of 1914-15, expected a miracle in munitions.*" ("The Great Munition Feat.")

120. The failure of the armament firms has brought upon them a great deal of censure for their rapacity and lack of public spirit. It is usually forgotten that there is a good deal to be said in their defence. Thus:—

(a) Before 1914 they had concentrated principally on Admiralty work, for the reason that it was primarily Admiralty orders which they received. The Navy did not require, and had never expected to require, such an immensely increased output of guns and ammunition as that which was required for the Army.

(b) Not even the War Office itself had foreseen how immeasurably requirements of guns and ammunition would be increased. They had given the private firms no warning to prepare for such expansion as in fact was needed.

(c) Undoubtedly the private firms accepted orders far beyond their power to fulfil. But in August and September, 1914, when their contracts were made, it was exceedingly difficult for them to foresee what expansion they might be able to effect under the stimulus of war.

(d) By the end of the war in 1918 they had succeeded in making an immense contribution to the total armament with which the British forces were supplied.

121. But these mitigating considerations do not affect the fact that under the system in force the Government relied upon the private armament firms to fulfil their promises; that in consequence it failed itself to take the steps required to increase the output of arms; and that when the promises of the manufacturers were not fulfilled, disaster inevitably followed in the field.

This disaster was not confined to the British armies, for Mr. Lloyd George has shown that the private armament firms also

accepted "orders on a gigantic scale from the Russian Government." Mr. Lloyd George goes on to say:

"When they accepted these Russian contracts they must have known that they had not the faintest chance of executing them in time if they were to deal fairly with their British orders. Their failure to execute these orders was largely responsible for the disasters which befell the Russians in the campaign of 1914-15."

122. The truth is that in so far as mitigating circumstances may provide excuses for the individual firms concerned, they only furnish further condemnation of the general system by which the national fate was made dependent on the efforts of a small number of private undertakings.

The causes of the failure of the private firms.

123. The following are the principal causes of the failure of the private armament firms as agents for industrial mobilisation.

124. *Their internal organisation.*—There seems to be no doubt that, owing, perhaps, to the privileged position which they had held before 1914, and to the exceedingly high profits which they were able to earn,* the armament firms had allowed their internal organisation to fall below the highest standards of industrial administration.

125. *The sub-contracting system.*—There is evidence both from the two Ministers of Munitions, and from many representatives of the engineering industry, that the system of "sub-contracting" was a total failure. The main reasons for this failure were as follows:

(a) As a rule, the armament firms did not pass on to sub-contractors any substantial proportion of the high profits they were making. On the contrary, "it was at least a common complaint that . . . the contracts that were sub-let . . . were given on terms that left a very moderate margin of profit." (Hist. of M.M.) Or, as one representative of the engineering industry reported to the Ministry of Munitions, "the large armament firms are taking the last drop of financial blood from these small contractors."

(b) This fact increased what was perhaps the natural antipathy of the sub-contractor for the direct contractor. But apart from this financial consideration, there is general evidence that manufacturers desired on patriotic grounds to work directly for the State, and resented the intervention of the armament firms.

(c) The natural reluctance of the armament firms to teach sub-contractors the technique of armament production. The records show that during the early stages of the War the armament firms were constantly preoccupied with the danger that they might be creating new competitors in the armament market who would continue production when the War was over.

(d) The armament firms were not only making sub-contracts; they were simultaneously trying to extend their own factories. To do this they had to attract skilled labour from the other engineering firms in their own regions, i.e., from the firms to whom they tried to let sub-contracts. Their efforts in this direction were strongly resented by the other firms. This was a further obstacle to the smooth co-operation upon which successful sub-contracting must depend.

(e) Still more important was the inability of the private firms to furnish the instruction and assistance which the sub-contractors needed.

For the most part, the work given to sub-contractors in the early part of the War was not difficult. If they had received adequate drawings, specifications, jigs and gauges, with one or two skilled workers to supervise their work, they could

have put their factories into production without undue delay. But the armament firms could spare no skilled workmen; they had no drawings, jigs, etc., ready; and they could not provide the necessary experts to make them. In consequence sub-contractors had to work out their own methods of production, which often involved a delay of many months.

For this failure the armament firms were not to blame, for they could not be expected to prepare drawings, jigs, etc., in time of peace. But for that very reason this was a most serious inherent weakness of the system of sub-contracting, i.e., of relying upon private firms to mobilise the general engineering resources of the country for war production.

126. Sub-contracting was the method by which it had been intended that the private firms should mobilise the potential resources of the country; and when it failed, there was no hope that the private armament firms could produce adequate results by other methods. But apart from the failure of sub-contracting, the whole conception of relying on a limited number of private firms was proved to be inadequate and wrong.

Although Dr. Addison has dealt with them at length, it may perhaps be useful for me to summarise again the main reasons why this was true.

127. *Labour.*—Dependence on the armament firms made it impossible to use to maximum advantage the skilled, semi-skilled and unskilled labour resources of the nation. This was because:

(a) A census of available labour of various kinds was required.

(b) It was necessary to curb the patriotism of skilled workers who desired to enlist in the armed forces.

(c) The transference of labour from one trade to another, from one firm to another, and from the armed forces back to industry was necessary.

(d) It was necessary to negotiate with the Trade Unions for the "dilution" of labour, i.e., for the relaxation of rules to which the Trade Union movement attached the highest importance as social safeguards.

All these functions could only be performed by Government. It was obviously impossible for private firms to perform them.

128. Not only so, but the system of reliance on the private armament firms increased the great inherent difficulties of these tasks in various ways:

(a) The factor of private profit was a most serious disadvantage. It increased the reluctance of other employers to agree to labour transference to the armament firms. It greatly increased the reluctance of the Trade Unions to abandon or mitigate their protective regulations. Lord Kitchener and the History of the Ministry of Munitions give decisive evidence that the establishment of national factories "led the way in dilution" for the reason that "there could be no suggestion of profit being made except for the nation."

(b) The competition of the private armament firms for skilled labour reduced the whole labour market to chaos.

129. *Raw Materials.*—Dr. Addison has similarly given evidence to show that:

(a) The competition of private manufacturers for raw materials vastly inflated prices, and thus prevented the most economic use of such supplies as were available. For this reason adequate armament production was impossible until the Government had monopolised raw material supplies and placed them under a scheme of national organisation and distribution.

(b) In respect of many essential raw materials the total available peace-time supplies were wholly inadequate for war needs. The additional quantities required could only be adequately produced in national factories and on a non-profit-making basis.

* The Commission will recall Dr. Addison's evidence that Mr. Jack of Hadfield's declared to the Ministry of Munitions that "the War Office in peace time had given Hadfield's millions of pounds worth of orders at 25 per cent. profit, which meant really 33 per cent. profit." (Minutes of Evidence, 4th and 6th Days, Appendix, p. 122.)

130. Machine Tools.—In respect of machine tools, as in respect of labour and raw materials, two problems arose:

(a) Securing the best use of available supplies.
(b) Increasing supplies where they were insufficient.

(a) While the private firms were in charge there were only two plans which could be adopted for using the available supplies:

(i) Using the machine tools in the factories where they were already situated, i.e. sub-contracting, which proved a failure.

(ii) Moving machine tools from factories where they were not being used to most advantage to the new factories which the armament firms were building. This created the utmost possible friction; and it was in fact impossible to secure any effective redistribution of machine tools until the Government had taken charge and a national census had been made.

(b) There was no means of ensuring the increased supply of machine tools* and the most advantageous allocation of the current products of the machine tool trade, except by government control.

Thus in respect of machine tools also, the system of reliance on the private firms inevitably failed.

131. Sub-division of industrial processes.—The immense increase in the scale of armament production showed another inherent weakness in the system of reliance on the private armament firms. In his War Memoirs, Mr. Lloyd George says:

"In place of the War Office method of contracting with a few experienced firms for supplies of finished articles, a method which had worked satisfactorily in peace time but had proved quite inadequate to this war, the Ministry of Munitions had to concern itself directly with the production of every raw material and intermediate stage of manufacture of each component in its munitions supplies."

It soon became evident that great economies could be made by the sub-division of manufacturing processes and the distribution of production of different components over a larger number of different factories.

This plan had the following advantages:—

"The effects of State Control of the munitions industry soon became visible in the introduction of economies in labour and material through the spread of mass production, in increased standardisation, and increased sub-division of manufacturing processes, which allowed the employment of automatic machinery and of unskilled labour, and in the pooling of manufacturing skill and experience." (Hist. of M.M.)

This highly developed sub-division of manufacturing processes was obviously too large-scale an operation to be handled successfully by the private armament firms.

132. Co-ordination of Production.—Nor were the private firms capable of creating the centralised authority required to conduct the co-ordinated assembly and inspection which was required before war material could be delivered to the Government.

The advantages in this respect of a system of Government monopoly have been well stated by M. Pierre Cot, who writes as a member of a French Cabinet which made a special study of the subject. He says:—

"To be able to assure their war production in case of need all States plan their industrial mobilisation in advance. Everywhere, secretly or openly, plans are drawn up by the General Staffs. I cannot imagine a single General Staff that would ignore this capital problem. These plans are more or less complete. They rest on an inventory of the economic and industrial resources of the country. A chart of the 'war potential' is constructed. It is on the basis of this potential that

the plans of industrial mobilisation are framed. Groups, or 'families', of factories are constituted. These groups in time of war will work together. One factory will provide the raw material, another the half-finished products; another will proceed to the assembly of parts and construction. These groups radiate round a central factory which is the real *matrix* and which, as a rule, is responsible for the assembly and construction. These *matrices* are usually represented by a factory which in peace time has worked for national defence. Let us take an example. In time of peace a particular aeroplane factory produces the entire aeroplane. In time of war it will be responsible only for the most delicate task, namely the final construction of the aeroplane and the production of a few parts; but it will receive in the form of finished products all the parts whose assembly will create the aeroplane. These parts will be produced in the factories or group of factories best qualified by their peace-time production for their construction. There is no need to pursue this demonstration further. Everyone realises how much more effectively and accurately industrial mobilisation could be planned if these factories, the master-units of the group, were State factories. That is self-evident. It is no use telling us that private industry is needed for industrial mobilisation. Such a proposition is at the same time true and false; true, in that private factories manufacturing no munitions in time of peace figure in the units in the industrial mobilisation which are formed by munition-factories and, false, in that it would be to the general interest to nationalise such factories."

133. Instruction of non-specialised engineering firms.—Under the heading "sub-contracting," I have reminded the Commission that the armament firms were neither well equipped nor always well disposed for the task of bringing outside firms rapidly into armament production. They were naturally and, from their own point of view, rightly, eager to protect trade secrets. There is much evidence that this policy of "mystery" was applied to a point at which it gravely hindered the expansion of production. In September, 1916, Sir William Weir laid a memorandum before the War Cabinet in which he said:

"Time and again the Ministry has been told that certain munitions require such high skill that only certain firms of long experience can undertake the supply, and time and again the Ministry, through the magnificent response of engineering firms of all classes, has disproved the statement." (Hist. of Ministry of Munitions.)

It was only after Lord Kitchener opened Woolwich Arsenal that "the barriers of mystery" were broken down and that "the whole resources of expert knowledge were thrown into a common stock." "The armament firms had now nothing to lose by following suit." (Hist. of Ministry of Munitions.)

This natural reluctance to create competitors was in itself a most serious objection to the plan of leaving private firms to mobilise the reserve capacity of the country.

134. But apart from this objection, war-experience showed that the task of instructing non-specialised engineering firms could be carried through much better by Government agencies.

In fact a great deal of this work was done by Woolwich Arsenal. Woolwich had been allowed to make no preparations in time of peace to perform this function. It had:

(i) "No expert staff available for training new firms";

(ii) "The inadequate and overdriven staff could not be spared to inspect the plant of potential contractors."

(iii) "No adequate stocks of manufacturing equipment existed, since the expansion of production which called for vast quantities of drawings, specifications and gauges was quite unexpected." (Hist. of Ministry of Munitions.)

* I leave out of account the purchases made from the United States, which were wholly inadequate to the national requirements, and which do not in any case affect the present argument.

Nevertheless Woolwich Arsenal was able to accomplish a great deal. Thus Mr. Dewar says:

"Of the thousands of controlled firms and sub-contractors making munitions in 1916 and 1917, the vast majority—probably something like 90-95 per cent.—had never turned out a component of gun or shell, etc., before the War. The little firms, having no machines worth mentioning, could not undertake elaborate tooling operations—'carvings in steel'—far less could they turn out a complete shell or gun. But, once they were marshalled, and their work in some degree co-ordinated, they could turn out in quantity some small munition part or component, such as pins, screws, etc., and thus render valuable service."

"It was in guiding or advising these newcomers, innocent of war and its material, that the Royal Arsenal, with its extraordinary variety of output, its experience, and its prompt advice, was so valuable."

"People not only came to Woolwich from all quarters to observe, and inquire as to some point in munition work they were doubtful about; Woolwich had distributed many of its experts throughout the country; we found in factories all over the North and elsewhere, through the war, Woolwich instructions and instructors in munition making."

135. The Chief Mechanical Engineer at Woolwich, Mr. C. H. Roberts, describing this instructional work to the McKinnon Wood Committee in 1919, was reported as follows:—

"In the spring of 1915, when the War Office Armaments Output Committee was endeavouring to get firms all over the country to take up the manufacture of shells and cartridge cases, it became a recognised procedure to send the firms' representatives—practically none of whom knew anything of the business—down to Woolwich to be instructed. This was soon found, however, to be hindering the Ordnance Factories to such a serious extent, by occupying the time of foremen and managers, that his"—Mr. Roberts—"department was asked to take on this instructional work. This was done, and Mr. Roberts also wrote a series of instructional sheets outlining the principal operations in the manufacture of each type of component, and it is believed that these were found so useful that they were printed and distributed in large numbers to firms all over the country, who were then taking up the work. Altogether about 1,500 firms, or their representatives, visited Woolwich for the above purpose, and of these, he himself saw over half, but was afterwards unable to continue doing so, as his own time was too much occupied by the great expansion in plant then being undertaken at Woolwich. He thought it was not too much to say that were it not for the assistance given by the Ordnance Factories at Woolwich during the period in question, there would have been very little prospect of any of the numerous controlled factories—now running into some thousands—producing any output for months, not to say years."—(Minutes of the Engineering Sub-Committee of the McKinnon Wood Committee, 7th meeting, 22nd October, 1918.)*

136. The claim thus made by the Chief Mechanical Engineer on behalf of Woolwich as an instructional agency was fully upheld by the findings of the McKinnon Wood Committee when the War was over. For they proposed in their Report† that all preparations for future industrial mobilisation for war production should be devolved upon the Arsenal.

Thus they say:—

"Moreover it is necessary to bear in mind the assistance which such an arsenal can render in training the personnel of new factories, when expansion is suddenly required"

"We also consider that a section of the Woolwich Drawing Office should be organised specially

for the design of jigs, gauges and special tools—a branch of design which requires special experience. The supply of the necessary drawings of these articles is the first requisite of war expansion"

"The issue of drawings to guide manufacture after sealing by the Chief Inspector should be undertaken by a special branch of the main drawing office, which should be organised and equipped for considerable expansion"

"It"—the Arsenal—"should also be capable of immediate supply of design for jigs and gauges of all current articles of armaments immediately on mobilisation of the engineering resources of the country for war, and also be in a position to send technical manufacturing advice to the firms involved."

137. I submit, therefore, that the experience of the last war showed that government factories have great advantages over private firms in the vitally important matter of instructing non-armament firms. The recommendation of the McKinnon Wood Committee on this subject must carry great weight in view of the time at which, and the circumstances in which, their Report was made.

I submit that the verdict of the McKinnon Wood Committee supports the conclusion that the greater the proportion of armament workers who are employed in government factories in peace-time, the larger will be the cadre of expert workers immediately available to mobilise industry in general if war breaks out. This is an important technical advantage of the system of Government monopoly.

The Construction of new Factories.

138. I now turn to the third question set out in paragraph 113 above, namely: Is a private firm better adapted than Government Departments for building new factories and installing new plant to produce the kinds of war material, demands for which exceed all the supplies which can possibly be obtained from the existing resources of the armament and non-armament industries of the country?

139. It was shown early in the last war that neither the maximum expansion of existing armament plant, nor the complete mobilisation of non-specialised engineering plant, would suffice to meet the nation's war requirements. The creation of additional new factories with specialised plant was thus urgently required.

140. It was also shown that, in the task of constructing such factories, the Government had great advantage as against the private firms. An illustration may be given by citing from the History of the Ministry of Munitions the account of a transaction between the War Office and a private firm in the early days of the war. The firm in question was the Norton Metal Company, Ltd. This firm desired to build and equip a complete plant capable of dealing with every stage of production of small arms ammunition. The firm

"asked for a contract for the supply of 4 million (rounds) a week from March 1915 to March 1916, or a firm order for 100 million. The terms asked were 128s. 9d. per 1,000 together with a cash advance of £65,000." (N.B. the average price of pre-war contracts was about 100s. per 1,000). "The firm asked for some assurance as to their post-war position, having especially in view the presumption that the Woolwich plant would also be greatly extended. They maintained that 'if in the past the various contractors had been subsidised, or kept going with regular orders for ammunition, the present emergency would not have occurred.' The firm was told that 'on the conclusion of the war, orders for small arms ammunition will naturally contract to the peace scale, and no undertaking as to their extent can possibly be given.'"

* Quoted from *War or Peace: The National Control of Armaments*, by Gilbert Slater, M.A., D.Sc.

† Cmd. 239, 1919, pp. 8 and 13.

"On September 8 the firm were instructed to proceed in anticipation of a contract for an additional quantity of 45,000,000, the price to be settled later . . . The order was accepted on September 21 at 12s. per 1,000, but the firm demurred to the application of the penalty clause for late delivery.

"In the event, only 9,400,000 cartridges were delivered within the specific time limit, the balance, 35,600,000 becoming liable to liquidated damages amounting to £5,150. The firm stated that among the causes of delay the excavating contractor had been two months behind time, that the plant was delivered late, that labour supply had been inadequate, and that appeals to the Government for assistance in securing toolmakers had met with little result. The claim was accordingly waived."

141. This story is only typical of very many others that could be given. It shows:—

(a) The difficulty of the Private Firm in raising the capital required and the consequent demand for an advance from the Government.

(b) The anxiety of the firm concerning the future of the new plant when the War was over—and no one had any conception how soon that might be.

(c) The delays in building the factory, owing to the failure of other contractors to fulfil their promises.

(d) The delays in the delivery of the necessary machinery.

(e) The difficulty of securing the labour, and especially the skilled labour, required.

142. Some of these were obstacles to the rapid opening of new plants which faced everyone, Government and private firms alike, during the War. But it is important to note that in respect of all of them the Government were in a far stronger position than the Private Firms. For:—

(a) If the Government desired to invest capital in national factories it had the unlimited resources of national credit on which to draw.

(b) It need fear no financial loss, since that loss would fall on the shoulders of the nation, who were more than willing to accept the risk of such loss, if so doing diminished the danger of military defeat.

(c) While the Government could only advance capital to private firms after most careful consideration and negotiation, it could do so at once for national factories.

(d) It had a far stronger hold on building contractors than any private firm could have.

(e) The Government alone could ensure delivery of the necessary machinery where it was most urgently required.

(f) The Government alone could secure the necessary skilled labour to enable a new factory to enter into production.

These great advantages are among the reasons which explain the overwhelming success of the national factories which Dr. Addison described to the Commission. They plainly give the Government great advantages over private firms in the rapid construction of the new factories and plant which are sure to be required in time of war.

Conclusions.

143. I may now perhaps summarise the general results of the above discussion of the expansion of armament production in time of war.

(a) The amount of plant, labour and managerial skill devoted to armament production in any given country in time of peace depends upon the amount of armaments which that country annually produces. It will not be greater if distributed among the factories of private firms than if it is concentrated in government factories (allowing for a possible small difference owing to export trade).

(b) There is no ground of theory or experience for holding that a given amount of plant, labour and managerial skill in a private factory will

permit a more rapid or larger expansion of production on the outbreak of war than a similar amount so engaged in government factories.

(c) There is no ground for believing that private firms are better able than Government factories to mobilise the non-specialised engineering resources of the country for war-production. On the contrary, Woolwich Arsenal, though acting under great difficulties and without preparation, fulfilled the function of an instructional agency with considerable success. The armament firms upon whom the Government had relied for this purpose completely failed. They failed for the reasons set forth above, i.e.:

(i) The failure of sub-contracting.

(ii) The chaos produced by their competition for supplies of labour.

(iii) The chaos produced by their competition for raw materials.

(iv) The chaos produced by their competition for machine tools and other equipment.

(v) The incapacity of the private firms adequately to sub-divide manufacturing processes.

(vi) The incapacity of private firms to co-ordinate production on an adequately large scale.

(d) There is no ground for believing that private firms can build the new factories required for armament production in war time more rapidly or more advantageously than the Government can build them.

144. I submit, therefore, that both theory and experience lead to the conclusion that there is no function in the expansion of armament production in time of war which cannot be at least as effectively performed by the Government as it can by private firms. I submit further that the facts set forth above give strong grounds for holding that a positive balance of advantage lies with Government establishments in all the various regards which have been discussed, and that therefore the larger the proportion of plant, man-power and managerial skill which is concentrated in Government establishments when war begins, the more rapid the expansion of production is likely to be. If this be true, then, so far as expansion of production is concerned, advantage lies with the system of Government monopoly.

The Evidence of Authority.

145. I submit that the above conclusion is strongly supported by the mature judgment of many of those most closely concerned with armament production during the War.

(a) The Commission will recall that the abandonment of reliance on the private firms, the creation of the Ministry of Munitions, and the mobilisation under national control of the engineering and other resources of the nation, were carried through with the full approval and concurrence of every party in the State. During the last three and a-half years of the War it was universally agreed that in the change which had been made lay the nation's chief hope for the avoidance of defeat.

(b) I submit that the Report of the McKinnon Wood Committee further supports this view.

146. I venture to recall to the Commission the Terms of Reference and the composition of this Committee. Their Terms of Reference were as follows:

"To enquire into, and report upon the control, administration, organisation, lay-out, and equipment of the Royal Ordnance Factories at Woolwich, and the nature and distribution of the work carried on in them and at the Arsenal generally, and to advise the Minister of Munitions what, if any, changes are required.

"The Committee to have due regard to the importance of efficient and economic production, and the necessity for maintaining a reserve of productive power, and to give due weight to the obligations of the Government, as an Employer, to ensure the best possible industrial and housing conditions for the Employees."

147. The McKinnon Wood Committee was presided over by an ex-member of the Cabinet, the Rt. Hon. T. McKinnon Wood, M.P. Its members included representatives of the War Office, Admiralty and other Departments. Two of them—Admiral Sir R. H. S. Bacon and Mr. H. Monsforth—had earlier been Directors of private armament firms; Admiral Bacon had also held a responsible post in the Government administration during the War; while Mr. Brindley had been Manager of the Ponders End Shell Factory. Most of the others had had first-hand experience of at least some aspects of munition problems during the War.

148. During the seven months from August 1918 to March 1919 the Committee took evidence from many of those who had the highest posts of responsibility in connection with the production of armaments during the War. They thus had greater collective experience of the problem of munition production than any other body of people who have ever considered the matter. They made their report in the light of the extended and convincing trial of the plan recommended by the Murray Committee, and of the system of national control which replaced it.

149. It is true that their Terms of Reference restricted them to the future of the Government factories at Woolwich. But at that time Woolwich was employing 74,000 workers—far more than would be required for the peace-time needs of the nation. Thus the Committee were in effect reporting on how the nation should in future procure its arms. For a limited number of orders they had to choose among many potential sources of production—the pre-war ordnance factories, including Woolwich; the old established private armament firms; the new national factories; the other engineering firms which during the war had entered into armament production. If they chose to recommend that Woolwich should continue, and be given work, they were in reality proposing that the other sources of production should be closed down, unless by express reservation they made it plain that means should be found to keep these other sources in existence.

150. By their Terms of Reference they were to have due regard "to the necessity for maintaining a reserve of productive power", i.e. they were specially instructed to consider the question of how to expand armament production when war broke out.

151. Charged with this duty they reported as follows:—

"(a) *Armament production after the War*":

Government Arsenal and Private Factories . . .

"Assuming this to be so, it will still be vitally necessary for the Government to continue to carry out experiments with new forms of weapons and new developments in the material for war introduced by scientific research and therefore a factory or factories either owned by the Government or private trade will be required for this purpose. We consider that the arguments in favour of the retention of a Government Arsenal in peace-time are overwhelming" . . .

"Assuming, therefore, that a Government factory is kept in existence, and that the supply of armaments is greatly reduced in quantity, it more or less follows that the present outlay of the larger private firms for armament production will be considerably reduced, and such manufacture will not improbably disappear as a speciality. It is also probable that the country will insist on the production of all armaments being confined to Government factories; nor would the disappearance of the larger armament firms materially handicap production in the event of a serious war, since during the present war a very large number of engineering firms have been educated in armament manufacture, and the basis for armament supply is now so broad that specialising in the future on the part of a limited number of firms will probably not be necessary for the safety of the country. The magnitude of present day war

operations is such that the reserve of manufacture in peace time for war development cannot be looked on as being concentrated in the Government arsenal and two or three particular firms. The real reserve for war is the whole of the manufacturing power of the country, which has been educated in the supply of armaments."

This statement, taken in its context and under the heading which I have cited, can, I submit, only have one meaning, namely, that the Committee, faced with the choice between the continuance of Government manufacture and the continuance of Private Manufacture, chose Government manufacture, knowing that the price of their choice might be the total disappearance of Private Manufacture and of the "larger armament firms." Yet not once only, but repeatedly throughout their Report, the Committee call attention to the fact that Private Manufacture will probably disappear.

151A. Not only do they make this choice, but they recommend that everything possible should be done to increase the orders given to Woolwich Arsenal.

"We desire to urge", they say, "the desirability of the Government Departments concerned placing as many orders as possible with the Arsenal for Manufacture and Repair, and particularly for naval, military and other Government stores not now produced or repaired there, such for example, as Tanks, Mechanical Transport, and possibly Naval Hydraulic Mountings."

They made no recommendation for giving orders to private firms. This fact must be considered in the light of the recommendation of the Murray Committee in 1907 to increase the orders given to private firms at the expense of the Government factories.

152. Moreover, this recommendation was primarily made by the McKinnon Wood Committee because they had been specially instructed to consider the importance of Woolwich Arsenal in connection with the expansion of production in time of war. Thus:

(a) They say that "as many orders as possible" should be given to Woolwich in order to provide "a larger nucleus for expansion in case of emergency." In this passage they exactly reverse the findings of the Murray Committee in 1907.

(b) In stating the general arguments in favour of retaining a Government Arsenal, they say:

"It is necessary to bear in mind the assistance which such an arsenal can render in training the personnel of new factories, when expansion is suddenly required."

(c) They go on to assert that "the disappearance of the larger armament firms" will not "materially handicap production in the event of a serious war".

(d) In their formal recommendations they propose in detail, as I have explained above, how Woolwich should be prepared and equipped for the task of training and mobilising the general engineering resources of the country.

152A. It must further be particularly noted that they put these proposals forward after having considered and rejected a suggestion of one witness, Major-General the Hon. Sir F. R. Bingham, a member of the Munitions Council, to the following effect:

"That some of the armament firms should be maintained (possibly by means of a subsidy) in a state of readiness to produce munitions immediately a war was imminent, and that, with the exception of one or two, the new National Factories should be closed down and left dormant, their machinery being stored."

It is true that this suggestion was rejected on the ground that the total demand would be too small to encourage private firms, and that "future Parliaments in all probability would not permit of subsidies being granted". But it is plain that if the McKinnon Wood Committee had taken the Murray

* Quoted from *War or Peace: The National Control of Armaments*, by Gilbert Slater, M.A., D.Sc.

Committee's view, if they had thought the existence of private firms to be important for the expansion of armament production in time of war, they would have said so, and would have urged "future Parliaments" to give the subsidies required. They did

nothing of the kind, for the reason, amply shown, as I submit, in their Report, that it was on Government Arsenals and not on private firms that they relied to secure the necessary expansion in time of need.

CHAPTER XIII

The Alleged Difficulties of Defining Armaments

153. It is often said by those who defend the existing system of armament production that the requirements of the fighting forces are now so multifarious that it is impossible to draw the line between armaments and other industrial products; and that therefore armament production cannot be nationalised without the simultaneous nationalisation of most of the industry of the country.

154. This argument assumes a variety of forms, but when the statements of those who use it are carefully analysed they are found to raise four different questions:

(a) What is an armament? Where must the line be drawn between what can and what cannot be used for purposes of attack or defence in time of war? Should, e.g., motor transport and barbed wire be included or excluded?

(b) What is a "component part" of an armament? When does raw material, like iron ore, or a partly finished product of industry, become a "warlike store" which must be dealt with under the plan adopted for the abolition of private manufacture?

(c) What is an Armament Firm? i.e., what firms can properly be said to manufacture armaments in time of peace?

(d) What is a *potential* armament firm? i.e., what firms can adapt their plant for armament production if required?

It is said that to none of these questions can a clear, straightforward answer be made; that in respect of each of them the difficulty of definition is insuperable; and that therefore no workable scheme for establishing a Government monopoly can be drawn up.

The Definition of Armaments.

155. To the first of these questions, however, a straightforward answer can very easily be found. "Armaments" have been defined in the British Government's "Arms Prohibition Order" of 1931.* This Order establishes a number of detailed categories of objects the export of which without a Government licence is forbidden.

This British definition coincides very closely with that contained in the International Convention on the Arms Traffic adopted in Geneva in 1925; and also with the definition contained in the Draft Convention on the Arms Traffic proposed by the United States Government in Geneva in December, 1934. Thus it may be claimed without hesitation that the major Governments of the world have found it possible in these national and international legal documents to designate, with sufficient precision for the purpose of licensing and controlling the international trade in arms, what objects are to be regarded as capable of offensive and defensive use in war.

The Value of the Definition of Armaments.

156. This conclusion is important, since, if the Governments have defined the objects for the export of which they require a licence, they have thereby defined the objects which, if they abolish Private Manufacture, they must forbid private firms to make.

But this does not solve the whole difficulty of definition for the purpose now being discussed. There is a real difference between the problem of defining armaments for the purpose of controlling International Trade and the problem of doing so for the purpose of prohibiting Private Manufacture.

For in seeking to control International Trade the Governments have so far been primarily concerned to prevent the instruments of war from reaching irresponsible persons who may use them to foment civil disturbances, the slave trade, etc. This object can be attained—so far as a license system can attain it—by controlling the trade in "finished" arms alone. For this purpose it would be absurd to control also the "component parts" of finished arms, since the irresponsible persons whose illegal activities it is desired to check are not capable of using such component parts. Thus, for the purpose of such national and international Arms Traffic regulations as have hitherto been made, the definition of armaments proper is sufficient, and the last three of the four questions enumerated in paragraph 154 above do not arise.

But this is no longer true when the abolition of Private Manufacture is considered. For then the Government must decide not only what finished articles, but also what component parts, it will forbid private firms to manufacture and what factories must be nationalised or closed.

The Purpose for which Abolition is Proposed.

157. At this point, however, it is essential to consider the Government's *purpose* in proposing to abolish Private Manufacture. If it desires wholly to eliminate all elements of profit from every industrial and commercial process involved in supplying its armed forces with the means of making war, it will have to go far beyond the prohibition of the manufacture of finished arms alone. At present private firms which make and sell finished arms buy component parts from other firms; these latter buy raw materials from yet other private firms; and every one of these units makes its profit from the commodities which finally become the instruments of war. Thus the firms involved in these processes are very numerous. Moreover, it can be said with considerable truth that, in a broad sense, the Armament industry embraces:

(a) The Iron and Steel industry;

(b) The Motor Engineering industry (for aircraft, tanks, mechanised artillery, army transport and ships);

(c) The Electrical industry;

(d) The Chemical industry.

Similarly the raw materials for armament manufacture include:

(a) Most mineral products;

(b) Many important chemical substances used in industry;

(c) A large variety of agricultural products such as cotton, wood pulp, etc.

If, therefore, the Government desired to eliminate all private profit on every constituent element of every article which ultimately takes the form of arms or munitions it would require to nationalise the greater part of industry.

158. But this is *not* the purpose of most people who advocate the abolition of Private Manufacture. Their purpose is the more practical one of eliminating the vested interests which exercise a baleful influence on public policy in matters of disarmament and peace. And to fulfil this more limited purpose, it will suffice, broadly speaking, to remove the profit motive from the production of armaments proper, as defined in the Treaties and Orders in Council named above.

159. Indeed, when the problem is clearly stated in these terms, it is easily seen that no insuperable problems of definition will arise.

For this more limited purpose, we know already what are the "armaments" with which we have to deal.

* S.R. & O. 1931, No. 413.

And we know too what are the armament factories with which we have to deal.

It may be difficult to say what is an "armament firm" and what is not. It is quite easy to say what is an armament factory. For while it is true, as I have said, that armament manufacture requires the closest co-operation of the iron and steel trade, and of the motor-engineering, electrical and chemical industries, it is also true that armaments are *not* for the most part made in factories where all these industries are linked in a single unit. On the contrary, they are produced in specialised factories which take iron and steel forgings, electrical equipment, chemical substances, etc., as partly finished goods. In this regard, government arsenals and private firms follow much the same practice.

160. These armament factories are in most cases differentiated from other kinds of factories in the following ways:

(a) By the fact that they require a varying proportion of specialised machinery and machine tools which cannot be diverted to peaceful uses.

(b) By the fact that they require a considerable proportion of highly specialised skilled labour.

161. These facts indicate a practical solution of the difficulty of "definition" which would confront a Government desiring to abolish Private Manufacture. It would have:

(a) To forbid the making by private firms of the articles defined as armaments in the national legislation and international treaties referred to above.

(b) To suppress or nationalise the private factories where these articles are made.

(c) To forbid private firms to keep specialised armament machinery and machine tools in their factories.

Potential armament factories, on the other hand (i.e., factories or plant that is not actually making armaments but which could be readily adapted at least to some of the processes involved in armament production) would not need to be considered at all.

162. But this does not solve all the difficulties that will face the Government. There are in particular two questions which will arise:

(a) *Component Parts*.—How far will nationalisation be carried? Will the Government make all component parts or will they buy from private firms? What component parts will they forbid private firms to export to foreign countries?

(b) *Articles which have both a Peaceful and a Warlike Use*.—Will the manufacture of aeroplane engines, which may be fitted to either civilian or military machines, be nationalised or not? How will the Government deal with Chlorine, Phosgene and other chemical substances which are used both for making poison-gas and for various "peaceful" purposes of daily life?

163. If the Government's purpose is that now under consideration, namely, the simple elimination of vested interests capable of exercising an undesirable influence on national policy, a fairly simple working answer can be made:

(a) *Component Parts*.—It may suffice to adopt the principle that Government factories would continue the same practice with regard to component parts which they have followed in the past.

This would only be a rough working rule and would, of course, have to be supplemented by the following additional rules:

(i) All products of a genuinely warlike kind not now made in Government establishments should be among those for which a Government monopoly is set up. Examples are: heavy naval gun mountings, armour-plate, tanks, military and naval aircraft.

(ii) The Government monopoly might also be extended to other important and costly component parts which are not of a directly "warlike" nature, e.g., propelling machinery for warships, boilers, etc.

(iii) It might be better, on the grounds of efficiency, for the State to establish its own plant for making armament steel.

But, with regard to all smaller component parts, e.g., magnetos for aircraft, propellers for ships of war, optical equipment for artillery, and the other very numerous articles of secondary importance which are now purchased as component parts, it would not greatly matter where the line with regard to component parts was drawn. If the existing practice of Government factories in respect of such minor requirements were adapted to the changed conditions of the monopoly regime, it would suffice to ensure that there would be no important group, or groups, of private firms who would have a very considerable direct interest in the increase of armaments at home or abroad. The purpose now under discussion would thus be adequately fulfilled.

(b) *Articles with Double Use*.—Similarly, if the purpose of abolishing Private Manufacture is merely to remove a dangerous vested interest from public life, a simple solution would suffice for the problem of objects with a double use.

Thus, with regard to aircraft, aircraft engines, and chemical substances, it would be enough to inform the private firms in the Aircraft and Chemical Industries:—

(i) that they would receive no more orders from the Government for aircraft, aircraft engines or chemical products of a warlike kind;

(ii) that they would receive no licences for the export of these products to foreign Powers.

164. There would be no danger of substantial evasion of these rules with regard to articles of double use, for the following reasons:—

(i) Government itself would have complete control over all the purchases made for the British armed forces. There is thus no possibility for abuse.

(ii) The Department of Overseas Trade would immediately discover from its detailed statistics of industrial exports if suspiciously abnormal exports of products capable of warlike use were being made. If the exporters could not furnish satisfactory explanations, export licences could be withheld, and if necessary, penalties could be imposed.

Thus, the vested interest of the manufacturers of aircraft, chemical products and other objects of double use in their *military* market would be effectively destroyed.

Would the Proposed Solution Suffice for International Agreement to Abolish Private Manufacture?

165. The simple plan just suggested would also suffice to solve the problems of definition under an international treaty for the abolition of Private Manufacture, provided the only purpose of that treaty were to eliminate the vested armament interest, and provided that the good faith of all signatory Governments in seeking to fulfil this purpose could be assumed.

Abolition of Private Manufacture as a Guarantee against the Evasion of a Disarmament Treaty.

166. But when the abolition of Private Manufacture by international agreement is discussed, another and quite a different purpose is usually assumed, namely, that this abolition combined with international supervision and control of Government manufacture, shall serve as an additional guarantee to prevent evasion of a Disarmament Treaty.

It is this assumption which has introduced so much confusion of thought into the discussions of "definition." For, if the abolition of Private Manufacture is to be used as a means of checking evasion, it can no longer be assumed that Governments will be of good faith, and this changes the whole nature of the problem to be solved. The purpose now in view must be to prevent a disloyal Government from secretly increasing its armed strength above its permitted Treaty limits. To do this it is clearly necessary to make it impossible for such a disloyal Government:

(i) To pile up great quantities of component parts which it can assemble into finished arms when the moment chosen for its aggression arrives;

(ii) To increase the number of factories equipped with specialised armament plant;

(iii) To prepare in advance the industrial mobilisation of factories which are potential arsenals.

For this purpose it would be necessary to have:

(i) An agreed international definition laying down what component parts may or may not be made in private factories;

(ii) An agreed international definition as to what plant and machine tools constitute specialised armament machinery;

(iii) An agreement as to what factories (e.g., State arsenals) may have this specialised plant.

167. The difficulty of defining "component parts" and "specialised machinery" will depend in part upon the nature of the Disarmament Treaty. If the Treaty provided for the abolition of the so-called "aggressive weapons" forbidden to Germany in 1919, this fact would enormously reduce the scale and complexity of the armament industry required in time of peace, and, in particular, would largely remove the difficulty of definition that arises in connection with military aircraft, aircraft engines and chemical products.

168. But even if the first Disarmament Treaty did not go so far, particularly in the direction of abolishing national Air Forces and the chemical weapon, it would not be impossible to find a solution for the problems of definition which would arise.

The solution might take the following form:—

(a) For component parts it should be founded upon the principle proposed to the Disarmament Conference by the Governments of France, Denmark, Poland and Spain. This principle was put forward by these Governments in the following words:—

"The abolition of arms manufacture is not designed to concentrate in the hands of the State all manufacture that might serve to produce arms.

"The sole object is to reserve to the State that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes and destines it exclusively for military use."*

This principle could, no doubt, with common sense, be given a satisfactory practical application. Indeed, it has already been given such an application by the Allied Commissions which carried through the disarmament of Germany in the years that followed the War. How the Allied Commissions arrived at this principle is shown by the following extract from a despatch from the *Times* correspondent in Berlin dated 12th January, 1927:—

"In the course of inquiries I recently made for the purpose of ascertaining the German point of view, I was shown a thick metal disc, about 4 in. across, slightly convex on one side and flat on the other. It represented an early stage in the manufacture of a shell case. It could be made into a shell case, but it could also be made into a metal bowl or jug. Similarly I was shown a small gun-metal cup, which by a series of subsequent processes could be transformed into a rifle cartridge case; but by a different process it could also be made into one of a dozen other things. *There is in these and most other partly-wrought manufactures a point at which the respective processes of manufacture separate. It is at this point that the definition 'destined for the purpose of war' becomes applicable and the object of the object is prohibited.*"

The Allied Commissions applied this principle to component parts in a thorough manner and established carefully elaborated categories of such parts which German manufacturers were not allowed to make either for home consumption or for export.

These categories were finally embodied in a German law passed by the Reichstag in 1927. A translation of the text of this law, taken from the Board of Trade Journal of May 17th, 1928, is reproduced in Annex D attached to this statement. I venture to direct the special attention of the Commission to Sections 3, 4, 7 and 9 of this German law.

(b) The Allied Commissions made similar regulations concerning the specialised armament machinery and machine-tools which German manufacturers were not allowed to possess. The principle of these regulations was embodied in the same German law (see Sections 8 and 9).

Without doubt the control of specialised armament machinery and machine-tools might be of great importance in preventing disloyal evasion of a Disarmament Treaty. The Allied Commissions in Germany had prolonged discussions with German manufacturers and the German Government on this matter, and refused to give way to the demands which Germany made to be allowed to possess such specialised machinery and machine-tools. Commenting on this decision the *Times* correspondent in Berlin said in a despatch dated January 6th, 1927:—

"To give way on the question of machinery for the manufacture of arms would be to undo all the work the Commission has done since the War, and to render the disarmament of Germany a myth."

I submit to the Commission that an international arrangement founded on the principle embodied in the German law of 1927 would furnish a working system which would satisfactorily solve the problem now under discussion.

No doubt it would require administration by competent experts who were thoroughly familiar with the problems of armament manufacture; but obviously only such experts would be chosen to administer it and, as members of the International Commissions of Supervision and Control to be set up, they would be given the rights and powers which were necessary to enable them to discharge their task.

(c) But in respect of objects of double use—aircraft and chemicals—a difficulty would still remain. Whether national Air Forces and the chemical weapon were abolished or were merely limited, it would still be necessary to take special measures to prevent evasion of the terms of the Disarmament Treaty. These measures would have to include:

(i) Special regulations governing aircraft factories, to control their output of finished machines, engines, spare parts, etc.

(ii) Special regulations governing chemical factories to control their plant and their output of substances capable of use for war.

(iii) A special system of stringent international inspection and control by qualified experts to ensure that these regulations were observed, and that abnormal quantities of potential war material were not produced.

(iv) A special agreement for mutual assistance among the Signatories of the Disarmament Treaty against any State which violated its obligations in respect of Air or Chemical Disarmament.

There would be no insuperable difficulty in establishing regulations and control of this kind. The Disarmament Conference did a good deal towards drawing up a practical plan in this regard; but as the matter may be held to fall outside the immediate scope of the Commission's inquiries, I will not discuss it further.

Conclusions.

169. From the above discussion I venture to draw the following conclusions for the consideration of the Commission:—

(a) Armaments have been defined in national legislation and international treaties, and in particular in a British Order in Council of 1931, with all the precision required for the purposes of the abolition of Private Manufacture by Great Britain acting alone.

* Conf. D./C.G. 48, March 3rd, 1933. See Annex B.

(b) If the Private Manufacture of the articles thus defined as armaments were forbidden, the problem of component parts could be solved on the basis of the present practice of Government Arsenal and Ordnance Factories adapted and modified as His Majesty's Government might find convenient and wise.

(c) The adoption of this plan with regard to component parts would not eliminate every element of private profit from the manufacture of arms, but it would do so in a sufficient degree to carry out the social and political purposes for which the abolition of Private Manufacture is desired.

(d) The above plan would suffice as the basis of an international treaty for the abolition of Private Manufacture, provided the purpose of that Treaty were only to eliminate the present influence of the vested armament interests from public life, and provided that the good faith of Governments in applying the treaty could be assumed.

(e) If, however, it were desired to adopt a more far-reaching and watertight solution of the problem of component parts, that put forward in the Memorandum of the French, Polish, Danish and Spanish Governments could be adopted by the Government armament establishments. The German law of 1927 should give all the guidance that is required for the drafting of whatever legislation, Orders in Council or Regulations might be necessary.

(f) This law, and the experience of the Allied Commissions in Germany, would also suffice to guide the officials charged with the practical administration of the Regulations adopted.

(g) It would be necessary to adopt this more far-reaching solution if the abolition of Private Manufacture and the control of armament production were intended to operate as an additional guarantee that the limits of armed strength allowed by a Disarmament Treaty would not be secretly evaded by a disloyal Government.

(h) The legislation passed for this purpose by the States signatory to the Disarmament Treaty would have to lay down precise and comprehensive regulations concerning:—

(i) The component parts which private firms are forbidden to manufacture.

(ii) The specialised armament machinery and machine-tools which private firms are forbidden to possess.

A model for the definitions required would again be furnished by the German law of 1927.

(i) For the Aircraft and Chemical Industries additional guarantees, including specially stringent international control and inspection, would be required to prevent the evasion of the restrictions of a Disarmament Treaty.

(j) No difficulty concerning the Aircraft and Chemical Industries will arise, however, if Private Manufacture is abolished by Great Britain acting alone.

CHAPTER XIV

The Difficulties Involved in Foreign Trade if Private Manufacture were Abolished

170. It is sometimes said that if Private Manufacture were abolished it would cause great difficulty in the following ways:—

(a) Non-arms-producing States would be placed in a dangerous position, since they would be at the mercy of the Governments of the producing powers;

(b) In consequence of this, Great Britain, if she abolished Private Manufacture by unilateral action, would lose the whole of her present export trade in arms;

(c) If Private Manufacture were generally abolished by international agreement, and inter-governmental trading in arms thus became necessary, this would introduce undesirable new factors into international affairs, since arms-producing Governments would bring pressure on non-producing Governments to increase their orders;

(d) Difficulty would arise from the International Law of Neutrality, since under that Law no Government may furnish arms to another Government which is at war. This, it is said, would:

(i) Place non-producing States at the mercy of any of their foes who had arms-manufacturing capacity of their own;

(ii) Deprive producing countries, such as Great Britain, of important markets for their products;

(iii) Deprive Great Britain in time of war of important sources of armament supply, e.g., from the United States of America, from whom she obtained such large quantities of munitions in the last war.

(e) In consequence of the dangers to which they would be thus exposed, non arms-producing States would be driven to establish Government arsenals of their own and the total capacity for armament production throughout the world would, therefore, be greatly increased.

The Attitude of Non-arms-producing States.

171. It is generally assumed by those who use these arguments that the non-arms-producing States have unanimously and vigorously protested against the proposal for the abolition of Private Manufacture.

This is not the case. The question of Private Manufacture has been under discussion in Geneva in various forms for many years. In these discussions

the representatives of non-arms-producing States have always been present and have taken part in the debates. Their attitude may be shown by the following summary of facts.

171A. On 12th December, 1925, the Council of the League of Nations addressed a Questionnaire to the Members of the League, inviting them to give their views concerning the nature and extent of the "grave objections" to Private Manufacture, and inviting them to make suggestions about the action which the League should take. To this Questionnaire a considerable number of non-arms-producing States sent answers. Three of these answers—from Turkey, Australia and Greece—appear at first sight to be favourable to the system of Private Manufacture; but closer examination shows that the answers are capable of other interpretations. Of the other replies from non-arms-producing States, none was definitely in favour of Private Manufacture, or declared that it was essential to their national defence. Bulgaria was definitely in favour of its abolition. Cuba, Latvia and Norway all stressed the evils of Private Manufacture and Norway strongly urged the advantages of its abolition. Colombia and China declared that Private Manufacture was already prohibited in their countries. Estonia and Venezuela wrote elaborate answers, but made no defence of Private Manufacture.

172. There were further discussions in 1928 and 1929 on a Draft Convention which provided for the publicity of armament manufacture by private firms. In these discussions, the non-arms-producing States insisted that if publicity were established for the private armament industry, it should be established for Government Arsenals as well. They did not defend Private Manufacture as a system; they only demanded equality of armament-publicity for all.

173. In 1932 and 1933, the Disarmament Conference in Geneva discussed Private Manufacture on a large number of occasions. Eventually, on the motion of France, a special Committee of the Conference was created to consider the whole subject of the Manufacture of and Trade in Arms. Four countries—France, Denmark, Spain and Poland—laid proposals before this Committee for the total abolition of Private Manufacture by International agreement. These proposals were opposed by a few of the arms-producing States; they were not opposed

either in the Committee or in the General Commission of the Conference by the representatives of the non-producing States. Turkey and Persia went even beyond France by proposing the full internationalisation of arms manufacture. *No non-arms-producing State declared that Private Manufacture was essential to its safety.* The representatives of a number of non-arms-producing States—in particular Canada, Norway and Denmark—declared themselves in favour of the total abolition of Private Manufacture. Denmark prepared, and, with the help of France, Spain and Poland, laid before the Conference a special memorandum in which it specifically answered the argument of the arms-producing countries that abolition would damage the interests of the non-arms-producing States. The memorandum said:

"The non-producing States derive no benefit from the system of Private Manufacture. The abolition of this system would not, therefore, modify the situation of non-producing States in any way."

The language could not have been clearer, and it was not challenged by a single representative of a non-producing State.

I submit to the Commission that the above facts justify the conclusion that the non-arms-producing States are not opposed to the abolition of Private Manufacture.

Abolition and the Position of Non Arms-producing States.

174. It is none the less necessary to examine the arguments of those who hold that abolition would in fact be detrimental to the interests of the non-producing States. These arguments may be stated and answered in turn.

174A. First, it is said that no Government would ever willingly purchase arms from the state arsenals of another Government, because to do so would place it at the mercy of the selling Power, since the latter could withhold supplies whenever it desired.

This argument assumes that the Governments of arms-producing States regard their private manufacturers as entirely free to export arms without engaging the Government responsibility in any way.

But this is not the case. In the Franco-Danish-Polish-Spanish memorandum already cited it is said:

"Even in the present state of affairs Arms are only consigned by a private factory with the assent of the Government on whose territory that factory is situated."

In other words, Governments of arms-producing States already apply the principle of Government responsibility for the export of arms and exercise an effective control which permits them to prohibit those exports whenever they think it right or advantageous to do so. There are, indeed, many examples of "Arms Embargoes" in recent times, including the embargo until recently imposed by a large number of Governments on the export of arms to Italy and Abyssinia, and still maintained in respect of Italy.

In view of these facts, it is difficult to see in what way non-arms-producing States would lose their freedom and become dependent on producing Powers if Private Manufacture were abolished.

175. Second, it is said—it is, indeed, only a variant of the first argument—that if Private Manufacture were abolished, the Governments of non-producing States would have more difficulty in buying from the Governments of producing States than they have in buying from private firms to-day.

Again, this argument is pure assumption, unfounded on any grounds of experience at all. If a National Armaments Board, of the kind proposed by Colonel Carnegie, were to be set up, foreign Governments would have every advantage in dealing with the disinterested expert technicians who would conduct the business of that Board. They would receive goods at cost price; they would be certain that the quality of the goods was above reproach; if, for any reason, they desired to change, they could always deal with the Government of another

arms-producing State; they could have every confidence that the Governments of the arms-producing States would never make a "ring" to exploit the other nations of the world. On grounds both of theory and experience, therefore, there is at least a case for thinking that the position of non-arms-producing States would not be worsened, and might even be improved, by the abolition of Private Manufacture.

It follows from this conclusion that Great Britain would not necessarily lose all her export trade in arms, even if she alone abolished Private Manufacture.

Would Inter-Governmental Trading be open to Grave Objection?

176. Third, it is argued that inter-Governmental trading in arms would be a most dangerous thing to introduce. Sir John Simon has stated this objection in the following way:

"If a manufacturing State had arms to sell, one would fear that it might have ways of influencing prospective purchasers far more powerful than private individuals." (*Times*, 7th December, 1934.)

Mr. Baldwin has used even plainer language:

"He was convinced that the contrary was the case, that so far from leading to a decrease in armaments, it would lead to an increase. If the private manufacture of arms was abolished, arms would have to be made by the State. The expense of that would be enormous. The State manufactory could not sell to a country in time of war."

"Would they get rid of the corruption that was alleged in connexion with the sale of armaments to certain countries? The Government would have to employ thousands and tens of thousands of men, and would it be content always to see these men out of work in slack times? Would there be no temptation to offer loans to foreign countries to buy armaments? Would there be no temptation in making trade agreements to reserve a peculiar position for armaments?" (*The Times*, 24th November, 1934.)

In reply to these contentions, I submit the following points to the consideration of the Commission:

(a) I have not been able to find any record in any country of workers in Government arsenals agitating for an increase in armaments to provide them with employment.

(b) If a Government strove to increase the armaments of foreign Powers by the methods suggested it would be acting in a manner detrimental to the interests of its own nation, since every increase of arms by foreign Powers tends to raise the level of armaments all round, and so to reduce its own margin of security.

(c) If the British Government, acting alone, abolished Private Manufacture, public opinion in this country would never tolerate action by a National Arms Board of the kind suggested by Sir John Simon and Mr. Baldwin.

(d) If Private Manufacture were abolished by international agreement, its abolition would unquestionably be accompanied by the simultaneous establishment of a stringent system of publicity and international control of Government armament manufacture in every signatory country. The French Delegation to the Disarmament Conference put forward a detailed plan for such publicity and control. Such a plan, combined with measures of control for the Trade in Arms would give an effective guarantee that no Government would take the risk involved in seeking to increase armament orders for its arsenals by improper means:

(e) Such a system of international control, combined with the abolition of Private Manufacture, would make it much more difficult than it is now for Governments to exercise their influence in favour of the increase of exports of arms from their countries.

It is known that many Governments have used their diplomatic missions abroad to support the efforts of the agents of their private armament firms. It is known that some Governments have even granted loans to foreign Governments on condition that these loans were spent, in whole or in part, upon the purchase of arms from the private firms of the lending countries.

The facts of these cases show that under the existing system Governments can already use their influence to increase the sale of arms, if, under the pressure of General Staffs or vested interests, they decide to do so; and they further show that while the present system continues they can disguise their responsibility for doing so under the cloak of private firms. The abolition of Private Manufacture would make it, therefore, not more likely, but less likely, that such abuses would happen as Mr. Baldwin and Sir John Simon suggest.

The Difficulties arising from the Law of Neutrality.

177. The next argument is derived from the International Law of Neutrality. It is said that under this Law no Government may furnish arms to a belligerent State and that, therefore, the non-producing States would, in time of war, be wholly deprived of all outside supplies and would thus be at the mercy of any enemy who had an armament industry.

This argument assumes that all Governments still accept the old International Law of Neutrality as the binding rule for their conduct when war occurs.

But this assumption:

(i) Is inconsistent with the principle of Government responsibility discussed above;

(ii) Is inconsistent with the Covenant of the League of Nations, to which 57 nations are signatory;

(iii) Is at least doubtfully consistent, as Mr. Stimson has said, with the Pact of Paris for the Renunciation of War.

The true situation with regard to neutrality has been authoritatively declared in a White Paper laid by the Secretary of State for Foreign Affairs before the House of Commons in 1929. The essential passages of this memorandum are as follows:—

"The effect of these instruments" (the Covenant of the League and the Pact of Paris) "taken together is to deprive nations of the right to employ war as an instrument of national policy and to forbid the States which have signed them to give aid or comfort to an offender. As between such States, there has been in consequence a fundamental change in the whole question of belligerent and neutral rights. . . . The situation which we have to envisage in the event of war in which we were engaged is not one in which the rights and duties of belligerents and neutrals will depend upon the old rules of war and neutrality, but one in which the position of the Members of the League will be determined by the Covenant and the Pact. . . ."

And after some further argument, the Memorandum concludes: "In other words, as between Members of the League there can be no neutral rights, because there can be no neutrals."^{*}

It was on the strength of this Memorandum that the House of Commons authorised His Majesty's Government to sign the Optional Clause attached to the Statute of the Permanent Court of International Justice. Its authority is, therefore, beyond dispute. It follows from the conclusions of this Memorandum:

(a) that no Member of the League is entitled to permit his private manufacturers to furnish arms to a State guilty of aggression;

(b) that under Article 16 of the Covenant every Member of the League is under obligations to assist a country which is the victim of aggression in its national defence, i.e., every Member has the right, if not indeed the absolute duty, to furnish the victim, so far as it may be able to do so, with arms and munitions.

^{*} Cmd. 3452, 1929, pp. 9-10.

[†] *ibid.*, p. 10.

Thus under the Covenant and the Pact of Paris non-arms-producing States would risk nothing from the abolition of Private Manufacture. Indeed, they would have everything to gain, since they are more likely than producing States to be the victims of aggression and, since in such a case, the new rules of the Covenant would be more likely to be loyally applied if all arms-production were in Government hands.

To give a concrete illustration of the point, it may well be doubted whether any Government would have taken the responsibility of furnishing arms to Japan when she invaded China in 1931, or to Italy when she was preparing to invade Abyssinia in 1935; yet private manufacturers supplied both countries on a large scale.

The position of Great Britain if Private Manufacture were generally abolished.

178. Another argument derived from the International Law of Neutrality runs as follows:

It is said that if Private Manufacture were generally abolished by international agreement, Great Britain would, under the working of the law of Neutrality, be cut off from foreign supplies of arms which might be vital to her success in time of war. In support of this argument the vast quantities of arms and munitions obtained from the United States of America during the last war are usually cited.

In reply to this argument, I submit the following points to the consideration of the Commission:

(a) As a Member of the League, Great Britain, if the victim of aggression, would be entitled to receive arms from all the other Member States:

(b) Great Britain would further be entitled to receive arms from the United States of America, if the United States chose to send them. But, under the present Neutrality Resolutions of the United States Congress the United States Government is legally prevented from authorising the export of arms to any State engaged in war. If these Resolutions, as seems probable, should be made permanent, Great Britain could no longer hope that the United States would do again what it did between 1914 and 1918. There is no other State, whether a Member of the League or not, which is likely to be able in any future war to furnish quantities of munitions at all comparable to those sent during the last war from the United States.

(c) Since the present Prime Minister has repeatedly declared that the Covenant is the sheet anchor of British foreign policy, it is obviously necessary that, in such questions as these, policy should be based upon the assumption that Great Britain intends to observe its international obligations and to claim its international rights under the Covenant. This excludes the hypothesis of a war in which Great Britain is the aggressor, or in which she would not be entitled to the assistance of the other Members of the League.

Would the Abolition of Private Manufacture Increase the Arms-Producing Capacity of the World?

179. There is one more argument to be considered under the heading of Foreign Trade.

It is that the abolition of Private Manufacture would place the non-arms-producing States in so dangerous a position that they would all immediately create new national armament industries of their own. It is sometimes added, as a rider to this argument, that even arms-producing States like Great Britain would be obliged greatly to expand their national arsenals to make good the loss of all supplies from neutral States in time of war.

The net result of abolishing Private Manufacture, therefore, according to those who use this argument, would be a vast and wasteful addition to the arms-producing capacity of the world.

In reply to these contentions, I submit the following points to the attention of the Commission:

(a) If Private Manufacture is generally abolished by international agreement, that, in itself, will be an important indication that the major Governments of the world desire to follow a policy of peace, and that the new international law of the Covenant and the Pact of Paris will be observed. The non-arms-producing States will thus have much less motive than they have to-day for incurring the heavy and wasteful expenditure involved in trying to create new armament industries on their national territories.

(b) In any case, it is doubtful whether many of the non-producing States could create an armament industry, however hard they tried. In support of this contention it may be said that:

(i) There is no industry which requires such exact precision, such high grade material and such skilled labour as the making of arms. The processes of armament manufacture are so complex that they can only be carried out in establishments which have achieved the highest standards of industrial technique;

(ii) There is no industry where careless work or defective products are so dangerous;

(iii) The making of armaments requires the existence side by side with the armament factories of an iron and steel industry, an electrical industry and a chemical industry.

Thus, there is little likelihood that any non-industrial State could hope successfully to manufacture arms for itself. Even if it succeeded in establishing a national arsenal it would, in all probability, be little more than an assembling shop dependent for all important component parts upon supplies from the industrial countries, i.e., from the countries which now make arms.

How true this is, was demonstrated by the experience of the last war. The belligerents were then seeking munitions from every corner of the world; money was no object; and profits on armament manufacture were fabulously high. In spite of these inducements, no non-producing State made any considerable attempt to create an arms industry to meet the demand.

Even in Canada and Australia, where the engineering industry is considerably developed and where technical skill is high, the cost was so great that the arms manufacture begun during the War was abandoned when peace was made.

(c) The same point may perhaps usefully be restated in another way. Wherever it is possible profitably to create an armaments industry, the great private armament manufacturers of the world have already done so.

Their task has been, of course, facilitated by the Governments of the world, for very many Governments accept the doctrine that the possession of an armaments industry is an important factor in national defence. Thus Governments of non-producing States have invited the private firms of producing countries to come and establish armament factories on their territory. In this way British armament firms largely built up the armament industry of Japan, while Schneider has built up the armament industry of modern Poland.

It is thus at least possible to argue that the establishment of new and unnecessary national arsenals is a greater danger under the existing system than it would be if Private Manufacture were abolished. For national arsenals could not lend themselves to creating armament factories abroad, as private armament firms habitually do.

The Export of Arms-Producing Capacity, and the Balance of National Advantage.

180. As has just been said, private armament firms export not only finished arms but also arms-manufacturing capacity. I have discussed above to what extent the export of finished arms increases the military strength of a country. I have shown that the differential advantage so to be obtained is relatively small. But the considerations put forward in the last paragraph raise the question whether there is really any differential advantage at all. By their creation of armament industries abroad, do not private armament firms export a far greater amount of manufacturing capacity than they add to the manufacturing capacity of their own country by their exports of finished arms? When the question is put in these terms, the answer is plain. An examination of the international connections of the big British armament firms, of their foreign branches, subsidiary companies, factories and shipyards overseas, shows that they have exported far more arms-manufacturing capacity to the outside world than the meagre addition which their exports of finished arms have made to the manufacturing capacity of Great Britain. The work of Vickers and Armstrong-Whitworth in Japan, with its effect on the naval position of Great Britain in the Pacific, is an instructive example.

I submit that it is indeed evident that the creation of new arms factories in non-producing States would be a more difficult enterprise and, since there would be no profit in it, one less likely to be carried through after Private Manufacture had been generally abolished than it is to-day.

Conclusions.

181. It follows from the above discussion that:

(a) Great Britain would not necessarily lose all her export trade in arms if Private Manufacture were abolished, either by general international agreement or by Great Britain acting alone (cf. also paragraphs 174 and 175 above).

(b) The alleged dangers to non-arms-producing States of the general abolition of Private Manufacture have not alarmed these States themselves.

(c) The fears voiced on behalf of the non-arms-producing States by the spokesmen of producing States and private firms rest on invalid assumptions about the impossibility of inter-governmental trading and about the pre-League International Law of Neutrality.

(d) The evils which it is predicted would result from inter-governmental trading already exist in some degree. There are some grounds for thinking that they are more likely to occur under the present system, since Governments can now cloak their responsibility under the cover which private firms provide.

(e) There is no reason to think that, if Private Manufacture were abolished, non-arms-producing States would create arms industries of their own. Indeed, the creation of new arms industries is more likely to occur under the stimulus of the profit motive than if Private Manufacture were not allowed.

(f) There are no valid grounds for asserting that Great Britain would be cut off from valuable foreign supplies of arms in time of war if Private Manufacture were generally abolished.

CHAPTER XV

The Alleged Technical Difficulties of carrying through the Nationalisation of the Armament Industry.

How a Government Monopoly would be set up.

182. It is sometimes said that even if His Majesty's Government desired to nationalise the armament industry, the technical difficulties of that operation would be such that it would be impossible to carry it through.

I believe this view to be largely due to confusion of thought. It may help to clarify the issues involved if I give a brief summary of the method by which I believe nationalisation could be effected.

I suggest that the following measures would be required:—

(a) It would be announced by His Majesty's Government that, after a certain date, with probably one or two years' notice, that:

(i) no more arms or munitions would be purchased for the British Armed Forces from private firms;

(ii) no further licences would be issued to private firms for the export of arms or munitions to foreign countries or to British Dominions overseas.

(b) Arms and munitions would be defined in these announcements to mean the articles already listed in the Order in Council of 1931, which now governs the export of war material.

(c) Regulations would be prepared and issued laying down the component parts of arms and munitions which private firms would not be allowed to manufacture for the Home Government or for export.

(d) Regulations would be issued laying down what specialised machinery for armament production private manufacturers would be forbidden to possess.

(e) To prevent the transference of private capital and private experts to foreign countries where Private Manufacture might not have been abolished, the Government should also forbid any British subject:

(i) to invest capital in armament production in foreign countries or in British Dominions overseas;

(ii) to take service in private firms engaged in armament production in foreign countries or in British Dominions overseas;

(iii) to engage in any form of private trade or commerce in arms or munitions of war, whether at home or abroad;

(iv) to enter the employment of national arsenals in foreign countries or British Dominions overseas without the previous consent of His Majesty's Government in the United Kingdom.

(f) The above decisions would be made legally effective by Order in Council or by Parliamentary legislation as the Law Officers of the Crown might find to be necessary. Offences against these Orders in Council or Statutes would be made punishable by heavy penalties, including, if necessary, the loss of British nationality.

The Technical Aspects of the Process of Nationalisation.

183. I submit to the Commission that the nationalisation of the armament industry would, from the technical point of view, be an exceedingly simple matter. I believe this to be true for the following reasons:—

(a) There are already in existence Government Arsenals, Dockyards and Factories which have in the past produced almost every possible kind of armament requirement.

(b) The expert knowledge of those in charge of these Government establishments, and the equipment which these establishments already possess, would enable them immediately to undertake almost any kind of armament production on which they are not now engaged.

(c) If for the production of some types of arms these Government establishments required new plant, the knowledge of their directors and the skill of their workers would enable them to use the new plant and engage in these unfamiliar processes of armament production without difficulty.

(d) Apart from actual production, the Government establishments already comprise highly organised services for armament design, for testing of armaments, for repair, etc.

(e) The Government already possesses a machinery for co-ordinating orders from the Service Departments, and for organising the delivery of finished goods to the Armed Forces of the Crown. This machinery might be more highly developed and might, with advantage, assume the kind of organisation which was given to the Ministry of Munitions during the War. The nucleus, however, already exists.

(f) If the export of arms continued from Government arsenals, it would probably be necessary to organise a National Armaments Board of the kind proposed to the Commission by Colonel Carnegie. This is in any case desirable on other grounds. Its organisation would present no difficulty of any kind.

Would the existing capacity of the Government Arsenals and Factories suffice?

184. As I have suggested in a previous section of my statement, it is not possible to say in advance whether the capacity of the existing Government arsenals would suffice for the production of the armaments required by the Army and Navy and Air Force, or whether this capacity would have to be increased. I have pointed out above that:

(a) In this regard everything would depend on whether or not a Disarmament Treaty is made in the near future, and on how much the annual requirements of arms and munitions might be reduced by that Treaty.

(b) If the reductions made were approximately those proposed in the draft Treaty laid before the Disarmament Conference by the British Prime Minister on 14th March, 1933, the capacity of existing arsenals and factories would be more than sufficient.

(c) If greater capacity is required, Woolwich Arsenal and others of the Government Ordnance Factories could be largely expanded without the erection of new shops.

(d) If additional machinery and plant were required for such expansion of existing Government Factories, it could either be acquired from the existing plant of the private firms, or new machinery could be obtained, as might be deemed most advantageous. No technical difficulty could conceivably arise in this regard, since the scrapping of old machinery and the installation of new machinery is a matter of routine in all Government Ordnance Factories, as it is in engineering works of all descriptions.

(e) If further capacity were required beyond that which could be obtained by the expansion of the existing Arsenals and Ordnance Factories, the Factories of the private firms could be purchased and taken over. As the evidence of the Union of Democratic Control has so admirably shown, most of the shops which produce arms are segregated from the rest of the non-armament factories of the private firms; thus, for example, there would be no difficulty in taking over the gun pits at Elswick, without taking over the rest of the plant. If no new Treaty of Naval Disarmament is made, and naval armaments continue to expand, it might be necessary to take over some of the shipbuilding yards now used by private firms for the construction of ships of war.

(f) If national Air Forces are not abolished by international agreement, it would be necessary to take over some, or all, of the factories of private firms now engaged in the manufacture of military aircraft. In practice, however, it would almost certainly be advantageous to suppress a considerable number of these factories and to expand others.

Compensation for the shareholders of Private Armament Firms.

185. No difficulty should arise in arranging compensation to the shareholders of the private firms now engaged in armament manufacture.

Thus:

(a) If machinery or factories were purchased by the Government from such firms, payment would be made on the basis of a fair market valuation. If a dispute arose about the fairness of the price offered, the matter could be submitted to arbitration by impartial experts. The Government could be trusted not to do injustice to the shareholders of the private firms.

(b) It might also be necessary to compensate the shareholders of the private firms for the loss of prospective profits on the production of the machines and factories not taken over by the State. Except in so far as these machines and factories could be adapted to the production of "peaceful" goods, the capital invested in them would become a dead loss as the result of the abolition of Private Manufacture. What, if any, compensation should be made should be determined by arbitration. The arbitrators would no doubt take into account two main considerations:—

(i) The private firms have been encouraged to invest capital in these factories and machines by the deliberate and sustained policy of His Majesty's Government, who have led them to expect the indefinite continuance of armament orders in times to come.

(ii) Subsidies, direct and indirect, have, however, been paid by the Government to the private firms for the maintenance of specialised armament plant when it has been standing idle. Again, on the basis of the facts of each particular case, there should be no insuperable difficulty in reaching an equitable settlement.

(c) It may be pointed out that even taking over a large proportion of the plant of private firms would not involve the Government in a very large scale capital investment. As a tentative indication of what might be required, I suggest that the figure would not exceed £20,000,000—a very small amount in view of the annual expenditure of the nation on war material of all kinds.

(d) It might also be necessary to provide compensation for expert workers thrown out of work by the abolition of Private Manufacture. I give reasons below for thinking that the number of such workers would be very small. If a grant of public money were required for this purpose, public opinion would no doubt regard it as justified, unless it were open to objection on other grounds of principle.

How far should Nationalisation be carried?

186. As said above, it would be necessary for the Government in their announcement of the abolition of Private Manufacture to lay down clearly what component parts private firms would no longer be allowed to make, either for home consumption or for export, and what specialised machinery they would not be allowed to possess. So far as the fulfilment of the social and political purposes of the policy of abolition is concerned, I need add nothing to what I have already said on this point in paragraphs 157 *et seq* of my evidence above dealing with the alleged difficulties of "definition."

187. There is, however, a further point which would arise, i.e., whether considerations of efficiency would not make it wise to extend nationalisation beyond the point which I there suggested would be necessary for the fulfilment of these social and political purposes.

188. For example, it would arise for consideration whether the Government should not establish its own Steel Plant in order to provide its own factories with their forgings.

On this point I am in full agreement with the evidence presented by the Union of Democratic Control, and I venture to cite in further support of their view the evidence presented to the McKinnon Wood Committee in 1918 by the Superintendent of the Gun and Carriage Factories, Colonel M. J. C. Dennis, C.B.:

"Woolwich was the only armament-making concern which was dependent on others for supply of steel. The supply of steel being almost entirely in the hands of the Steel Ring, competition was practically absent, and Woolwich prices were affected by being saddled with an extra profit to the firm supplying the steel, over which they had no control. This applied, to a large extent, to carriages and mountings which were now universally of steel, but particularly to guns. In heavy guns, practically half the total cost of the finished gun body was the cost of the raw steel. The only remedy would seem to be the establishment of Government steel works in some suitable centre, but certainly not at Woolwich, to supply the Government factories with steel. An example of the degree to which Woolwich was even now in the hands of the steel-making firms occurred recently. Woolwich was asked to manufacture certain guns urgently required by a certain date. They agreed to do so, subject to the supply of the necessary steel to make the forgings, within six weeks. Supply of the steel was in the hands of the Ministry, who in due course informed Woolwich that the steel could not be supplied, but that the forgings could be supplied. Colonel Dennis pointed out in reply that they preferred to make their own forgings, and that, if forgings that, admittedly, were not already made could be supplied, the steel from which to make them must be available. In the end, however, Woolwich was supplied with forgings which they could have made better and more cheaply, the obvious and only inference being that there was more profit in the supply of forgings, and that even the Ministry could not enforce the supply of blooms in lieu of forgings."^{*}

189. I would further suggest that it would probably be economically advantageous for the Government to establish its own plant for the production of most of the metal and alloy component parts of aircraft.

190. Of course, as I have said above, the Government should be wholly responsible for all specialised forms of armament production now left to private firms, e.g., the manufacture of tanks, aircraft, armour-plate, heavy gun mountings, etc.

^{*} Quoted from *War or Peace: The National Control of Armaments*, by Gilbert Slater, M.A., D.Sc.

CHAPTER XVI

The Alleged Difficulties of Working a Government Monopoly of Armament Production

Fluctuation of Demand and, therefore, of the Scale of the Armament Industry.

191. It is argued in favour of Private Manufacture that, owing to political causes, the armament industry is subject to fluctuations more violent than that of any other trade. It is pointed out that in the period of 20 years which preceded the war of 1914, the industry was continually increasing in scale and output; that during the War it was expanded to such a degree that it employed a great part of the total resources of the nation; that after the War there was a period of rapid contraction, followed by almost total stagnation; and that, since the Disarmament Conference ceased its sittings in 1933, the process of expansion has once more begun. It is said that the system of Private Manufacture enables

the Government to keep the volume of employment in State arsenals and factories at a moderate but steady minimum throughout times of expansion and contraction; and that the private armament firms can take up the additional orders which are available when armaments expand, while during periods when the armament trade is slack, they can employ their plant in producing "peaceful" products for the general market, as Government arsenals cannot.

191A. I suggest to the Commission that this argument should be considered separately on the basis of the two different hypotheses I have discussed above, namely, that of a system of organised international disarmament and peace, and that of international anarchy and armament competition.

Under a system of International Disarmament.

191b. It is plain that under a system of international disarmament this alleged difficulty has no substance. The terms of the Disarmament Treaty would lay down the permitted amounts of armament which each signatory State was allowed to possess. The Government of each State could, therefore, plan its armament production from the long period point of view, and could lay down in advance a regular annual programme which would keep the work in its Government Arsenals at a steady figure.

An examination of the naval construction done during the years 1920-1935, while the Treaties of London and Washington were in force, will illustrate the point. It will incidentally show that all the naval requirements of the nation under these Treaties could quite easily have been supplied by the Royal Dockyards and Government factories.

In Conditions of International Anarchy.

192. But even on the basis of the second hypothesis, namely the system of international anarchy, the argument outlined above is not wholly convincing. It is at least possible to contend that the greater the fluctuations in the demand for armaments the stronger the case for nationalisation.

I submit the following points for the consideration of the Commission:—

(a) The risk involved in the contraction of armament orders, with its consequences of unremunerated capital, idle plant and widespread unemployment, ought to be borne by the State rather than by private firms. The fluctuations in armament demand result directly from national policy for which the Government is responsible, and in formulating which the private manufacturer ought to have no share. There is no doubt that under the present system the fluctuations of armament demand may cause severe hardship to the shareholders, the managing staff and the workers in armament firms; this is proved by the fact that the directors of such firms have frequently, and with evident sincerity, protested in vigorous terms against this hardship.

(b) When the Government had assumed full direct responsibility for the production of all armament requirements, it would have a greater incentive to equalise its demand from year to year and thus to minimise the fluctuations which occur. This incentive might perhaps affect its armament policy though not, I believe, in the direction of stimulating an increase in the level of armaments which it maintains. It would, at least, bring strong pressure on the fighting Services to plan their requirements in advance and not to ask for large unforeseen deliveries at the last moment except in case of urgent political necessity.

(c) The private firms cannot beyond a certain point transfer their plant from armament work to production of peaceful products. The argument on this point is, as a rule, greatly overstated. I cite, for the consideration of the Commission, the judgment of a distinguished private manufacturer of armaments, Sir Robert Hadfield:

"It is doubly unfortunate that the cost of putting these theories (i.e., disarmament) into practice should fall in the main upon an industry which is already struggling against unfair economic conditions which are beyond its control.

"The politician is always ready with advice to turn over to peaceful products, not realising that highly specialised plant cannot be diverted in this way, and further, that the supply of those peaceful products already far exceeds the demand, so that such a remedy, even if practicable, would merely add to the difficulties of other sections of the trade. Apart from this, such a course would represent the loss to the nation of those specialised sources of production—the men and the machines—built up by years of research, which saved the situation in 1914, and which could not be extemporised in any future emergency."*

* *Times*, March 18, 1930.

The "costly plant" to which Sir Robert Hadfield refers consists of the specialised plant required for making small arms, machine guns, small arms ammunition, artillery of all calibres, gun mountings, for turning shells, for filling shells, for making armour plate, etc. At the moment it also includes the machinery required for making military aircraft, since the alternative civil market can hardly be said to exist. It applies also to the plant for making many chemical products required for war, since these plants are already, for war reasons, expanded beyond their economic limits and, therefore, *ex hypothesi*, far beyond all possible requirements in peaceful goods. There is not, therefore, a very high proportion of the existing armament plant which can be switched over to making "peaceful" goods.

Moreover, as Sir Robert Hadfield points out, the markets for most "peaceful" products which armament firms can make are already glutted by the production from normal sources.

(d) Private manufacturers are far better able to transfer their plant to peace production when they know definitely that they need not expect any further armament orders in times to come. For even in respect of such plant as can be "switched over" from making war material to the production of "peaceful" objects, the process of transfer is necessarily wasteful. That a complete and final transfer can, however, be successfully effected was proved by Krupp in the years which followed the making of the Treaty of Versailles.

(e) The above points show:

(i) That much of the plant in private armament factories cannot be adapted to peaceful production in times of reduced armament demand;

(ii) That the "switch over" of such plant as can be so adapted is a wasteful process;

(iii) That even if such plant can be switched over there is not always a market for its products.

These propositions have been amply proved by the unfortunate experience of many armament firms during the years which followed the War.

Alternative Work in Government Arsenals.

193. Finally, it is not true that Government arsenals cannot switch over to making "peaceful" products as adequately as private firms. On the contrary, there are many forms of alternative work which could be given to Government establishments in times of reduced armament demand. I venture to refer to:

(i) A report prepared by a Government Committee presided over by the Right Hon. Arthur Henderson, M.P., in the year 1907.* In this report the Committee made a large number of proposals with regard to alternative work which could be done by Ordnance factories in periods when armament demand is slack. They proposed that the Ordnance factories should make many articles required by the Government Departments. Some of these articles used in earlier times to be supplied by the Ordnance Factories, but more recently had been ordered from private firms. Many of them were of such a nature that large stocks could profitably be made in slack times with the certainty that they would be needed in case of war and that they would not become obsolete with the passage of time.

I would draw the attention of the Commission particularly to paragraphs XXVII *et seq.* of the report and to appendices XV, XVI, XVII and XXI:

(ii) A petition presented to the Government by the "All Grades Committee" of Woolwich Arsenal in the year 1919.

In this petition it was proposed, among other suggestions, that the Ordnance factories should be employed to produce railway supplies. Such supplies would no doubt be needed on a large scale by the armed forces, if war should occur again.

* Cd. 3514, 1907.

They also proposed the manufacture by Ordnance factories of other articles (e.g., wagons) of which stocks could economically be built up at times when the demand for armaments proper was slack.

(iii) The McKinnon Wood report, in which it is proposed that the Ordnance factories should be employed to manufacture the articles required for the mechanical transport of the Armed Forces.

193a. It is true that if such a system of alternative work for Government establishments were brought into force, its first effect would be to transfer the hardships caused by the fluctuations of armament demand to those private manufacturers who had previously furnished the non-warlike articles which the Government establishments would in future produce. This transference of hardship from private manufacturers of arms to the private manufacturers of other supplies would be a matter for regret; but once the change over had been made these private firms would adjust themselves to the loss of the Government market and after this first adjustment had been effected, no hardship would be felt.

(f) If, unhappily, no Disarmament Treaty is made—and this is the hypothesis on which the present discussion is based—the staff of the Government establishments could be used in slack periods to prepare the industrial mobilisation of the general engineering resources of the nation for war expansion. Thus:

(i) The design and drawing departments could prepare supplies of specifications, blue prints, and instructions for the engineering firms who will be called into armament production when war begins.

(ii) The skilled workers could be employed in making large reserves of the jigs and gauges which the private engineering firms will require. This, I believe, is already done in the State arsenals of the United States of America and Czechoslovakia. It is the best kind of work on which to employ those highly skilled Government arsenal workers who will be responsible in case of war for helping to carry out the processes of industrial mobilisation.

(iii) The lower grades of managerial staff, the foremen and perhaps also skilled workers, could be sent round the country to private firms to assist in instructing them in time of peace as to the functions they will be called upon to perform when industrial mobilisation has to be carried out.

(iv) The remaining workers could be employed in Government establishments in making reserve supplies of specialised armament machinery and machine-tools which will be required when war breaks out.

I recognise, of course, that these proposals would involve certain expenditure which might be condemned as wasteful. It would at least have the advantage of greatly increasing the efficiency of industrial mobilisation when, if ever, it had to be carried out. Many people object to the prospect of industrial mobilisation; but it would be an inevitable result of war, if war should happen, and its preparation in time of peace is not open to the objections which exist to the system of Private Manufacture.

(h) If the fluctuations in armament demand reach such a point that the armament requirements of the nation could not be met without a very great expansion of the plant which it had been deemed wise to maintain in the Government arsenals in time of peace, the additional output required could be obtained by the adoption of the plan laid before the Commission in the evidence submitted by Mr. Arnold Forster, namely, that plant suitable for armament production should be temporarily leased by the State from private firms. This plan could be applied to the slipways required in constructing ships of war; to factories in which some of the components of gun ammunition could be made; to some of the chemical plant required for the production of explosives, etc.; and to aircraft factories.

By this method the Government would eliminate the motive of private profit from the manufacture of the additional quantities of arms which it required beyond the capacity of its Government factories to provide, and would do so without saddling itself with the maintenance of greater plant than it might desire to maintain in normal times.

Conclusion concerning Fluctuations in Armament Demand.

194. I therefore submit the following conclusions to the Commission:

If conditions of international anarchy continue, and if those conditions produce the same fluctuations in armament demand in the future as they have produced in the past, the community will inevitably suffer loss and inconvenience of many kinds. But:

(a) If the production of arms were made a Government monopoly, the Government would have a keener stimulus to diminish the effects of these fluctuations than they have now.

(b) The Government establishments could be given many kinds of alternative work which could be spread over periods when armament demand was slack and which would not cause undue loss to the Exchequer.

(c) The Government establishments could play a most effective part in preparing the industrial mobilisation which would be required if war occurred.

(d) The loss to the community would fall where it belongs, namely, on the Government, whose policy is, in the last resort, responsible for the fluctuations of armament demand.

The breaking up of expert staffs.

195. It is sometimes said that yet another serious disadvantage would result from the abolition of Private Manufacture, namely, that the expert staffs of designers, managers and workers now in the employ of the private armament firms would be broken up, and their irreplaceable services thus lost to the nation. This, it is said, would be a most serious handicap to the nation if war should ever again break out. (cf. e.g. the statement by Sir R. Hadfield quoted in paragraph 192 above.)

This contention rests on the assumption that the abolition of Private Manufacture will necessarily involve the total unemployment of those now engaged in making armaments in private firms. This assumption is without foundation. The numbers employed in armament production will depend upon the volume of arms to be produced. If no Disarmament Treaty is made and if, therefore, armaments remain at their present level, the Government dockyards, arsenals, and factories would require to employ approximately the same number of people as are now employed in the private armament firms. Thus:

(a) The managerial staff of private armament factories would either be kept on as State servants in their present factories, if these were nationalised, or would be given preferential treatment in the recruiting of the additional staff which the expanded Government establishments would require.

(b) The designers now attached to private firms would either be kept at their present posts in Government employ, or would be transferred to the Drawing Office at Woolwich Arsenal, or to the Royal Corps of Naval Constructors and Aeronautical Designers.

(c) Foremen and skilled workers would almost certainly be taken into Government employ, especially if the Government adopted the plan described in paragraph 193a above for the preparation in times of peace of reserve stocks of jigs, gauges, etc., for industrial mobilisation.

196. The numbers of skilled armament managerial staff, designers and workers in the country will therefore be approximately the same whether they are employed in private or in Government establishments. But it may well be contended (cf. paragraphs 143 and 144 above) that their concentration in Government employ would greatly increase their effectiveness as a cadre for organising the expansion of armament production when war occurs.

The difficulty alleged to result from the fact that great numbers of articles required for Combatant use by the Armed Forces are not at present made by Government Arsenals and Ordnance Factories.

197. This difficulty has in some measure been dealt with in the argument presented in the chapter devoted to the subject of "definition." It was there suggested:

(a) That many important articles not now made by Arsenals, e.g., armour-plate, tanks, aircraft, marine engines, would certainly have to be made in Government establishments when Private Manufacture had been abolished.

(b) That many of the smaller articles now purchased from private manufacturers, e.g., optical

glass, magnetos, etc., could still be obtained from private factories without seriously obstructing the fulfilment of the purpose for which the abolition of Private Manufacture is desired.

(c) That the adoption of the principles proposed in the section on "definition" (paragraphs 161 *et seq.* above) in respect of component parts would cover the vast majority of all articles now purchased by the Government from private firms.

(d) That there would be no difficulty in making in Government factories the component parts which would fall within the definitions there suggested. At the end of the War Woolwich Arsenal was well described as a "University of Arms," turning out virtually everything needed for arms of all descriptions.

CHAPTER XVII

Summary of Conclusions

198. As the result of the considerations set forth in the preceding sections, I venture to submit the following conclusions for the consideration of the Commission:

(1) The present system of Private Manufacture involves evils which are officially admitted to exist, and which it is desirable in the public interest to remove.

(2) The alleged advantages of the system of Private Manufacture are far less important than is generally supposed.

(3) In particular, it is a fallacy to believe that the existence of a private armament industry would facilitate the expansion of armament production in time of war.

On this, as on other technical points which are urged in favour of the present system, the balance of advantage would appear in fact to lie with the system of Government monopoly.

(4) The alleged technical difficulties of abolishing Private Manufacture and establishing a system of Government monopoly are much less than is often believed. There is no problem involved in the establishment of a Government monopoly for which a practical solution cannot quite easily be found.

(5) The most satisfactory method of removing the evils due to the existing system would be by the complete abolition of Private Manufacture. I venture respectfully to submit that the Royal Commission would most adequately discharge its task by recommending to His Majesty's Government that this abolition of Private Manufacture should be carried through, if necessary by Great Britain acting alone.

(6) It would, however, be desirable in the national interest that Private Manufacture should be abolished not only in Great Britain, but throughout the world. For so long as the private vested interest in armaments continues to exist elsewhere, there will remain the danger that its influence will succeed in obstructing disarmament or in raising the existing level of national armed strength in other countries and that it will thus impose a consequential increase in armament expenditure upon the British people. His Majesty's Government should therefore propose general abolition by international agreement.

(7) Whether or not Private Manufacture is abolished, it is desirable that national and international measures should be taken to control the trade in arms. These measures should include:

(a) The adoption of an international system of licensing and inspection, similar to that recently proposed by the United States Government, and including:

(i) The Government licensing of armament manufacture (if Private Manufacture is permitted at all).

(ii) The special licensing of all exports or imports of arms.

(iii) The fullest publicity for all armament orders before they are executed.

(iv) The control and inspection of all licences and of the books and factories of Private Armament Firms (if permitted to exist) by international commissions established by the League of Nations.

(8) These measures for dealing with the trade in arms should be linked to, and indeed founded upon, the provisions of the Covenant and the Pact of Paris for the Renunciation of War. In pursuance of the obligations of these Treaties, His Majesty's Government should make it a binding rule of their foreign policy to allow no export of arms:

(a) To any State which is a party to an international dispute under consideration by an international tribunal.

(b) To any State which has resorted to war in violation of its international engagements.

(9) His Majesty's Government should endeavour to secure the acceptance of this principle by the other Members of the League.

(10) If Private Manufacture is not abolished, then as an alternative the following measures should be taken:

(a) "Public Utility" control over private firms to limit the prices or profits;

(b) The establishment of a National Arms Board with a monopoly of the home and foreign marketing of arms.

(11) In pursuance of the obligations of Article 8 of the Covenant, His Majesty's Government should endeavour to secure international acceptance for a system of the fullest possible publicity for all the processes of armament manufacture and of the trade in arms.

ANNEXES

ANNEX A VICKERS GROUP.

Vickers, Ltd., is now a holding company and its only fixed assets are investments in other companies. It owns all shares of the following subsidiary companies:—

1. Airship Guarantee Co., Ltd.
2. Electric Holdings, Ltd.
3. Cooke Troughton & Simms, Ltd.
4. Vickers Train Lighting Co., Ltd.
5. Robert Boby, Ltd.

6. Manufacturers Estates and Assets Co.
7. Vickers (Aviation), Ltd., owning:—
Supermarine Aviation Works (Vickers).
8. 99 per cent. of Ioco Rubber and Waterproofing Co., Ltd.

Vickers, Ltd., has substantial holdings in Italian and Roumanian companies.

Since July, 1935, when Vickers, Ltd., bought the shares held by the Armstrong-Whitworth Group, Vickers, Ltd., owns practically all shares in Vickers-Armstrong, Ltd.

This company controls:—

Whitehead Torpedo Co., Ltd.
Vickers (Ireland), Ltd.
Thames Ammunition Works, Ltd.
Placencia de las Armas Co., Ltd.
Variable Speed Gear Ltd.

Vickers-Armstrong also has a large holding in a foreign company.

By the terms of its articles, Vickers-Armstrong is not bound to publish any list or particulars of the securities or investments held by the company, or to give any information concerning same to any shareholder, unless instructed to do so by an Extraordinary Resolution in General Meeting, but in January, 1923, it is known that Vickers-Armstrong bought from Vickers, Ltd., all shares and interests in the following companies:—

Kabushiki Kwaisha Nihon Seikoshō (Japan Steel Works).
S.A. Le Nickel.
Steel Manufacturers Nickel Syndicate, Ltd.
High Speed Steel Alloys.
High Speed Steel Alloys Mining Association.
Société des Etablissements Minière de Starachowice.

Micell Bearings, Ltd. (share capital only).
Electrode Company of Sheffield, Ltd.
Usinele Metalurgice din Copșa, Mica și Cugir.
Experiencias Industriales S.A.

Vickers-Armstrong also bought from Vickers, Ltd., all its benefits from and arrangements with:—

Sociedad Española.
S.A. Acieres et Domaines de Resita.
Kabushiki Kwaisha.
Vickers Schneider.
Terni Company.

Similarly, Vickers-Armstrong bought from Armstrong-Whitworth Group shares and interest in:—

Kabushiki Kwaisha.
High Speed Steel Alloys.
Thames Ammunition Works.
S.A. Le Nickel.
Steel Manufacturers Nickel Syndicate, Ltd.
High Speed Steel Alloys Mining Association.
Sociedad Española de Construcción Naval.

Vickers, Ltd., Vickers-Armstrong, and Cammell Laird own between them practically all the shares of The English Steel Corporation.

This company controls:—

Taylor Brothers & Co., Ltd.
Darlington Forge, Ltd.
English Steel Corporation (Australia Prop.), Ltd.
Industrial Steels, Ltd.

Vickers, Ltd., and Cammell Laird together own a controlling interest in:—

Metro-Cammell Carriage Wagon and Finance Co., Ltd.,

which company incorporates and includes five other companies and controls four other companies:—

Cammell Laird owns Tranmere Development Co., Ltd.,

and holds a large number of shares in

English Electric Co., Ltd., which owns:—

Dick Kerr Works.
Ordnance Works, Coventry.
Phoenix Works.
Siemens Works, Stafford,
and controls:—
Willan & Robinson.

(Reference for above list:—

Somerset House and Stock Exchange Year Book, 1935.)

E. I. DU PONT DE NEMOURS & COMPANY.

Subsidiary Companies wholly owned by Du

Pont:—

1. American Glycerin Co.
2. Associated Securities of Canada Ltd.
3. Du Pont Building Corporation.
4. Du Pont Cellophane Co., Inc.
5. Du Pont S.A.
6. Du Pont Rayon Co.
7. Du Pont Securities Co.
8. Du Pont Viscoid Co.
9. The Pacific R. & H. Chemicals Corp.
10. The Grasselli Chemical Co.
11. Hotel Du Pont Co.
12. International Freight Corp., Inc.
13. National Ammonia Co., Inc.
14. Rokeby Realty Co.
15. Perth Amboy Chemical Works.

Subsidiary Companies not wholly owned:—

22. Mouldrite Company, Ltd.

Through I.C.I. (Fertilisers):—

23. Casebourne & Co. (1926), Ltd.

Through I.C.I. (Metals) Ltd.:—

24. British Copper Manu. Ltd.
25. Allen Everitt & Sons, Ltd.
26. Elliotts Metal Co., Ltd.
27. John Marston Ltd.

28. Excelsior Motor Radiator Co.

29. Lightning Fasteners Ltd.

Through Broughton Copper Co.:—

30. John Bibby, Sons & Co. (Garston), Ltd.

31. Welsbach Light Co., Ltd.

32. Stealite & Porcelain Products, Ltd.

33. Paper Goods Manufacturing Co.

34. I.C.I. of Australia and New Zealand.

35. Finance Company of Great Britain and America.

Imperial Chemical Industries, Ltd., has preponderating interest in the following companies:—

1. African Explosives & Industries, Ltd. (I.C.I., 50 per cent., De Beers Consolidated Mines, Ltd., 50 per cent.).

This company controls:—

Cape Explosives Works, Ltd.

2. Scottish Agricultural Industries, Ltd. (£551,443 out of £822,226 ordinary shares).

This company controls:—

Charles Tennant & Co. of Carnoustie Ltd.

Aberdeen Commercial Co., Ltd.

Barclay Ross Hutchison Ltd.

Alexander Cross & Sons Ltd.

Cross's Chemical Co., Ltd.

J. & J. Cunningham Ltd.

John Miller & Co. (Aberdeen), Ltd.

Daniell Wylie & Co., Ltd.

3. Amal, Ltd. (formerly Amalgamated Carburetors Ltd.).

4. F. Crane Chemical Company, Ltd.

5. Nobel Chemical Finishes Ltd.

6. Naylor Brothers (London) Ltd. (paint and varnish).

7. Portland Glass Company, Ltd.

Imperial Chemical Industries Ltd. has established following selling companies:—

Brunner Mond & Co. (Japan), Ltd.

Imperial Chemical Ind. (China) Ltd.

Imperial Chemical Ind. (Levant) Ltd.

Imperial Chemical Ind. (India) Ltd.

Imperial Chemical Ind. (Peru) Ltd.

Imperial Chemical Ind. (Malaya) Ltd.

I.C.I. (Argentine) Ltd.

Cia Imp. de Industrias Quimicas de Chili.

Cia Imp. de Industrias Quimicas de Brasil.

Imperial Chemical Industries Ltd. is associated with the following companies:—

Cartoucherie Orbea Argentina.

Cia Sud-Americana de Explosivos.

S.A. Industrial y Comercial Rivadavia.

Imperial Chemical Industries Ltd., jointly with E.I. Du Pont de Nemours, is directly interested in the following associate company, with which they have an agreement for exchange of inventions which gives the associate Company exclusive production and selling rights of all inventions in Canada; Du Pont exclusive rights in U.S.A., Mexico, Central America and West Indies; and I.C.I. the exclusive rights within the British Empire, and gives I.C.I. and Du Pont the rights within any and all other countries:—

Canadian Industries Ltd.

which Company owns:—

Arlington Co. of Canada Ltd.

Canadian Ammonia Co., Ltd.

Canadian Explosives Co., Ltd.

Canadian Fabrikoid Ltd.

Canadian Salt Co., Ltd.

Dominion Cartridge Co., Ltd.

Flint Paint & Varnish Co., Ltd.

Grasselli Chemical Co., Ltd.

Triangle Chemical Co., Ltd.

and controls Canadian Safety Fuse Co., Ltd.

Imperial Chemical Industries Ltd. has investments in and trade connections with the following Companies:—

E.I. Du Pont de Nemours and Co. of U.S.A.
I.G. Farbenindustrie of Germany.
International Nickel Co. of Canada.
General Motors Corporation of U.S.A.
Allied Chemical Co. of U.S.A.

(Compiled from Stock Exchange Year Book, 1935, and Moody's Statistics, 1935.)

ANNEX B LEAGUE OF NATIONS.

Conf. D./C.G. 48.
Geneva, 3rd March, 1933.

CONFERENCE FOR THE REDUCTION AND LIMITATION OF ARMAMENTS.

COMMITTEE FOR THE REGULATION OF TRADE IN AND PRIVATE AND STATE MANUFACTURE OF ARMS AND IMPLEMENTS OF WAR.

Question of the abolition of private manufacture of arms.

The Danish, French, Polish and Spanish Delegations submit the following considerations:—

1. Article 8, paragraph 5, of the Covenant of the League of Nations draws the attention of Members of the League to the dangers inherent in the private manufacture of arms:—

"The Members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those Members of the League which are not able to manufacture the munitions and implements of war necessary for their safety."

For Members of the League, the solution of this problem must therefore be of an international character.

Everywhere the private manufacture of arms and ammunition, like all other private economic activities, aims primarily at a profitable return upon the invested capital. There must therefore be a constant increase in the demand for arms, which can only be maintained in an atmosphere of strained international relations.

For examples of the evil effects of such enterprises reference may be made to the Report of the Temporary Mixed Commission of 15th September, 1921:—

"Armament firms have attempted to bribe Government officials both at home and abroad.

"Armament firms have disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armament expenditure.

"Armament firms have sought to influence public opinion through the control of newspapers in their own and foreign countries.

"Armament firms have organised international armament rings through which the armament race has been accentuated by playing off one country against another.

"Armament firms have organised international armament trusts which have increased the price of armaments sold to Governments."

The situation has not improved since 1921. Without mentioning well-known events which occurred in connection with the 1927 Geneva Naval Conference, we may quote the Latvian Government's reply to the enquiry organised in 1926 by the League of Nations. The Latvian Government's statement was as follows:—

"The Latvian Government, however, thinks it desirable to indicate certain concrete examples drawn from its own experience:—

"(a) Cases have occurred in which private armaments firms endeavour to induce Governments to purchase war material by encouraging competition between neighbouring States;

"(b) After selling out-of-date armaments on the strength of dishonest advertisement, such firms offer to supply improved armaments, in this way inducing Governments to accumulate unnecessary stocks;

"(c) As a result of concerted action on the part of armaments firms, prices are unduly high, especially if, as is the case in Latvia, supplies are bought in small quantities."

The international character of any solution of the problem of private manufacture is further confirmed by the fact that the present Conference is proceeding to a limitation and reduction of existing armaments. As soon as States cease to be completely free to develop their existing armaments at their own discretion the question of how the armaments limited by the Convention are to be renewed can no longer be regarded as a purely domestic matter. As armaments can only be renewed by home production or by imports, the two questions of private and State manufacture and traffic in arms take on an international character and must be dealt with within the framework of a single Convention on the same footing and in the same fashion as the problem of the limitation and reduction of armaments.

2. The abolition of the system of private manufacture would not necessarily entail the closing down of all private factories as has been suggested. In so far as their production corresponded to the requirements of the States as limited by the Disarmament Convention, such factories might remain in operation. What would be changed is the system of ownership, which would cease to be private. If repercussions upon the organisation of national industry are inevitable, they would be the result not of the abolition of private manufacture but of the reduction of armaments.

3. The fear of the non-producing States that the abolition of the private manufacture of arms would be detrimental to their interests is unjustified, as even in the present state of affairs arms are only consigned by a private factory with the assent of the Government on whose territory that factory is situated.

At the present time the control over all exports of arms and munitions from their territory exercised by producing States in the sole interests of their national policy leads to the result that the non-producing States derive no benefits from the system of private manufacture. The abolition of this system would not, therefore, modify the situation of non-producing States in any respect.

There is already a tendency among non-producing States to create arms factories on their own territory with a view to making themselves independent of foreign countries in respect of the organisation of their national defence. This policy has nothing to do with the problem of the abolition of private manufacture, as from the point of view of a non-producing State, it is immaterial whether it is dependent in time of peace upon supplies obtained from the factories of a foreign State or upon supplies from factories which, though private, are in practice under the control of a foreign State.

4. Under The Hague Convention, belligerent States are only entitled to obtain new stocks from neutral private manufacturers and are prevented from procuring them from neutral State enterprises. From that it has been inferred that the abolition of private manufacture would prevent non-producing States from obtaining fresh supplies in time of war.

The problem of neutrality cannot, however, be considered solely in the light of The Hague Conventions irrespective of the other international agreements, more especially the Covenant of the League and the Pact of Paris, which have profoundly altered the legal and moral aspects of this problem. Can States bound by the Covenant of the League or the Pact of Paris use their neutrality as a pretext for treating a State which has resorted to war contrary to the afore-mentioned instruments and a State victim of an aggression on a footing of equality?

The abolition of private manufacture would make it possible to avoid cases in which Governments, while co-operating with international organisations for the pacific settlement of a dispute, would be exposed, in the absence of international regulation, to pressure from some of their nationals engaged in the private manufacture of arms. By claiming the right to sell arms and munitions to one and, sometimes to both, of the parties to the dispute on the ground that their foreign competitors will do so if they refrain, such private manufacturers would help to defeat international efforts for the pacific settlement of the dispute.

The contradiction would be even more striking if for the same private reasons the nationals of States bound by the Covenant of the League or the Pact of Paris were, in contravention of these instruments, to furnish arms and munitions to a State resorting to force in violation of international law.

5. The fear expressed in certain quarters that non-producing States would constitute considerable stocks of arms with a view to making themselves independent of foreign imports in case of war would appear to be exaggerated. Whatever the extent of the limitation of material under the terms of the Convention, no State—not excluding non-producing States—will be able to constitute stocks in excess of the direct or indirect limits fixed in respect of each of them under the Convention.

6. It has been noted on occasion that in certain countries it would be more difficult for Governments to reduce their arms factories on the cessation of hostilities than for private factories, owing to the pressure brought to bear in Parliament by representatives of workers employed in the manufacture of armaments.

It is not for the Disarmament Conference to concern itself with what may happen on the cessation of hostilities, that is, after a war is over. Its purpose is rather to prevent any outbreak of war.

Moreover, so far as is known, it is not the representatives of the workers who, in their respective countries, bring pressure to bear on the public authorities with a view to preventing the abolition or reduction of arms manufacture.

7. The abolition of private manufacture and the concentration of the manufacture of arms in the hands of the State would establish a more clearly defined distinction between war production and peace production; this is highly desirable since in view of the fact that many industrial undertakings manufacture both arms and other products, there is a risk of the clandestine manufacture of war material in spite of the existence of strict international supervision.

Furthermore, a clear distinction between peacetime and war-time production would render much more difficult the peace-time adaptation of private factories working mainly for pacific requirements to military use in case of war. The potential of industrial countries, without being abolished, might, however, not be utilised for war until after a certain process of adaptation, which would begin only after the opening of hostilities. The private manufacture of arms, by reason of its mixed character, enables industrial States to prepare well in advance in peace time for the immediate utilisation of factories for military purposes.

8. It was observed that it would be difficult to define war industries; that difficulty, however, is not peculiar to the problem of the abolition of private manufacture, but recurs also in connection with the regulation of such manufacture. The difficulty is less serious in reality than in appearance, since the point is not to suppress the private manufacture of all products capable of being used for purposes of war (e.g., chemical products), but only those which are obviously designed for military purposes (e.g., rifles, machine guns, guns), the sale of which has often produced "evil effects." This distinction might be exactly defined as a result of a study which has not yet been undertaken by the Committee.

9. The abolition of arms manufacture is not designed to concentrate in the hands of the State all manufacture that might serve to produce arms. The sole object is to reserve to the State that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes and destines it exclusively for military use.

10. The abolition of private manufacture and the substitution of some other system may, no doubt, involve financial burdens for the producing States. But certain countries, it should be noted, are at present re-organising their affairs in the opposite direction, i.e., they are attempting to reduce their State production by encouraging the development of the private war industry. This transformation, which is proceeding with the assistance of direct or indirect subsidies to private manufacturers, undoubtedly involves expenditure no less considerable than would be involved by the substitution of another system for private manufacture. Further, any expenditure arising out of the abolition of private manufacture could be distributed over a period of several years without constituting any very considerable burden on the annual budgets of the States.

11. The national laws now in force are not such as to prevent the evil effects of an international character which are brought about by private manufacture. These laws aim at ensuring the internal security of the State and take into account only the internal repercussions of private manufacture. They do not place at the disposal of Governments, exempt from any international undertaking in the matter, the means necessary to prevent the evil international effects of private manufacture.

12. The interests of private manufacture encourage differentiation and an increase in the power of the weapons produced, a state of affairs which is not in keeping with the spirit of the Disarmament Convention; the aims should be rather to encourage the standardisation of armaments with a view to making them more readily comparable.

13. To sum up, since the "evil effects" on armaments and on peace cannot be done away with by the solutions proposed by those who are in favour of the maintenance of private manufacture (publicity of licences for manufacture and export), the abolition of private manufacture must be envisaged irrespective of any social or political preoccupations, simply to meet the requirements of the Convention for the Reduction and Limitation of Armaments.

ANNEX C

EXTRACT FROM THE INTER-ALLIED NOTE SENT TO GERMANY, AS REPORTED IN "LE TEMPS," JUNE 7, 1925.

"Partie III.

Liste détaillée des redressements nécessaires pour que les clauses militaires du traité de Versailles puissent être considérées comme remplies d'une manière satisfaisante.

II. Usines, Dépôts, Ateliers (Articles 168 et 169).

Usines privées autre que les usines autorisées.

Situation actuelle.

Deutsche Waffen et Munitions Fabrik à Carlsruhe, cartoucherie, 526 machines restent à disperser.

Mausser, à Oberndorf, 885 machines restent à disperser.

Deutsche Waffen et Munitions Fabrik à Wittenau, 1,363 machines restent à disperser (y compris 197 qui ont été changées d'ateliers).

Bayerische Sprengstoff A.G. à Thansau, 4 appareils de nitration non utilisés et une installation de cristallisations sont à démonter et à vendre.

Sachsische Gusstahl-Fabrik, à Dehlen Deuben (Saxe), 3 jeux de presses doubles ont été réinstallés et 2 presses horizontales ont été acquises, malgré l'interdiction formulée.

Pulverfabrik Walsroden, à Demitz, 11 bâtiments étuves à vide restent à détruire.

Usines autorisées.

... Krupp à Essen et Hoppen sont encore à détruire . . . un stock de munitions . . . atelier de Nehr kros de Desching (autorisée) 17 magasins à munitions sont à détruire . . ."

ANNEX D

GERMAN LAW ON WAR MATERIAL (OF 27TH JULY, 1927).

The Reichstag has passed the following Law, which is hereby promulgated with the approval of the Federal Council:—

Section 1.

The import and export of war material of every kind (weapons, ammunition and other material) and its manufacture for export is forbidden.

Section 2.

War material must neither be manufactured, stored nor sold for home use.

Section 3.

The stipulations of Sections 1 and 2, in so far as Section 7 does not otherwise provide, apply to the following articles:—

1. Guns and "Minenwerfer" of every type, their travelling carriages, gun carriages and other special accessories.

2. Projectiles and ammunition for weapons mentioned in 1.

3.—(a) Mechanised weapons (Maschinenwaffen) of every type and all calibres and their gun carriages.

(b) Means of transport and special accessories for these weapons.

4. Rifles, short rifles and carbines of all patterns which:

(a) enter or may in future enter into the armament of the armed forces of any State, or

(b) are adapted for the use of ammunition employed by the German armed forces, or

(c) no longer enter into the armament of the armed forces of any State, but are nevertheless capable of military use or are intended for war purposes.

5. Projectiles and ammunition for the weapons mentioned in 3a and 4.

6. Pistols and revolvers, automatic or with automatic loading contrivances, with barrel length exceeding 9.8 cm. or calibre exceeding 8 mm.

7. Contrivances and machines—intended for war purposes—for firing or ejecting bombs, torpedoes, depth charges and other types of projectile.

8. Hand and rifle grenades and trench mortar bombs.

9.—(a) Land mines.

(b) Bombs intended for war purposes.

10. Torpedo tubes and mechanical devices belonging to torpedo-ejecting mechanisms.

11.—(a) Torpedo ejection charges.

(b) Torpedoes and their special accessories.

12. Depth charges, towed bursting charges, floating mines and moorable submarine mines.

13. Ammunition boxes and packing cases specially adapted for the transport and storage of war material.

14. Submarines, their periscopes and other special equipment.

15. Mountings and mechanical devices for naval guns.

16. Ammunition supply and loading contrivances for naval guns.

17. Mechanical and electrical firing devices for naval guns and torpedoes.

18. Contrivances for controlling the discharge of torpedoes.

19. Fixed or mobile under water protective netting.

20. Armour plates, cupolas and protective shields.

21. Tanks and armoured motor vehicles.

22.—(a) Lances and adjustable bayonets.

(b) Swords intended for war purposes.

23.—(a) Ships of every type and tonnage obviously built or equipped for use as warships or submarine vessels of any kind. Mercantile surface vessels of every type and speed are not included in this category provided they are not equipped in time of peace with special installations which obviously facilitate the use of weapons (guns, mines, aeroplanes, etc.). The reinforcement of decks is permitted in time of peace, but only in the case of mercantile vessels which are built, rebuilt or refitted in Germany on foreign order or account and are intended for export as soon as completed.

(b) Boilers and main engines of all designs, which obviously are specially adapted for use in warships or submarines of any type; specially adapted auxiliary machinery obviously intended for use with such boilers and main engines.

24. Contrivances for projecting or emitting gas or smoke, intended for war purposes; and flame-throwers.

25.—(a) Contrivances for direction and control of fire.

(b) Aiming and sighting devices and range finders intended for war purposes.

26.—(a) Optical instruments and apparatus for ranging by sound or by flash, intended for war purposes.

(b) Searchlights intended for war purposes.

27. Transmitting and receiving installations and contrivances intended for war purposes, also all other apparatus intended for the same purpose, by means of which messages can be transmitted, received or intercepted, or military and naval units controlled.

28. Smoke balls, signal rockets, light rockets, and signal throwers, intended for war purposes.

29. Articles intended for war purposes, which form part of individual or collective military equipment, including steel helmets and gas masks.

30. Entrenching tools specially adapted for war purposes.

31. Barbed wire, including supports and other protective equipment, specially adapted for war purposes.

32. Automobiles and trailers or side cars specially adapted for war purposes.

33. Horse-drawn vehicles specially adapted for war purposes.

34. Observation wagons and observation ladders intended for war purposes.

35. Special devices for bridging columns and their pontoons, intended for war purposes.

36. Field kitchens, motor or horse drawn, and their special equipment, intended for war purposes.

37. Railway rolling stock, specially adapted for war purposes, special accessories therefor and special contrivances for the conversion of ordinary rolling stock for war purposes.

38. All devices employed in the training of men in any matter concerning: artillery, the use of torpedoes and depth charges, the laying of submarine mines, the control of artillery fire and torpedo fire, and methods of attack, as well as the use of range-finders, searchlights, wireless installations and installations for submarine signalling, intended for war purposes.

39. Principal parts of:

(a) the articles mentioned in Nos. 1 to 10, 12, 13, 17 to 20 and 22a and of the gas masks mentioned in No. 29.

(b) the articles mentioned in Nos. 11, 14 to 16, 21, 23b, 25a, 32 and 33 and such articles mentioned in Nos. 25b and 26a as are specially adapted for war purposes, in so far as these principal parts cannot normally be used in the same form for industrial purposes.

40.—(a) Partly finished principal parts, in conformity with No. 39, of the articles mentioned in Nos. 1 to 3, 7 to 12, 15, 16, 20 and 21, if they are obviously intended for the manufacture of weapons, ammunition and war material, or have reached such a stage of manufacture that they can normally be further used for war purposes alone.

(b) Partly finished principal parts of the articles mentioned in No. 4, if they have reached such a stage of manufacture that they can normally be further used for war purposes alone, and of the articles mentioned in No. 5, if they have undergone more than one cold drawing.

41. Asphyxiating, toxic or similar products intended for war purposes; contrivances specially intended for their manufacture, storage or use.

42. Nitro cellulose and nitroglycerine powders:—

(a) Powder for artillery of every kind;

(b) Powder for small arms if obviously intended for war purposes.

43. The following explosives which may form part of any weapon of war:—

(a) Nitro-compounds with three or more nitro or nitric acid ester groups attached to one nucleus, except picric acid and trinitrotoluol.

(b) Compressed or molten picric acid.

(c) Picric acid in powder form intended for war purposes.

(d) Trinitrotoluol, recrystallised or having a melting point over 79 degrees, or in the form of compressed or cast charges.

(e) Trinitrotoluol in powder form intended for war purposes.

(f) Mixtures of ammonium nitrate and nitro-derivatives with more than 25 per cent. nitro-derivatives.

(g) Fusible mixtures of nitro-derivatives and chlorates or perchlorates with more than 35 per cent. nitro-derivatives.

44. Compressed nitro-cellulose in charges for war purposes; nitro-cellulose obviously intended for war purposes; raw materials (Rohmasse) (compositions of nitro-glycerine and nitro-cellulose) intended for war purposes.

45. Detonators and means of ignition, if obviously intended for weapons of war.

Section 4.

The following products are also subject to the stipulations of Section 2:—

1. Small arms intended for war purposes, if not already included under Section 3, No. 4.

2. Ammunition for weapons mentioned in Section 3, No. 6.

3. Boilers and main engines of all designs, which are obviously intended for warships or submarines of any type, and auxiliary machinery obviously intended for such boilers and main engines and their principal parts, if not already included under Section 3, Nos. 23b or 39b.

4. Horse drawn vehicles and their principal parts, intended for war purposes, if not already included under Section 3, Nos. 33 or 39b.

5. Principal parts and semi-manufactured parts, intended for war purposes, of the articles enumerated in Section 3, Nos. 1 to 38, if not already included in Section 3, Nos. 39 and 40.

6. Uniforms intended for war purposes.

7. Harness for draught, saddle, or pack animals, intended for war purposes, and principal parts thereof.

8.—(a) Special war machines; tools, gauges, moulds, models, matrices (sections), stamps, top and bottom swages, specially adapted for the production of war material.

(b) Groups of machinery with connecting mechanism appertaining thereto, specially assembled for the production of war material.

Section 5.

1. The import of the articles enumerated in Section 4 is forbidden.

2. For export, these articles may only be manufactured and stored in the quantities customarily required by trade for the conduct of a regular export business.

3. The articles enumerated in Section 4, Nos. 3, 7 and 8, may only be manufactured for export for the purpose of executing genuine orders.

4. Factories which obtain orders for the export of articles designated in Section 4, No. 8—as well as all other factories—are forbidden to carry out research concerning the production of war material, or to maintain special equipment for such research. Factories which receive such orders for export may, however, carry on the research necessary for the execution of these orders, in so far as this research does not relate to the manufacture of war material forbidden to the German armed forces by the Treaty of Versailles.

Section 6.

1. The stipulations of Section 2 and of Section 5, para. 4, are not applicable to orders given by German official departments.

2. The Federal Minister for Commerce, in collaboration with the Federal Minister for Defence, has the right to limit in the authorised factories the plant for producing the articles mentioned in Section 3, Nos. 1, 2, 3a, 4a, 5, 6, 8, 11a, 15, 16, 20, 33, 42 and 43a to e.

Section 7.

Recrystallised trinitrotoluol, hexanitro-diphenylamine, tetryl and trinitroresorcin may be manufactured for the production of detonators for industrial purposes and exported in quantities fixed yearly by the Federal Minister for Commerce.

Section 8.

Nitrocellulose and nitroglycerine powders, nitro-compounds with three or more nitro or nitric acid ester groups attached to one nucleus and phosphene may only be manufactured in factories which have been granted permission to that effect by the Federal Minister for Commerce. Permission may be granted on condition that only a fixed quantity of apparatus shall be used for manufacture. Permission may be cancelled if the stipulated conditions are not fulfilled, or if the manufacture of the products in question is discontinued for a period of over six months.

Section 9.

1. Any person contravening the provisions of this Law shall be punished by imprisonment not exceeding six months or by detention (Haft) or fine.

2. In addition to the penalty, it may be ordained that the articles, to which the punishable action relates, shall be confiscated and rendered unserviceable, even if they are not the property of either the offender or an accomplice.

3. Confiscation and rendering unserviceable must be ordained if the following are in question:—

(1) Articles mentioned in Section 3, Nos. 1 to 22a, 23 to 25a, 28, 32, 33, 42a, 43b, d, f, g and Section 4, No. 8a.

(2) Articles mentioned in Section 3, Nos. 25b and 26, if specially adapted for war purposes.

(3) Principal parts mentioned in Section 3, No. 39.

(4) Partly finished principal parts, in conformity with Section 3, No. 39, of the articles mentioned in Section 3, Nos. 1 to 5, 7 to 12, 15, 16, 20 and 21, if they have reached such a stage of manufacture that they can normally be further used for war purposes alone.

4. Groups of machinery specially assembled for the production of war material must be dispersed and the connecting mechanism confiscated and rendered unserviceable.

Section 10.

For the period of six months after this Law comes into force its stipulations are not applicable to contracts relating to the export of articles whose export was not prohibited by the Law of 26th June, 1921, relating to the Import and Export of War Material. This holds good, however, only in respect of contracts, concluded before the date of promulgation of this Law, the execution of which had already been begun before that date.

Section 11.

The Federal Minister for Commerce may decide that the stipulations of Section 1 shall not be applied to ships of the type designated in Section 3, No. 23a, if their construction was begun at a German shipyard in virtue of a foreign order before 1st August, 1914.

Section 12.

Upon the entry into force of the present Law, the Law of 26th June, 1921, amending the Law of 22nd December, 1920, relating to the Import and Export

of War Material (Reichsgesetzblatt, p. 767) is abrogated.

Section 13.

The present Law comes into force the day following its promulgation.*

Berlin, 27th July, 1927.

The Federal President,

(Sgd.) VON HINDENBURG.

(For the Federal Minister for Foreign Affairs),

The Reichs Minister for Justice,

(Sgd.) HERGT.

(For the Federal Minister for Economic Affairs),

The Federal Minister for Defence,

(Sgd.) GESSLER.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (a) by the United Kingdom alone, (b) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade,

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

ELEVENTH DAY

Thursday, 31st October, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., LL.D., R.R.C.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O., called and examined.

1494. *Chairman*: Sir Reginald, you have prepared a Note of what you desire to say to us. Would it be convenient that you should read this or would you prefer to make a statement?

Sir Reginald Bacon: I think, Sir, if you ask me questions on what I have written, that would perhaps be the better course.

1495. *Chairman*: The only thing is this: The Press want to be informed of what your evidence is, and therefore, unless you see any reason to the contrary—it is quite short—it would be convenient if you read that first.

Sir Reginald Bacon: Certainly.

1496. *Chairman*: And then we may ask questions. I generally let the Press have the record of the witness. I have yours here. You will not mind my reading it?

Sir Reginald Bacon: Certainly not.

1497. *Chairman*: "Admiral Sir Reginald Hugh Spencer Bacon, K.C.B., K.C.V.O., D.S.O.: Director of Naval Ordnance and Torpedoes, 1907-8; retired November, 1909, to take post of Managing Director of the Coventry Ordnance Works, 1910-15; resigned the appointment and gazetted Colonel 2nd Commandant R.M.A., 1915; commanded Heavy Howitzer Brigade R.M.A. with Expeditionary Force in France; commanded the Dover Patrols, 1915-18; Controller Munitions Inventions, January, 1918-April, 1919." Have you a copy of your Note?

Sir Reginald Bacon: I have, Sir. Shall I read it?

1498. *Chairman*: Yes. You have not prepared any separate statement, have you?

Sir Reginald Bacon: I have prepared a separate statement after I saw the evidence of Dr. Addison.

1499. *Chairman*: Would you be prepared to read that—or perhaps both?

Sir Reginald Bacon: It will not take very long. I will run through it.

With regard to the shortage of ammunition at the commencement of the Great War, this was in no way due to difficulty of manufacture and supply. When quick-firing guns were first introduced into the Army and Navy objections were raised, and it was pointed out that in the Navy the limited space available for stowage would prevent enough ammunition being stowed to take advantage of the increased rapidity of fire. In the Army the objection raised was that the horse transport could never keep the guns supplied. The same answer was given in each case, namely, that occasionally a burst of firing was highly desirable, and it was for this reason that quick-firing guns were introduced, it being recognised that ammunition supply would limit the time during which the quick-firing property of the guns would be

available. No attempt was, therefore, made to increase the manufacturing capacity of quick-firing ammunition. It was never anticipated before the War that you would ever have to supply quick-firing ammunition in quantities that would keep up a constant fire. In the Army at the outbreak of the War there was, I believe, only one single motor transport vehicle—that was an ambulance supplied privately to Sir John French—but within a couple of months motor transport came along and the rate of ammunition supply became largely increased, and the original anticipated difficulty of supply was entirely done away with. Hence a shortage of ammunition. After this, trench warfare upset all calculations regarding the amount of ammunition required by an army. Lord Kitchener one day told me—that was in the latter part of 1914—that he had just seen the Quarter-Master General of the French Army, who informed him that, at the Battle of the Marne—which had just been fought—the French had fired away one-half of the total outfit and reserve of their ammunition—a condition that had never been even dimly considered possible. That, I think, has a very great bearing on the statement that has been quoted so often—that the armament firms at the beginning of the War were unable to supply ammunition in sufficient quantities. They could have done so had the necessity been foreseen; there was absolutely no difficulty in supplying a very considerable amount more than had been supplied. Moreover, the reserves that were kept by the Army were limited to what they considered would be the necessities during the beginning of the War.

As regards high-explosive shell: In addition to ammunition shortage generally a special demand for high-explosive shell for field artillery arose early in 1915. Sir John French showed me, about Christmas, 1914, when I was visiting him at St. Omer, a photo he had just received from the French General Staff which showed a barbed-wire entanglement cut by high-explosive shell. The experience of the Boer War decided the ratio of high-explosive shell and shrapnel supplied to the artillery. High explosive had been found to be more or less useless against kopjes, so the supply was fixed at 25 per cent. high explosive and 75 per cent. shrapnel. But as soon as the French brought out their fuse, which burst high explosive a few inches above, instead of under, the ground, and could therefore cut wire entanglements, immediately the cry came for more high explosive, and this type rose at once to be greatly in value over shrapnel. As all manufacture had been based on the 25 per cent. basis there naturally was a shortage. The trade could easily have supplied 100 per cent. high-explosive shell had it been required to do so before the War.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

As regards the general position of pre-war armament manufacture, so far as the Navy was concerned, we had Vickers, Armstrong and Coventry Ordnance, in the trade, and Woolwich manufacturing for the government. Theoretically, Woolwich was supposed to check trade prices, but in practice they could do nothing of the sort, and this for two reasons (1) Woolwich was badly situated for cheap manufacture. They were a sheltered concern and the incentives to cheapen costs were absent. (2) Their overhead expenses—which included depreciation of reserve buildings and machines—made all their manufacturing costs far too high.

As regards those pre-war manufacturing firms, Vickers and Armstrong were able to supply a man-of-war complete to any country that wanted it. The three firms of Cammell Laird, John Brown and Fairfield were not in that position. If they tendered for a man-of-war they had to obtain their armaments from either Vickers or Armstrong, who were their rivals. They therefore started the Coventry Ordnance Works, so as to be able to supply all the armaments required in the Navy for any particular ship and so enable the three firms, Cammell Laird, John Brown and Fairfield, to tender for a battleship complete. That was the sole reason why the Coventry Ordnance Works were started.

While I am on that point I may say that naturally we had to rely very largely on Government orders to keep the concern going, and during the first four years when I was there we incurred a debt of about £600,000. Then we went to Mr. Churchill, who was the First Lord of the Admiralty, and said, "Here we are. Do you want us or do you not? We cannot go on losing money, and unless you give us a reasonable share of the Government orders every year we shall have to close down." The Director of Naval Ordnance and the Controller were rather against us, they did not want the bother of a third firm, but Mr. Churchill—who on all these occasions shows a very statesmanlike spirit—said he could not afford to lose one of the armament firms in the then condition of Europe, and so he gave us sufficient orders to keep us going. In 1913, when our foreign orders—we happened by that time to have got our nose into them—and with the added support we received, we were able to keep the Coventry Works going. 1500. *Chairman*: You are speaking of the Coventry Ordnance Works?

Sir Reginald Bacon: The Coventry Ordnance Works, entirely. Woolwich, speaking as a pre-war Director of Naval Ordnance, was a nuisance to the Admiralty. We were obliged to order a large percentage of our armaments from Woolwich at prices considerably above those at which the trade could supply, and this was a very serious matter when every penny of the Navy vote was urgently required. Woolwich had no work other than armaments to fall back on, and this prevented the establishment being properly balanced.

I may say that the reason why, when I was Director of Naval Ordnance, I was so keen—and so was my predecessor, Lord Jellicoe—on keeping the Coventry Ordnance Works going was that we had an agreement with them that they would not enter into any combination with either Vickers or Armstrong, and therefore we relied on them to check prices. Woolwich was absolutely useless to check prices. We had the Coventry Ordnance Works in this agreement to keep away from the other two firms, and so we were able to get a check on the prices that the other two firms were charging for our ordnance. Vickers and Armstrong were general manufacturers of steel, shipbuilding, etc. I may say that originally all these firms took up armament manufacture to a large extent as an outlet for their steel, because the armaments themselves took a certain amount of steel and the foreign orders for battleships, cruisers, and so on, also took a good deal of surplus steel. That is why they took up armament manufacture. To them government armament orders were of the nature of a flywheel, which gave an output absorbing of a portion of their steel and kept a steady

flow of one special sort of work. I cannot emphasise too much the value to our big firms—Vickers, Armstrong, the shipbuilding firms—of having at that time a more or less standing order annually from the government, within limits. That did act as a flywheel to their establishment. Trade requirements might fluctuate considerably, but they always had a pretty nearly certain quantity of orders for armaments coming in from the government.

But idle machines usually employed for armament manufacture could also be used for commercial work. Coventry was, in fact, rather like Woolwich, except that it had no annual assured share of government orders. That was before 1913; after that we were given an assurance by the Admiralty. It is an axiom of manufacturing finance that, speaking generally, the more work a firm gets the cheaper it should be able to manufacture. The reason is that the greater the output the more can the overhead expenses be spread and therefore the less each job has to carry. The overhead expenses of a firm may be very heavy—especially is this the case with an armament firm—so that volume of work is required in order to turn out the cheapest product. I have to say, speaking generally—because of course, as every manufacturer knows, you arrive at a certain peak of manufacture when you have to put up new shops and new machines. The cost of these causes a check. So for a time this argument does not apply—but, speaking generally, an increase in orders reduces the costs of production.

Woolwich or whatever factory the government might construct cannot well compete with foreign firms for the supply of armaments to other countries. I think that is something with which everybody must agree. You cannot have the British Government going round supplying armaments to other countries. It would cause such a row that, under present conditions and with the prevalent ideas about peace, it would be too much for any government. Hence, if manufacture is confined to a government arsenal the net outcome will be a loss of trade to this country. I would like here to quote figures with regard to the annual amount of armaments supplied to foreign countries. They averaged between £2,000,000 and £3,000,000. These sums would be entirely lost to the country. A rough calculation will show that the amount in wages lost out of a £3,000,000 order would be £1,200,000. £600,000 would go to overhead charges. About 50 per cent. of the labour cost as a rule went to overhead charges. That left £1,200,000 for material. Speaking roughly, the material and labour costs were about equal. That meant that wages for about 10,000 men would be lost annually, and if we take into account that nearly all the material cost boils down in the end to labour charges, then wages for nearly 20,000 men would be lost. That is working it out roughly. As everybody who has any knowledge of finance knows, that money would probably be spent in this country six times over in the course of the year. It would circulate to different trades.

1501. *Sir Thomas Allen*: I would like to get these figures a little clearer. You speak of £3,000,000?

Sir Reginald Bacon: Yes. £3,000,000.

1502. *Sir Thomas Allen*: The figures that you have given us are £600,000 for overhead charges and £1,200,000 for wages and material.

Sir Reginald Bacon: Yes.

1503. *Sir Thomas Allen*: What becomes of the rest of the £3,000,000?

Sir Reginald Bacon: It is £1,200,000 for labour and £1,200,000 for material.

1504. *Sir Thomas Allen*: Thank you.

Sir Reginald Bacon: We used that as a rough calculation. Thinking over things, that is what you generally used to allow. Now, that is a very serious item suddenly to give up in peace time. Before the War our chief rivals in armament supply were Germany first, then France and America, and anything we did not supply was immediately made by

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

Germany. There was not the slightest question if we did not supply a thing that it would not be supplied at all, because if we did not do it, it would immediately go into foreign hands. I shall have a word to say about that later. Constriction of armament supply on our part will merely divert manufacture to other countries, or cause other countries to start armament factories. It will not reduce the demand for armaments.

Another great disadvantage of concentrating manufacture in a single supply factory is that there will be no competition. Absence of competition must inevitably lead to excessive price of manufactured articles, since the incentive to saving cost will be absent, and shop processes will not be submitted to the same rigorous examination as now exists in order to introduce the most economical methods of manufacture. I might say there that when Woolwich was asked to manufacture they always refused to tender. They said, "It is no good our tendering because you have got to pay us what it costs us to manufacture." If you pressed them and said, "For Heaven's sake give us an approximate figure," they would give you an approximate figure, but they said it might or might not be adhered to. They had the whole of the finance of the government behind them. It did not matter twopence to them what a thing cost. There was no incentive to economy at all, speaking broadly; they made a thing, they sent on the bill to the Admiralty and the Admiralty had to pay. You will always get that in a government concern that has not got to show a balance sheet. I was quite convinced—and our prices proved it at the time—that it was cheaper for the private firms to pay a dividend than it was for Woolwich to manufacture, because they had no financial responsibility. There is one other thing I must say, in defence of Woolwich, that their reserve plant ran up their overhead charges excessively.

In no way will the disadvantage of a single factory be more felt than in design. I view with much regret the absorption of the old firm of Armstrong by Messrs. Vickers. This, coupled with the absence of the Coventry Ordnance, must inevitably strike a bad blow at competitive design, and the efficiency of the armaments in future adopted must suffer. If the demise of Vickers is added to this state of things, the result will be catastrophic.

Now, I want particularly to call your attention to this, because it is so true and it is a point that is so little appreciated by people who talk generally on the whole subject. As Director of Naval Ordnance, I always had a haunting dread that when war broke out we might find that our enemies had something up their sleeves better than what we had, and that we should find ourselves at a disadvantage. My only solace was the fact that we had as our independent designers three armament firms and Woolwich, all anxious to have their particular designs adopted. Destroy this, and then if war does occur we may have a very rude awakening. The efficiency of our design of armaments is of incalculable importance—I say that advisedly—and overshadowed, in my mind, every other consideration. Up to the day that war is declared, you never know what the other side have up their sleeves and your only security is to have strong designing departments in competition and—another point I was coming to—your armament firms having relations with other firms, not necessarily armament firms, in Europe, from which they can gather information regarding other countries. I do not refer to spying or anything of that sort, but having relations by which they can gather a lot of information.

You may remember a statement that was made a short time ago about Mr. Mulliner. Mr. Mulliner was a very sharp, clever man, who was managing director of the Coventry Ordnance Works. He happened to go abroad on a business visit and he came back and told me, among other things—

1505. *Chairman*: Just one moment. At that time, were you at Coventry?

Sir Reginald Bacon: No. I was the Director of Naval Ordnance. He was at Coventry. It was at the beginning of 1909. He came back and told me that Krupp had got orders for—I think I am right in saying—four circular planes, particular machines with very big base dimensions. The only use of that machine was for turret manufacture for men-of-war, for planing up the roller paths. What was the inference? That Germany was preparing to manufacture armaments on a very large scale. The other thing I heard was from the late Sir Trevor Dawson—that Krupp was a member of the Nickel Syndicate in Europe and all the members of the Nickel Syndicate were supposed to place their orders for nickel through the Syndicate. Instead of that they heard, and found out, that Krupp had placed a very large order for nickel outside. The only inference to be drawn from that, as nickel was then almost entirely used either for gun or armament manufacture, was that Krupp was laying up secretly a large supply of nickel.

1506. *Sir Philip Gibbs*: Do you happen to know where the nickel came from?

Sir Reginald Bacon: No. I know nothing about that, I am sorry to say.

1507. *Sir Philip Gibbs*: Do you know what country it came from?

Sir Reginald Bacon: I know nothing about it. I am only telling you what Sir Trevor Dawson told me. Naturally, I passed on the information to the First Lord of the Admiralty and the information proved correct. Our inference, which was perfectly correct, was this. It took 18 months at least to make a complete set of turret mountings for a man-of-war. You can build a ship in a year. The original Dreadnought was built ready for sea in that time, but the only reason why it was ready was because we took the turret mountings of two other ships that had been laid down the year before and put them into the Dreadnought. What Germany did was to make mountings in advance of laying down the ships, so that when the moment came to build more ships she had the turret mountings. That is why Krupp was expanding so much in the direction of this special machinery for the manufacture of turrets. I may remark that it was on that information—and other information, of course, that was coming in—that the Government laid down the eight ships in 1909. You may remember there was a tremendous fight and it was entirely through Mr. McKenna and Lord Fisher that the matter was carried through the Cabinet. In fact, Mr. McKenna was out of the Cabinet for 24 hours because of the opposition he met with to this programme. Those eight ships probably saved the country because, in January, 1915, we had only 18 Dreadnoughts fit to fight, compared with the German 16.

1508. *Mr. Spender*: In 1914?

Sir Reginald Bacon: January, 1915. Five months after war was declared we only had a superiority of two Dreadnoughts over the Germans and they had a superiority of six pre-war Dreadnoughts over us. It was running things extremely fine. On paper we had more Dreadnoughts but they had had a collision which laid up two Dreadnoughts and the *Audacious* had been sunk, which rid us of another, and two had been so short a time in commission that they were not in a fit condition to fight. If it had not been for Mr. McKenna and Lord Fisher insisting on those eight ships at that time, in January, 1915, if the Germans had come against us we might very likely have lost command of the sea and lost the War. It was to a certain extent—I will not say entirely—due to information that we were able to obtain about what was happening in Europe through members of private armament firms that caused us to have the right Dreadnought programme. Another point is that a commercial firm has far better opportunity to discover what foreign firms and governments are doing in the way of design and manufacture than any government can have.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

I have the actual figures here. We had 18 efficient Dreadnoughts fit to fight to Germany's 16. We had eight pre-war Dreadnoughts to Germany's 16, we had four battle cruisers to Germany's three, we had 12 light cruisers to Germany's 14, and we had 42 destroyers to Germany's 88, so if you take the figures right through, from start to finish, you will see we were at considerable disadvantage in the Grand Fleet as compared with the High Seas Fleet.

Another point is that a government cannot pay adequate salaries to the best men. To do so would create a demand throughout all departments for pro rata salaries. Hence the government factory will never be able to procure the best brains. That, of course, is obvious. The moment you increase the salary of the superintendent at Woolwich, all the dockyard superintendents want an increase, and the Treasury will not stand that. In a private firm, if you find a really good man you can pay him a good salary.

It is, of course, an utter fallacy to say that an armament firm wants war. It neither wants war, nor does it make any more money during a war than a dozen or more general trading concerns. Stability of exchanges and regular work are the desiderata of any manufacturing firm.

A small country that obtains its armaments from another country is bound to it by very strong ties. That is a point that is not often recognised. To a certain extent the fact that Krupp had supplied the armaments to Turkey made Turkey very anxious to enter the War on the side of Germany. When the question of rearming the Turkish Army came along the German Minister for foreign trade went to Constantinople and refused to leave until he had obtained the contract for his country. I happened to be in Constantinople soon after and found that our Embassy took no interest in our trade. It was not a thing that concerned the Embassy in the slightest. After Commercial Attachés were appointed they really began to help the country in obtaining orders for foreign contracts. Had the Turkish army been armed with English pattern rifles, guns and ammunition the question of on which side Turkey entered the War would probably have received a different solution.

There is another point that I think I ought to mention. I have seen it stated that British ammunition was used against our troops at Gallipoli. That is very likely. Why should it not be? I think at that particular moment the German ammunition was probably a little better than ours, but the main point is that if they had not used English ammunition they would have used German, which would have been to the disadvantage of our troops. The reason I say that the German ammunition was better than ours is that they had better fuses for their shells. They were the leading nation in fuse manufacture at that time. When the Seymour Relief Column in the Boxer Expedition captured the big arsenal outside Tientsin, they had run out of ammunition; and lo and behold, in the arsenal they had any amount of 303 ammunition and that saved the whole Expedition being cut up.

Six weeks before the Great War broke out I asked the War Office to give to the Coventry Ordnance a small order for 2,000 fuses so as to keep my staff and foremen in the fuse factory employed. The War Office refused. I had to discharge all except the manager. Within a day or two of the declaration of war the War Office asked me to turn out 20,000 fuses a week. Their previous refusal delayed the supply for several months longer than would have been the case had I received the order I asked for. I put that in because it is interesting. It shows an absolute want of any idea that we were going to war. You could not have any better evidence that we did not engineer the War, than the fact that the War Office refused to give an order for 2,000 fuses six weeks before the War and yet when the War broke out they wished to place an order for 20,000 a week with one single firm.

Perhaps it might interest the Commission to mention that, when war did break out, I went before the Committee of the Cabinet that was sitting on the supply of armaments. Lord Kitchener was the Chairman. I have never ceased since to marvel at the way Lord Kitchener tried to get my firm to supply more than we could. He was an extremely clever man but he had never been actually engaged with manufacture and he did not seem to appreciate that forecasting manufacture was a mathematical calculation. If you want to manufacture a gun which is going to be made in say 20 different parts, each part requires so many hours' machining on certain machines. If you are going to supply 10 guns, the time you require is that number of hours multiplied by ten. Lord Kitchener wanted me to supply a certain number of 4.5 howitzer equipment. It was a thing we had supplied before. Therefore, the order was given to us. I forget what the number was. It may have been 150. He said "You can do more than that. Surely you can do 200. As a matter of fact, we want 300. Can you not do more?" I said "No. I can only promise to do 150. I will try to give you more if I can, but I cannot promise. I have men in America buying machines and I have to put up new shops and when the machines are installed it will take a little time before I can start extra manufacture. If I can do it, I will, but I cannot promise to supply more." But he still continued to press me.

A great point has been made by Dr. Addison about the failure of firms to fulfil orders about June, 1915. I think that was very largely owing to the pressure that was put upon them to try and give an optimistic estimate. At the same time Lord Kitchener said to me "Vickers have promised so and so". I said "I really do not know what Vickers can do. All I know is what I can do." I added that the government would have to take over the whole of the manufacture of the country. Mr. Lloyd George immediately took up the point, with his usual alertness. He asked "Do you mean that the government will have to take over all the labour?" I said "They will have to do so; they cannot do it now because we have not the machines but the time will come when the government will have to take over the whole of the labour of the country and apportion it among the manufacturing firms." I have never ceased to wonder at the way Lord Kitchener tried to increase the number that we said we could supply.

Armaments are a check on war—a much greater check than the League of Nations. Of course, as you know, we have always been able to stop war at any time between the Crimean War and the Great War by the strength of the Navy. We did it on four or five different occasions and I think public opinion seems to be coming round to the same idea that it is a strong navy in the hands of a first-class power that can preserve peace. Our Navy stopped the Russo-Turkish War, that was in 1877.

1909. *Chairman:* A first class pacific power with pacific ideas, you mean?

Sir Reginald Bacon: You are quite right, Sir. That I claim England to be. At all events, we stopped the Russo-Turkish War by sending a fleet up the Dardanelles; that was in 1877. In 1897 there was the Fashoda business. We stopped that, and for a very peculiar reason. We were very strong then in the Mediterranean, but the French had devoted all the money that had been voted for their naval supplies to rearming their field artillery against Germany. The result was that at the moment they wanted their navy the Minister of Marine said "We really cannot go to war because we have not the naval strength." Then we had the Penjdeh incident. You may remember that. There we had every one of the Russian ships dogged by one of our ships and if war had broken out they would either have had to have hauled down their colours or be sunk. When the Italian-Abyssinian trouble arose one word from us to Italy would have shown that

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

country the impossibility of sending an expeditionary force overseas in the face of the orders given to our fleet to prevent their transport. We only had to say to Italy before the Italian Government committed themselves: "If you send out transports we shall stop them." No country would dare to send troops overseas unless they had command of the seas.

1510. *Chairman*: Thank you, Sir Reginald. That is the end of the Note as supplied to us.

Sir Reginald Bacon: Yes, Sir.

1511. *Chairman*: You had prepared some further Notes.

Sir Reginald Bacon: I have prepared some further Notes. I had little knowledge when I prepared the original remarks of what your Commission was hearing or doing. I read Dr. Addison's evidence and I should like to put before you, Sir, a proposal which I think is much simpler and much less expensive and far more efficient than that which Dr. Addison from his great experience has advocated. That is this. I am absolutely and utterly opposed to a big government manufacturing concern. It is really a practical impossibility—at least from my knowledge of manufacture—for many many reasons which I could give you if you want them. What I think we ought to do is very simple. That is, to have a shadow Ministry of Munitions. When the War ended we had the most efficient—not manufacturing—but ordering department, in the shape of the Ministry of Munitions. Naturally, that was a thing that you could not keep going after the War because a good deal of the work done there was voluntary and also a good deal of the work was done by men taken from their ordinary peace-time employment; but I do not see why you should not have a shadow Ministry somewhat on these lines. The Prime Minister would write to certain people who were recommended to him asking them if, in the event of war, they were willing to serve as members of the Council of the Ministry of Munitions. There would be no salaries, no pay of any sort at the moment. They would probably consent. It would involve very little work then, and when war broke out they would be doing good work for the country. Each one of those men might have a sum allotted to him for an assistant whom he would select himself, who would do all the paper organisation of his department. I should think something in the nature of £1,000 a year would cover his salary and clerical expenses. I believe there are sub-committees working under the Committee of Imperial Defence who have been and are inquiring in detail into the manufacturing capacity of the country. Those assistants would get all the information that they could collect and with their shadow Ministry they would propose who should be the heads of the different departments, who would also be asked if they would be willing to serve in the event of war—of course with salaries in war time; they would have to be paid the same as in the Great War.

In that way, and from the experience of the Ministry of Munitions, which experience has all been left behind on paper, you could build up in shadow the whole of the Ministry of Munitions. You could go so far as to arrange the buildings. Each manager would arrange his clerical staff. The Admiralty and the War Office would arrange what portions of their contract departments could be split off and go to the Ministry. Of course, the Admiralty and the War Office must each keep a part of their own contract departments, but a portion could be split off. The Treasury could arrange for the financial side. Nearly all our trouble in finance, as regards manufacture, was owing to the fact that no provision had been made by the Treasury for increasing the financial staff in war. I am only sketching this very briefly. I think that a scheme of that sort could be very easily worked out and if, unfortunately, we did go to war, then within a week the whole of the Ministry of Munitions could be in place. Mind you, immediately on the outbreak of war, the War Office, the Admiralty and the Air Force would have to place

orders for three months for what munitions they considered necessary. That would be inherited by the Ministry of Munitions and they would supplement it as they thought necessary. One other point. Prices should remain stabilised until the Ministry had settled down at what they were one month before war was declared. That would prevent any rise of price on the outbreak of war and would be a very good basis to work upon.

Sir, if that meets at all with your approval, I would submit that when you examine me and ask me questions you should perhaps bear in mind the two schemes. First, there is this elaborate manufacturing concern which has to carry enormous reserves of machinery, which would be a very great expense to the country and for which you would have to put aside a large sum every year for depreciation. There are some special machines that might become obsolete, or at all events obsolescent, in a very short time. And, mind you, that arsenal would have to expand in the same way as the private manufacturing firms had to extend during the War. They would be handicapped by being centralised instead of being spread over the country and they would have to build additional shops. They would have to put in additional machinery. It would be exactly the same sort of thing that happened during the War if the war was of anything like the same magnitude as the Great War, which came as an absolute shock to everybody concerned. There was not a soul in England—the only man with any vision was Lord Kitchener—who had the foggiest idea of the quantity of ammunition and guns that would be required. I was told at the Admiralty in 1914 that the War would not last six months. Nobody had any idea that it would be such a long war. It was not until trench warfare came along that the country woke up to the fact that we were in for a big thing.

1512. *Chairman*: I want to ascertain, if I can, something about Mr. Mulliner; because he has been represented before us as a very much abused person. Mr. Mulliner was then in the employ of the firm of which you were then manager?

Sir Reginald Bacon: No, Sir.

1513. *Chairman*: Was he not then with the Coventry Ordnance Works?

Sir Reginald Bacon: No. The sequence of events was this. Mr. Mulliner was the head of the Coventry Ordnance Works and a very capable man. He was managing director. I am talking about the early part of 1909.

1514. *Chairman*: Was it not for the Coventry Ordnance Works that you asked the War Office to give an order?

Sir Reginald Bacon: I did not go there until after Mr. Mulliner had left.

1515. *Chairman*: I see.

Sir Reginald Bacon: What happened, briefly, was this. Mr. Mulliner was the head of the firm and he was very anxious to get an order for gun mountings. We were very anxious to give him one, and the Controller and I arranged that he should have an order for 13.5 gun mountings. Unfortunately, the Board decided to build a 9.2 cruiser—which was a lapse on their part. So we said it would be better to give the Coventry Ordnance Works the 9.2 mountings instead of the 13.5 for the first order. Having settled that, and having settled the other orders for the year, the Board suddenly decided not to go through with the 9.2 cruiser. That threw over the Coventry Ordnance Works and their 9.2 mountings. Mr. Mulliner was so angry about that that, unfortunately, he had an interview with the Press and gave away certain communications he had had with the Cabinet and, for that reason, he had to leave the Coventry Ordnance Works.

1516. *Mr. Spender*: Communications with the Cabinet or with the Admiralty?

Sir Reginald Bacon: The Cabinet, in the end.

1517. *Chairman*: I want the sequence of events. Did Mr. Mulliner go out to Germany on his own account?

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

Sir Reginald Bacon: Yes.1518. *Chairman:* That was before you were connected with the Coventry Ordnance?*Sir Reginald Bacon:* That is so.1519. *Chairman:* What was your position at that time?*Sir Reginald Bacon:* Director of Naval Ordnance.1520. *Chairman:* And then Mr. Mulliner came and reported to you what he said he had ascertained in Germany?*Sir Reginald Bacon:* That is so.1521. *Chairman:* Are you able to say that his report was a report of actual facts, or an invention?*Sir Reginald Bacon:* I have every reason to believe that it was absolute fact. There is not the slightest doubt. The only part I remember particularly was one about larger planing machines. That is not the sort of story that anybody would invent. It would never enter their head to invent it, but the fact that they were ordered then, and that armament work was the only work on which they could be employed, pointed directly to Krupp's expanding in their armament factories. Ordinarily speaking, any firm would want only one of those to turn out a set of 13-5 mountings because you would take your different roller paths in succession, but if they ordered anything like four, it showed they were going to have a big push suddenly. That was the point that was in my mind.1522. *Chairman:* I understand the suggestion is that Mr. Mulliner invented something for which there was no foundation at all in fact, in order to try and get an order. It is your view that he was reporting what he had actually ascertained?*Sir Reginald Bacon:* Absolutely. I do not think the idea entered anybody's head at the Admiralty before or after that he had invented anything.1523. *Chairman:* He came to you for the purpose of getting an order if he could?*Sir Reginald Bacon:* No. He came to me in the ordinary course, like the heads of other firms did, about the different orders they had got or prospective orders they were going to get. It was absolutely nothing to do with the information he gave me. It was the same thing when Sir Trevor Dawson gave me the information about the nickel; it was only in the course of an interview about some other manufacture. It was nothing to do with him getting orders. The matter was so important that I passed it on to Mr. McKenna.1524. *Chairman:* But I suppose when he conveyed the information to you he thought it might possibly influence the order.*Sir Reginald Bacon:* Not in the slightest. The orders you give to firms are so stereotyped. You have only a certain number. As Director of Naval Ordnance at the Admiralty, I only had a certain amount of armament orders to give for the ships ordered. A certain portion had to go to Woolwich, by government decision. Then Vickers and Armstrongs had to have a share, and the Coventry Ordnance Works, which had then poked their nose in, also had to have a share. There was no necessity for my having to go outside the ordinary sequence. The thing was so stereotyped.1525. *Mr. Spender:* Would not the fact that the orders for the gun mountings had been varied and altered enter into it?*Sir Reginald Bacon:* No, Sir. We wanted to give one set of gun mountings to Coventry, to cut their teeth. The Controller and myself decided to give them one set of 13-5. The remainder of the orders were to be apportioned between Vickers and Armstrong. Then when the 9-2 cruisers were started subsequently, as an addition to the programme, we thought it was better to give Coventry the smaller guns first and to let the other firms take the bigger mountings, which we did.1526. *Mr. Spender:* What I am suggesting is: Might not that have justifiably annoyed Mr. Mulliner?*Sir Reginald Bacon:* It did.1527. *Mr. Spender:* And might he not then have come to you and said he had information of these large gun mountings in Germany, as an inducement to you—1528. *Chairman:* That was not the order of events?*Sir Reginald Bacon:* That was not the order of events; and if he had I should have paid no attention. Information like that is of negligible account.1529. *Chairman:* That was in 1900, was it not?*Sir Reginald Bacon:* Yes.1530. *Chairman:* Shortly after that you retired, did you, in order to take up this position with the Coventry Ordnance Works?*Sir Reginald Bacon:* Yes, that is so.1531. *Chairman:* It is suggested that people who occupy that sort of position and take that course get special consideration from the Government. You do not seem to have got it when you went and asked for your fuses. That is the only instance we have got.*Sir Reginald Bacon:* I can assure you, Sir, that so far from getting any special consideration it was rather the reverse; because naval officers are apt to be rather annoyed if one of them does leave and go to a private firm. And, as I pointed out, in mentioning my interview with Mr. Churchill, both the Controller and Director of Naval Ordnance, who were really personal friends of mine, wanted to abolish the Coventry Ordnance Works—or rather, cut them off from manufacture, in peace time. Mr. Churchill, who, as I say, has always been very statesmanlike, said "No."1532. *Chairman:* One more question about Mr. Mulliner: Did you or the Government have information, apart from Mr. Mulliner, which conveyed the same sort of impression?*Sir Reginald Bacon:* Yes. The information came from our Attaché. After all, attachés only get more or less what the Government want to give them. Still, you can read a good deal between the lines. He was very much impressed with the fact that the Germans were tending towards increasing their programme. Again, there was a good deal of doubt about one particular ship that was being built by Blum und Voss; they had sentries all round the factory and it was very, very secret. We had information that there was very little doubt that they were building a battleship, although they put it down as an ocean liner.1533. *Chairman:* Now I want to ask a question about competition. You lay stress upon the value of competition, and I see you say in your Note: "My only solace was the fact that we had as our independent designers three armament firms and Woolwich."*Sir Reginald Bacon:* That is so.1534. *Chairman:* Which are the three you are referring to?*Sir Reginald Bacon:* Coventry, Vickers and Armstrongs.1535. *Chairman:* Vickers and Armstrongs have since been amalgamated, have they not?*Sir Reginald Bacon:* I believe so. I do not know the details.1536. *Chairman:* From the point of view of competition, the more armament firms there are the better?*Sir Reginald Bacon:* Oh, much!1537. *Chairman:* With regard to Woolwich and the private firms, you were telling us that the government issued applications for tenders, and the private firms tendered, but Woolwich never did tender.*Sir Reginald Bacon:* No.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

1538. *Chairman*: We are told that Woolwich is in a special position, because there is no appropriation in the annual estimates for Woolwich. It is nominal.

Sir Reginald Bacon: Quite!

1539. *Chairman*: And they are supposed to make both ends meet—I mean that the expenses and receipts are supposed to be exactly equal.

Sir Reginald Bacon: Quite; on paper!

1540. *Chairman*: Yes. Of course, it is all on paper.

Sir Reginald Bacon: All on paper!

1541. *Chairman*: Therefore if they find that their expenditure is above what they proposed to charge for something do they increase the charge in order to make ends meet? How is that worked?

Sir Reginald Bacon: It works like this: Suppose they get an order for a 12-inch gun. When they have finished the 12-inch gun they send in the bill for what it has cost them to make it. That is all. Whatever it has cost them to make it we have to pay. They do not have a body of shareholders waiting for the annual meeting wanting to know why they have not an annual dividend.

1542. *Chairman*: It is not the mere cost to make; because, as you point out, they charge a very substantial sum for depreciation.

Sir Reginald Bacon: Quite! But that was all added to the cost of the article. That was one thing of which we complained. When I was Director of Naval Ordnance we had a Committee that sat on Woolwich, to try and get their prices down, and we were always up against the brick wall of the reserve machinery and the big overhead charges. That was all lumped into the cost. And, of course, the annual output was extraordinarily small for a big concern like that. The overhead charges undoubtedly swamped it. Also there was no incentive—there never can be—to cheap manufacture by the government.

1543. *Sir Thomas Allen*: Have you any idea what their overhead charges were?

Sir Reginald Bacon: No.

1544. *Sir Thomas Allen*: You have told us in the case of private trade they were £600,000. How can you draw any comparison, if you do not know what the other overhead charges were?

Sir Reginald Bacon: I am only speaking from memory as to what happened when I was Director of Naval Ordnance.

1545. *Sir Thomas Allen*: You simply said in your evidence that they could not compete because of overhead charges.

Sir Reginald Bacon: Quite!

1546. *Sir Thomas Allen*: You have told us what the overhead charges were in private enterprise and what we would like to know is how they compare.

Professor Gutteridge: I understood the witness to speak of wages, not overhead charges.

Sir Thomas Allen: No. £600,000 for overhead charges, £1,200,000 for production of materials, and £1,200,000 for wages.

Sir Reginald Bacon: Quite so, Sir! I gave you those figures. They are roughly the figures which we used to work on, which remain in my memory. I also have in my memory that the costs of Woolwich were due to the high overhead charges. But, mind you, I am talking about a matter of 25 years ago.

1547. *Sir Thomas Allen*: But you do see that it would help us very considerably if we had comparative figures of the overhead charges?

Sir Reginald Bacon: Yes. They could be turned up in the reports of the committees; but I have not the foggiest remembrance of the actual figures.

1548. *Sir Thomas Allen*: It is rather unfortunate that you should quote the overhead charges in respect of private trade, and that we should be in the dark as to what are the overhead charges at Woolwich.

Sir Reginald Bacon: I had it brought home to me very closely when I was managing director of a firm that my overhead charges were nearly 120 per cent., instead of 50, on account of the small manufacture we had. So those figures naturally

remain in my mind. I knew that my rivals could manufacture sometimes at 50 per cent. while I was manufacturing at 120. A figure on paper about Woolwich does not remain in my mind after 25 years.

1549. *Sir Thomas Allen*: It did strike me, as a business man, that £600,000 overhead charges on an out-put of £3,000,000 was excessive for private trade.

Sir Reginald Bacon: If you take armament

manufacture you will find, if anything, that estimate

is below the actual cost. You have no idea. I

will take one small item that perhaps you have

never thought of. That is, the failures of tubes

for making guns. You may have a tube coming

in for a gun, you have got to rough machine it

before you can take a test piece. You do a certain

amount of work on it, you test it, and it falls

under test.

1550. *Sir Thomas Allen*: With regard to Woolwich,

we understand that repair work is the greater body

of output and that therefore the overhead charges

would be relatively higher on repair work as against

construction.

Sir Reginald Bacon: We had no repair work

at Coventry.

1551. *Sir Thomas Allen*: I am speaking of Woolwich.

Sir Reginald Bacon: I do not know how they

cost their repair work. I take it they charge, like

you always do, so much a shop. I dare say you know

that some manufacturers cost by machine; every

machine has its own cost and if that machine is

used for an hour the cost of that machine is added

on to the work. Other firms lump them together

and take the cost of a shop. That is to say, if they

are divided up, so that they have light machines

in one shop and heavy machines in another, the cost

of one shop per hour is so much and the cost of

another shop is so much. Then you have to put on

top of that your rates, your taxes, your water

supply, your electricity supply, your heating, light-

ing—all those permanent charges—and then you get

the sub-permanent charges like oil, waste and con-

sumable stores, which are very difficult to charge to

each individual job, and which have to be lumped

together.

1552. *Sir Thomas Allen*: The private armament firm

contracts for a completed article. It seldom gets

any repair work to do. Repair work is sent to

Woolwich Arsenal. Am I correct?

Sir Reginald Bacon: I should think you were

probably correct from the Army point of view, and

that the naval repair work would go to the dock-

yards. The reason for that is that we tried about

1896 or 1897 putting ship repair work out to private

firms, and the cost was prohibitive, because there

was no means of checking the overhead charges. But

there were several cases—I do not know whether

you remember—where we had repair work out to

contract, and that cured the Admiralty—I can only

speak for the Admiralty—of ever putting repair work

out to private enterprise.

1553. *Sir Thomas Allen*: Then it must necessarily

be the case that overhead charges where repair work

is undertaken in detail, and more particularly, must

be greater than in a firm where they deal with the

completed article only.

Sir Reginald Bacon: I had never thought of

the point before but offhand I should say it made

no difference if you cost per shop. Your job works

out at the number of hours the work is in the shop,

whether it is repair or whether it is new.

1554. *Sir Thomas Allen*: I am speaking now with

regard to having a contract for a finished product,

as against sending the machine in to be repaired.

Sir Reginald Bacon: But then you estimate

for the cost of the repair—you are talking about a

private firm?—

1555. *Sir Thomas Allen*: Yes.

Sir Reginald Bacon: —before you get the

order as a rule; but in the days of which I spoke we

did not, and that is where the trouble came in.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

1556. *Chairman*: There is only one further matter that I wish to ask you about—that is, the McKinnon Wood Report. Would you mind taking a copy of the evidence* we had yesterday—Mr. Noel Baker's evidence? It is in paragraph 146 and onwards. The question is: What is the proper inference to be drawn from the terms of that Report? There is no detailed statement of the evidence that was given; there are only, apparently, the shorthand notes of the secretary, who took minutes, as it were, of the evidence of each of the witnesses and the details of each day's work of the Committee. That is all the material there is with regard to the evidence and so forth—except the Report.

Sir Reginald Bacon: Yes.

1557. *Chairman*: Two different views, apparently, have been taken with regard to the Report—one view has certainly. At present I rather hold another. The view of Mr. Noel Baker is expressed in paragraph 149. May I just read it, and then you will follow it? He says:

"It is true that their Terms of Reference restricted them to the future of the Government factories at Woolwich. But at that time Woolwich was employing 74,000 workers—far more than would be required for the peace-time needs of the nation. Thus the Committee were in effect reporting on how the nation should in future procure its arms. For a limited number of orders they had to choose among many potential sources of production—the pre-War ordnance factories, including Woolwich, the old established private armament firms, the new national factories, the other engineering firms which during the War had entered into armament production. If they chose to recommend that Woolwich should continue, and be given work, they were in reality proposing that the other sources of production should be closed down, unless by express reservation they made it plain that means should be found to keep these other sources in existence."

You were a member of that Committee, and I believe that you drafted the Report, or assisted to draft it.

Sir Reginald Bacon: I helped to draft it.

1558. *Chairman*: Is this the true inference from the Report of the Committee: That you proposed that the other sources of production should be closed down and that Woolwich alone should remain as the one source of production?

Sir Reginald Bacon: No. It most certainly was not the case; because so far as my memory serves me the question was never raised about not giving work to the other armament firms. I think that paragraph might have been somewhat loosely worded. I do not know, but it seems to refer to the extra works that were introduced. I can assure you I do not remember the question ever being raised on that Committee about the other armament firms being closed down. I would like to say that our great difficulty on that Committee was the fact that we could not find any commercial work which we could turn Woolwich on to. It seemed to be so foreign to the ideas of Englishmen for a government factory to start a selling department and have commercial travellers going about the country trying to sell, as it were, pots and pans, and things of that description. Several suggestions were made by the people at Woolwich as regards such manufacture but we could not recommend that they should do it. That was our great difficulty.

1559. *Dame Rachel Crowdy*: You say that Woolwich was badly situated for cheap manufacture; that they were a sheltered concern and the incentives to cheapen costs were absent. You would agree, would you not, that after the War broke out, at the end of 1914 and the beginning of 1915, the private manufacturers demanded higher prices than those at which Woolwich could produce war material?

Sir Reginald Bacon: Do you mean during the War?

1560. *Dame Rachel Crowdy*: Yes. I said "at the end of 1914 and the beginning of 1915". The private manufacturers in fact were asking higher prices than the price at which Woolwich could produce, were they not?

Sir Reginald Bacon: I do not know at all.

1561. *Dame Rachel Crowdy*: That is the conclusion I draw from Dr. Addison's evidence.

Sir Reginald Bacon: I cannot say. May I say one thing about those prices? They depended largely—of course, all price does—upon the number of orders they were given. There was a good deal of mixture. The private firms had probably had a good many different sorts of armaments to manufacture—possibly more than Woolwich. It is very difficult. I remember so well Lord Fisher once saying to his secretary "I want you to get me out figures about a certain deal". The secretary said "What do you want to prove, Sir?" Lord Fisher replied "What has that to do with you?" "Because", he said, "I can get you out figures to prove anything". The factors in manufacture are so many that you could produce absolutely true returns which would give you absolutely different ideas.

1562. *Dame Rachel Crowdy*: I am not thinking of returns. I am thinking of the correspondence submitted by Dr. Addison in his evidence. He says that private manufacturers had actually asked such high prices finally that the government had refused payment and fixed prices. Then, says Dr. Addison, the prices came down, and the private manufacturers were able to manufacture at the price fixed by the government and—to use your own words—to pay "dividends to the eagerly waiting shareholders." I think you used those words. I wondered whether, in your mind, the fact that the private manufacturers were asking higher prices than the cost of production at Woolwich, had anything to do with the shareholders eagerly waiting for dividends.

Sir Reginald Bacon: No. I think the work Dr. Addison did was magnificent, and I think the work that was done by the Ministry of Munitions in keeping prices down was magnificent; but it rather upholds my contention when you say that with the prices finally fixed, which were equal to or less than those of Woolwich, they were able to pay a dividend to their shareholders.

1563. *Dame Rachel Crowdy*: I was, in relation to my last question, not saying that they were equal to or less than those of Woolwich. I did not bring that into account at all.

Sir Reginald Bacon: My own experience is that the Ministry of Munitions did excellent work in keeping down prices. There is always a tendency, naturally, for prices to rise unless they get some check.

1564. *Dame Rachel Crowdy*: Then you said "I cannot imagine the British Government selling armaments abroad". Do you remember that?

Sir Reginald Bacon: Yes.

1565. *Dame Rachel Crowdy*: Many of our witnesses have envisaged that possibility, that the government might sell abroad. But in any case, do you feel that the export is frightfully important?

Sir Reginald Bacon: I do.

1566. *Dame Rachel Crowdy*: From the point of view of finance, or from what point of view?

Sir Reginald Bacon: From the point of view of wages.

1567. *Dame Rachel Crowdy*: There again you differ very much from many witnesses we have had, who declare the export to be almost negligible—£3,000,000 or £4,000,000 worth.

Sir Reginald Bacon: If you are prepared to discount £3,000,000 or £4,000,000 worth of orders, which, as I say, probably means employment for 10,000 or 12,000 people a year, well and good.

1568. *Dame Rachel Crowdy*: I am asking you for your opinion.

Sir Reginald Bacon: Why should we turn that over to a foreign country?

* See Minutes of Evidence, 10th Day, Appendix.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

1569. *Dame Rachel Crowley*: I was very interested in your saying in your Notes that "a small country that obtains its armaments from another country is bound to it by very strong ties." I see your point of view. Anyone who has worked with the League of Nations for as long as I did knows that benefits by great countries are very clearly recognised by small countries when votes are taken and sometimes when moral support is required for leadership. But that may act in two ways, may it not? You state in your Notes that "when the question of re-arming the Turkish army came along the German Minister for foreign trade went to Constantinople and refused to leave until he had obtained the contract for his country. Had the Turkish army been armed with English pattern rifles, guns and ammunition the question of on which side Turkey entered the War would probably have received a different solution." I have been to Turkey and I have a good many Turkish friends. I have always understood from them that one factor in the case was the fact that the British had completed two cruisers for Turkey, and the moment war broke out, although Turkey had not then declared her future line of policy at all, those cruisers, which had been paid for and were finished, were not delivered. This created a strong feeling against the British. So occasionally it may act rather the other way.

Sir Reginald Bacon: May I explain that, because it is an interesting point?

1570. *Dame Rachel Crowley*: It has often been made.

Sir Reginald Bacon: The ships were being built were two battleships. One was subsequently called the *Erin*; the name of the other I forget. We seized them on the declaration of war. The result was that Turkey was at the mercy of the Black Sea Fleet and it was not until after the escape of the *Breslau* and the *Goeben* up the Dardanelles to Constantinople that Turkey felt herself strong enough to go into the War against us. If the *Goeben* and the *Breslau* had been stopped in the Mediterranean it was an even chance that Turkey would have come in on our side, because of the Black Sea Fleet, and it was the presence of the fleet of our allies in the Black Sea that made Turkey so sore about these two battleships being taken. I think that is the explanation.

1571. *Dame Rachel Crowley*: You would admit that the supply of armaments by a great power to a small country may act either way—for or against the supplying country—if orders given in peace time are not delivered in war time to governments which are neutral?

Sir Reginald Bacon: I really do not see why, unless you supply bad articles. If your munitions are supplied by a country, you have got to keep reserves, and you are bound to that country. It is a very, very great practical tie in my opinion.

1572. *Dame Rachel Crowley*: You are not bound to a country if it undertakes a contract and does not deliver it in the event of war breaking out?

Sir Reginald Bacon: You must draw a distinction between an order that is given in peacetime and what happens on the outbreak of war.

1573. *Dame Rachel Crowley*: I thought the order was given to Germany by the Turkish Army in peacetime?

Sir Reginald Bacon: Yes, but our battleships were a peace-time order. The order was given two years before.

1574. *Dame Rachel Crowley*: So was the Turkish Army's?

Sir Reginald Bacon: Yes.

1575. *Dame Rachel Crowley*: I have another question to ask. You said you thought that under the scheme you proposed prices could be fixed at the prices ruling one month before the outbreak of war, did you not?

Sir Reginald Bacon: Yes.

1576. *Dame Rachel Crowley*: What about the prices of raw material: Could private firms carry on on your basis, if raw material prices rose?

Sir Reginald Bacon: Yes, I certainly think you could fix all prices on the outbreak of war at

the prices which prevailed one month before the war broke out. That would be subject to modification afterwards, but it would be a standard to go upon until the Ministry got into its stride. That should be done.

1577. *Dame Rachel Crowley*: To prevent excessive prices?

Sir Reginald Bacon: To prevent excessive prices on the outbreak of war.

1578. *Dame Rachel Crowley*: The only other matter of which I have a note is a very unimportant one. You said, *apropos* Mr Mulliner, you thought it would never "enter their heads"—I put quotation marks there—to invent information. But in fact might it not enter their heads—I think it might quite well enter my head—to invent a story of that kind if I were not a particularly scrupulous person and if I wanted these possible orders. I am thinking of it rather in terms of the drug traffic, the fight against which I have been connected with.

Sir Reginald Bacon: Come, come! There is a little difference between the drug traffic and armament firms.

1579. *Dame Rachel Crowley*: But we know, do we not, that certain firms—we will not say in this country—have encouraged war scares, and certain newspapers owned by armaments interests have encouraged war scares, in order to get themselves orders. At least so I am told by members of the Nye Committee, with whom I talked a good deal in the States. Perhaps that has not happened in our country.

Sir Reginald Bacon: I cannot imagine it. I would like to make this point: You have not quoted me quite correctly. I did not say that no armament manufacturer would invent any story. I said that Mr. Mulliner could not have invented the story about the machines, because it was a point that would never have entered anybody's head. If I were to invent a story about armaments I should never mention the fact that a firm was putting in a particular class of machine.

1580. *Dame Rachel Crowley*: It would be rather a good story?

Sir Reginald Bacon: It would, if you thought of it. I should not trouble about such an abstruse point.

1581. *Dame Rachel Crowley*: Perhaps Mr. Mulliner, or Mr. X, Y or Z might.

Sir Reginald Bacon: No, no!

1582. *Sir Kenneth Lee*: You say in your Notes: "Another great disadvantage of concentrating manufacture in a single supply factory is that there will be no competition." Do you contemplate, if the State undertook all manufacture of arms, that there would be only one single factory?

Sir Reginald Bacon: I must honestly confess it is a contingency I never thought of before I read Dr. Addison's evidence, but he seemed to imply it, that the great economy was that you would have the whole of the manufacture under one head.

1583. *Sir Kenneth Lee*: You would not suggest that anything like that was likely to happen?

Sir Reginald Bacon: My goodness, no! I think it would be fatal.

1584. *Sir Kenneth Lee*: Supposing the government undertook to manufacture, it would undoubtedly have a number of factories?

Sir Reginald Bacon: Look at the Gilbertian situation that would arise. When you have one factory manufacturing cheaper than another, what happens?

1585. *Sir Kenneth Lee*: I am only asking you. Would not the government be likely to have a number of factories?

Sir Reginald Bacon: I do not think so. They must have a factory for each different sort of manufacture—guns and mountings would probably go to one factory, machines guns and shells would probably go to another. They would separate the factories from that point of view; but it would be highly uneconomical to have more than one factory manufacturing the same article.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

1586. *Sir Kenneth Lee*: Do you think they would be willing to take the risk of having all the manufacture of one article in one place?

Sir Reginald Bacon: I think it would be taking a risk to have a single government factory. 1587. *Sir Kenneth Lee*: I am suggesting that the government could have factories in different parts of the country, up-to-date factories, and then there would be competition between the different factories.

Sir Reginald Bacon: Yes. But just consider for one moment. If you have six factories in different parts of the country, with the limited amount of manufacture that you have in peacetime, how uneconomical it would be! There would be an excuse, perhaps, for having a single factory for manufacturing one type of article in peace, because the peace orders might keep you running fairly economically, but if you were to split up your manufacture you would not have any economy, you would have all the overhead charges of the establishment, all the salaries of managers and all the rest of it. It would be a terrible expense. I think perhaps it would be well carefully to survey the amount of peace orders that come in and the extraordinary smallness of the quantity compared with the establishment that was forecasted by Dr. Addison to supply them. I am perfectly certain the cost would be so extreme that you would have an outcry at once.

1588. *Sir Kenneth Lee*: Could you tell us the amount that was spent by the Coventry Ordnance Works on research when you were managing director?

Sir Reginald Bacon: No, I could not. All I can tell you is that we had a drawing office with from 36 to 40 draughtsmen, which was a very heavy expense; but it was amply repaid.

1589. *Sir Kenneth Lee*: What sort of people did you have to do the research work?

Sir Reginald Bacon: We had no research work, speaking generally, apart from design. The pure research work was always done by the Sheffield firms, of which, I think, Thomas Firth and Son were the biggest as regards research. We did not have any research of our own at all.

1590. *Mr. Spender*: The question of the two Turkish battleships raises a rather interesting point. By what firm were they being built?

Sir Reginald Bacon: I could not say.

1591. *Mr. Spender*: But it is part of the contract, is it not, that in case of war a government may commandeer, for its own service, ships that are in course of building? Was not that part of the contract?

Sir Reginald Bacon: I could not say.

1592. *Mr. Spender*: Do you say it is not part of the contract, if a private firm undertakes construction of a battleship for a foreign country, that in the event of war the government should be able to commandeer it?

Sir Reginald Bacon: I could not say.

1593. *Mr. Spender*: It is commonly affirmed.

Sir Reginald Bacon: I have never had anything to do with contracts for battleships, but armaments must be subject to being commandeered.

1594. *Mr. Spender*: I am only speaking of ships built for neutrals—as Turkey was then. Did the figures that you gave us include the two Turkish battleships?

Sir Reginald Bacon: They had not come; they were not finished then.

1595. *Mr. Spender*: Your figures—I am not criticising them—differ a good deal from the ordinary official figures that have been given to us. I do not know whether you have read Mr. Woodhouse's *History of Naval Competition*.

Sir Reginald Bacon: Do you mean the figures as regards the Grand Fleet and the High Seas Fleet?

1596. *Mr. Spender*: Yes.

Sir Reginald Bacon: On the 1st January, 1915, the Turkish ships had not been delivered.

1597. *Mr. Spender*: They came in afterwards?

Sir Reginald Bacon: Yes.

1598. *Mr. Spender*: And was there not a Brazilian?

Sir Reginald Bacon: I cannot say. You get an accident in the Fleet and your numbers are reduced.

1599. *Mr. Spender*: Mr. Mulliner did not tell you about what really comes out in the German documents—that the Germans themselves, in spite of their denials, were preparing their 1911-12 programme in 1909?

Sir Reginald Bacon: Of course he did not know that, but we suspected it. Mr. McKenna was extraordinarily clever in deducing from the small amount of information we had, and his deductions were very close to what happened in the end.

1600. *Sir Philip Gibbs*: May I ask you what establishments were under your control when you were Director of Naval Ordnance?

Sir Reginald Bacon: None. I do not think I had any establishments.

1601. *Sir Philip Gibbs*: But you were in control of the naval arsenals?

Sir Reginald Bacon: No, nothing at all. 1602. *Sir Philip Gibbs*: What was your position, then, as Director of Naval Ordnance?

Sir Reginald Bacon: My position was this: I had to do with the design requirements of the new ships that were being built, all the ammunition, and guns, and gun mountings, and putting forward proposals as regards improvements in armaments—in fact everything that dealt with the armaments in the Navy. Nothing to do with the actual manufacture.

1603. *Sir Philip Gibbs*: I suppose you were brought in very close touch with the experts in each department?

Sir Reginald Bacon: Which department?

1604. *Sir Philip Gibbs*: The experts in the various departments supplying naval ammunition.

Sir Reginald Bacon: You mean the private firms?

1605. *Sir Philip Gibbs*: No, I mean the government experts.

Sir Reginald Bacon: The only experts we had as regards ammunition were the Ordnance Committee.

1606. *Sir Philip Gibbs*: Were you not in touch, for instance, with Colonel Dennis, who was directing the gun mountings and so forth at Woolwich?

Sir Reginald Bacon: Speaking generally, no. We used to work through the Ordnance Committee. I will not say that we did not occasionally, but it was not at all recognised.

1607. *Sir Philip Gibbs*: Were you able to form any judgment at all about the efficiency of the Royal Arsenal?

Sir Reginald Bacon: I should think the Royal Arsenal was extraordinarily efficient in the work it turned out. The only thing we had to judge on was the price. I think Woolwich turned out most excellent work always.

1608. *Sir Philip Gibbs*: But surely you were able to judge the quality?

Sir Reginald Bacon: Excellent!

1609. *Sir Philip Gibbs*: And also to judge the design?

Sir Reginald Bacon: Design is a very mixed factor. Woolwich had nothing to do with hydraulic gun mountings. They never made one. That was entirely private manufacture and the designs were entirely owing to Vickers and Armstrongs to begin with, with later modifications by the Coventry Ordnance. Guns were designed by Woolwich and by Vickers and by Armstrongs and the designs were submitted to the Ordnance Committee, who gave their opinion.

1610. *Sir Philip Gibbs*: What I am really trying to find out is whether you feel that in the Royal Arsenal and the Royal Ordnance establishments there were a number of very highly trained expert brains. Would you agree to that?

Sir Reginald Bacon: Yes, of course.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

1611. *Sir Philip Gibbs*: Is it not a fact that the private manufacturers draw many of their best brains from the naval establishments?

Sir Reginald Bacon: I should say no. I would put it a little differently. The private firms draw people with practical experience from the Arsenal and from the private establishments. When I went to Coventry I drew one man from Portsmouth who was worth his weight in gold to me, because of his practical experience in erecting mountings. While I was at Coventry I drew one man from the fuse factory who was almost invaluable to me from the point of view of practical experience, but I never drew any man for his theoretical experience.

1612. *Sir Philip Gibbs*: It is on record—I think it is really beyond dispute—that a great number of employees of private manufacturers are actually drawn from the Admiralty and from the Ordnance Works as directors and controllers.

Sir Reginald Bacon: Again, I think, it is nearly all practical work. When you come to consider the Navy, you had Lloyd and you had Honour, both gunnery officers, going to Armstrongs because of their practical knowledge. Trevor Dawson went to Vickers because of his practical knowledge. It is nearly all practical knowledge.

1613. *Sir Philip Gibbs*: You draw a distinction between practical knowledge and designing, in expert work?

Sir Reginald Bacon: Oh! greatly! You must remember this: The government are the only people who can carry on a full-scale trial, 12 inches to the foot, as regards armaments. Ships and everything else are built according to the government experience. The government have all the experience with regard to guns and gun mountings, and it is only by work between the government and private firms that you get the best article. The private firms supply a good deal of the brains and the government supply nearly all the practical experience. I started submarine boats in November, 1900, and I worked with Vickers. The Admiralty washed their hands of submarine boats. They would have nothing to do with them, because Sir William White was adverse to them. The engineer-in-chief washed his hands of the engines because they were petrol engines in a confined space. I went to Vickers and there we had a drawing office established on the ship side, and on the engine side. We worked out the whole of the design of the submarine boats right up to 1904, when they were proved to be a thorough success. Then the government departments took them over. That was a very good example of the way the private firms worked in with the practical experience of the navy and produced in the end the best results.

1614. *Sir Philip Gibbs*: The point I am trying to work out is this: That it might be possible under a different system to have complete control and manufacture of arms by the government and that previous experience shows that the government has a call on many of the best brains of the country. What I would like to ask you is this: Do you think that such a system is capable of expansion?

Sir Reginald Bacon: The great point is this: In this wicked world you have got to hold out financial rewards.

1615. *Sir Philip Gibbs*: Yes, I see you make a point of that. But may I ask you why you think it impossible for government to pay its servants properly?

Sir Reginald Bacon: They will not.

1616. *Sir Philip Gibbs*: Why not?

Sir Reginald Bacon: Because immediately the dockyard superintendent turns round and says "Here is a man of the same standing as myself at Woolwich who has had his salary increased. I want my salary increased".

1617. *Sir Philip Gibbs*: Surely the quality of a man's brains has to be taken into consideration, even in government service?

Chairman: It is quite new to you?

Sir Reginald Bacon: It is quite new to me. When you go over to America you find men who are paid £40,000 a year. I dare say you will find the managing directors of a great many concerns in England are paid £7,000 or £10,000 a year. But you cannot do that with government employees.

1618. *Sir Philip Gibbs*: I cannot see why not. Supposing we had a complete system of design in naval and military work why should we not pay these high experts the obvious market price of their brains?

Sir Reginald Bacon: Even if you have the best brains you still miss the irritation of competition. You must have competition to get the best results. 1619. *Sir Philip Gibbs*: But, after all, the navy is not subject to competition in its strategy, tactics, evolutions and in the control of a battleship. You would not say to me that because of the absence of competition naval officers are inefficient?

Sir Reginald Bacon: But there is competition. 1620. *Sir Philip Gibbs*: Not within the Navy?

Sir Reginald Bacon: Oh! yes. There is the most strenuous competition.

1621. *Sir Philip Gibbs*: Financial competition?

Sir Reginald Bacon: No. It comes down to finance in the end. Take every six months: The promotions from Lieutenant-Commander to Commander and from Commander to Captain.

1622. *Sir Philip Gibbs*: Why should not the same system be adopted in the government factory—promotion by merit?

Sir Reginald Bacon: How are you to judge merit?

1623. *Sir Philip Gibbs*: In exactly the same way as an admiral judges the merit of his captains. However, it is rather theoretical.

Sir Reginald Bacon: It is very theoretical.

1624. *Sir Philip Gibbs*: It is important from the point of view of our witnesses. Several witnesses, like General Sir Stanley von Donop and yourself, keep on stressing the point that because a man is a government servant he cannot be efficient. I think that is an argument that very gravely reflects on government servants.

Sir Reginald Bacon: Please do not read that into my evidence. I have never said that because a man is a government servant he cannot be efficient. What I do say is that every government department loses the incentive of competition.

1625. *Sir Philip Gibbs*: Is there not another incentive—honour and promotion?

Sir Reginald Bacon: Very little promotion.

1626. *Professor Gutteridge*: Do you mean that the job has become rather a "cushy" one?

Sir Reginald Bacon: That is so. They have not the constant irritation of having to show results. No government office need show any competitive results at all. And do remember this: That the people in positions like that of the D.N.O. and others at the Admiralty have war hanging over their heads, and they must have the best and the newest, and the only way to get that is by competition.

1627. *Sir Philip Gibbs*: That is a very argumentative thing?

Sir Reginald Bacon: It is.

1628. *Sir Philip Gibbs*: You yourself, as Director of Naval Ordnance, were not subject to competition; your promotion was due to ability; and in many other branches of civil life you get an incentive, not of finance, but of honour and distinction and achievement. Still, I will leave that point.

1629. *Chairman*: You have passed through a period of competition in your professional life?

Sir Reginald Bacon: I have.

1630. *Sir Philip Gibbs*: Competition with your brother officers?

Sir Reginald Bacon: It is just as keen.

1631. *Sir Philip Gibbs*: Why should there not be competition?

Sir Reginald Bacon: Because if you get into the routine of getting up every morning at the same

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

time and catching the 8.30 and coming back every evening at the same time, you lose the competitive spirit.

1632. *Professor Gutteridge*: You do not get the same competition in the army as you do in the navy?

Sir Reginald Bacon: I cannot say about the army. I know that in the navy you have the most strenuous competition.

1633. *Sir Philip Gibbs*: You said once or twice in your evidence and once or twice in reply to your answers to questions that the costs of Woolwich were higher than those of private manufacturers.

Sir Reginald Bacon: Yes.

1634. *Sir Philip Gibbs*: But I must say that it seems to me that all the evidence we have previously had is dead against you on the subject.

Sir Reginald Bacon: I can only trust my memory.

1635. *Sir Philip Gibbs*: You were Director of Naval Ordnance from 1907 to 1909?

Sir Reginald Bacon: Yes.

1636. *Sir Philip Gibbs*: And in the same period there was a gentleman named Dr. Gilbert Slater, who, on behalf of the Woolwich Joint Conference on Discharges from the Arsenal, published in *The Times* the following advertisement of comparative prices. May I read one or two of these? For 18-pounder gun carriages—

Sir Reginald Bacon: It did not affect us in the navy.

1637. *Sir Philip Gibbs*: No, but these were articles turned out by Woolwich for which I have comparisons with private manufacturers. 18-pounder gun carriages—£343 14s. 4d.; contract work—£672.

Chairman: Were not these prices including the return on capital for erecting new factories?

Sir Philip Gibbs: No, Sir, because these are prices in 1907. There is a long list of them—13-pounder gun carriages: £400 at Woolwich; £631 for outside work. And all the other items in the list show a similar disproportion. That was for a period during which you were Director of Naval Ordnance?

Sir Reginald Bacon: Quite!

1638. *Sir Philip Gibbs*: And was before the War. So that there were not abnormal circumstances?

Sir Reginald Bacon: Quite!

1639. *Sir Philip Gibbs*: Does not that rather disprove your contention?

Sir Reginald Bacon: Certainly it does, but I only speak from memory of the naval prices. This is why it is fixed in my mind—I have no figures of any sort or description—I know ever so well, with the amount of money we had to dispose of, how irksome it was to have to go to Woolwich, who charged us more.

1640. *Sir Philip Gibbs*: I think on the evidence before us Woolwich did not charge you more. We have the figures, and so far as all the figures I have seen are concerned they did not charge you more.

Sir Reginald Bacon: I should very much like to check the figures. Why did we have—as you will see by referring to the records—something like four or five committees that sat on Woolwich and Woolwich expenses? The last one sat while I was there.

1641. *Sir Philip Gibbs*: I think it was due partly to the fact that there was no scientific costing system at Woolwich.

Sir Reginald Bacon: It was too scientific.

1642. *Sir Philip Gibbs*: Was that the trouble?

Sir Reginald Bacon: They had put all the reserve machinery, and depreciation on that, into current contracts. I do not know if those figures you have are the price charged or the actual manufacturing cost.

1643. *Sir Philip Gibbs*: In the Report of the McKinnon Wood Committee it is mentioned several times that it was very difficult to establish costs, because there was no definite or scientific costing system at Woolwich. That is stated several times in the Third Interim Report.

Sir Reginald Bacon: I cannot understand that, because I went down to Woolwich and saw the whole of their costing system. The trouble was the reserve machinery. Another thing: Woolwich is built on extravagant lines, with great big stone buildings. They had to charge depreciation on every building and so it ran up the costs.

1644. *Sir Philip Gibbs*: This is an important point for this Commission. It is one of the things that we have to decide. Therefore I want to press the point a little further. You rather took for granted that the overhead charges of a government establishment are almost necessarily higher than those of the private manufacturer.

Sir Reginald Bacon: No, Sir.

1645. *Sir Philip Gibbs*: You did not take that point?

Sir Reginald Bacon: Oh, no.

1646. *Sir Philip Gibbs*: You do not suggest that point with regard to Woolwich?

Sir Reginald Bacon: No. If you mix it with the reserve machinery it will be. You have to allow for your depreciation on your machinery and buildings, and you have to allow a very high rate, so if you have a large amount of reserve machinery and buildings it runs up the cost of the work tremendously. We always tried to separate the two—at least I did—the reserve side and the manufacturing side, but they would not do it.

1647. *Sir Philip Gibbs*: That experience does not seem to exist in other countries. For instance, the American Nye Committee reported that overhead expenses in government arsenals are slightly lower than in the private manufacturing firms, and there are no selling costs.

Sir Reginald Bacon: Did they have reserve machinery?

1648. *Sir Philip Gibbs*: I think they must have done.

Sir Reginald Bacon: I do not know. I would not take it at all for granted.

1649. *Sir Philip Gibbs*: Sir John Simon said that state arsenals are useful and necessary as a means of checking prices.

Sir Reginald Bacon: They are no good at all. It was our great complaint. That was why we backed up Coventry—Jellicoe and I—for all we were worth, in order to get an independent firm in who would check prices. Woolwich was quite useless for checking prices.

1650. *Sir Philip Gibbs*: That is not the experience recorded by Dr. Addison.

Sir Reginald Bacon: But Dr. Addison was working a totally different system. We were working under absolutely different conditions. I was working under peace conditions with a big arsenal and Dr. Addison was working with a highly, well organised system of ammunition supply. You cannot compare the two.

1651. *Sir Philip Gibbs*: Dr. Addison and other witnesses have produced a certain amount of evidence to show that the private manufacturers were established in certain rings. One does not want to give a sinister meaning to the word "ring."

Sir Reginald Bacon: They were.

1652. *Sir Philip Gibbs*: I notice that Mr. Arnold Forster, one of our witnesses, said that those armament rings were, and are still, in a position to play into each other's hands by collusive tendering for government contracts.

Sir Reginald Bacon: Undoubtedly.

1653. *Sir Philip Gibbs*: It is probably true?

Sir Reginald Bacon: It is probably true of every manufacture. Every manufacture must have a ring if it is going to succeed, otherwise you get undercutting and bankruptcy.

1654. *Sir Philip Gibbs*: But you also get high prices?

Sir Reginald Bacon: That is, the business of the government to check, and the government ought to be able to check it with the government factory.

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

if you have your costing on a reasonable system the government factory should be able to check private firms. That is what I was trying to press home.

1655. *Sir Philip Gibbs*: I asked Dr. Addison one or two questions about these rings and I quoted some evidence which was brought before the McKinnon Wood Committee that there was a very close and important steel ring. Dr. Addison agreed that there was and he added lead, aluminium and other minerals; and he claimed that Woolwich was very severely handicapped in prices by not being able to break those rings. From your experience, would you agree with that?

Sir Reginald Bacon: I would not say they were very seriously handicapped, but they had to pay a bigger price for their steel than what the private manufacturer could arrange in his own shops. They put on their percentage of profit and Woolwich had to pay that.

1656. *Sir Philip Gibbs*: Do you not think that perhaps that is a slight point in favour of government manufacture, that is to say, that it would possibly reduce the cost to the nation?

Sir Reginald Bacon: Yes, but against that you have to put the fact that the government factory has not got to pay a dividend.

1657. *Sir Philip Gibbs*: No; but you also have to consider the point that the private manufacturers work on a profit system?

Sir Reginald Bacon: Yes; they work on a profit system.

1658. *Sir Philip Gibbs*: Which does not enter into national manufacture?

Sir Reginald Bacon: If the national factory has to pay more for its steel because it has to buy it from a private firm, still, at the same time, the national factory has not got to pay a dividend on its work and, therefore, the two, to a certain extent, are balanced.

1659. *Sir Philip Gibbs*: I feel myself that the cost to the nation might be higher under the private profit system.

Sir Reginald Bacon: It might. It all depends on checking prices. The Ministry of Munitions had a very sound scheme. There is no reason why that sound scheme should not remain in force and prices be checked. When the War commenced there was no system of checking prices and private manufacturers could charge what they liked.

1660. *Sir Philip Gibbs*: They did charge very heavily for cordite in particular, did they not? There was great trouble over cordite?

Sir Reginald Bacon: I do not know.

1661. *Sir Philip Gibbs*: I hope I am not troubling you by this series of questions.

Sir Reginald Bacon: I love it!

1662. *Sir Philip Gibbs*: I very much want to get your opinion. You say in your Notes, "As Director of Naval Ordnance I always had a haunting dread that when war broke out we might find that our enemies had something up their sleeves better than what we had, and that we should find ourselves at a disadvantage."

Sir Reginald Bacon: Yes.

1663. *Sir Philip Gibbs*: That is true, no doubt, but is it not also a fact that they might have our designs up their sleeves?

Sir Reginald Bacon: I would not mind that as long as we started on a fair basis. While I was at the Admiralty there were a lot of things that were confidential, but there were only one or two things that were secret—that I did not want the foreigner to know about. In my position as Director of Naval Ordnance, I would much sooner the enemy knew everything we had and that we knew everything they had, and that we started on a fair basis. But there was the mine. The mine has a very peculiar history. In our old mines we had an electrical arrangement inside so that when the mine was bumped it went off. That gave infinite trouble and

somewhere in the middle of the nineties we went in for new mines and laid it down as a maxim that electricity was not to be used. The Admiralty did not mean that electricity was not to be used. What they meant was that bare electrical contacts were not to be used. The Germans came along with a mine which had no bare electrical contact, but a complete wire circuit. The battery itself was empty. When the mine was bumped a glass tube was broken and bichromate of potash was dropped into the battery, thus making it active and the mine went off. We never adopted that mine. Our mines were quite efficient against ships, but not against submarines. Actually it was not until the end of 1917 that we got a design of mine supplied and approved which we could use for stopping submarines. I could have closed the Channel in 1915 absolutely to submarines if I had had the mines, but that one little slip-up made all the difference and cost us probably millions of tonnage of ships. It is a very ticklish thing, and I do beg of you, if you are going into any scheme, to bear in mind that war might break out and that we must be level with other countries.

1664. *Sir Philip Gibbs*: Under the private system of manufacture, the private firm, when they improve a design, may immediately, or subsequently, hand it over to potential enemies of this country, and that seems to me highly dangerous. Take, for instance, the Hadfield shell, which undoubtedly was the best armour piercing shell that had ever been made. Sir Robert Hadfield has sold his patent to other countries. Would you approve of that?

Sir Reginald Bacon: Certainly.

1665. *Sir Philip Gibbs*: It seems to me increasing our danger, whereas if we kept it to ourselves we could have that superiority?

Sir Reginald Bacon: Would you be prepared to pay Sir Robert Hadfield a sufficient amount of money for his shells to make it worth his while?

1666. *Sir Philip Gibbs*: I think so; yes.

Sir Reginald Bacon: Then you would grumble and say the cost is more than somebody else's! Hadfield was the only firm in England I had to do with that produced decent steel castings. Nearly every firm produced things like gorgonzola cheese. Hadfield was pre-eminent with his shell. But it is a fact that when we came to fight the battle of Jutland 50 per cent. of the shells failed.

1667. *Sir Philip Gibbs*: Probably that was due to bad material?

Sir Reginald Bacon: No. The only test of a shell is to fire it against armour plate and when you fire it against armour plate it has gone. We took one or two shells out of our cast and fired them against armour plate; if they succeeded we said the remainder were all right. You cannot test each shell.

1668. *Sir Philip Gibbs*: May I ask you this general question? Supposing there were a government monopoly of arms, do you think it would be more likely that we should keep very important secrets or improved inventions within our own hands?

Sir Reginald Bacon: As I say, there were, in my time as D.N.O., only about two secrets that are worth keeping. There are any number of confidential things.

1669. *Professor Gutteridge*: Was not the Brennan Torpedo one of the things?

Sir Reginald Bacon: The Brennan Torpedo. If you start me on that, I can go on for a long time! The Brennan Torpedo is a thing that could not run for more than 2,000 yards. It was all right in the old days, but the moment you got guns that could fire more than 2,000 yards, the Brennan went. I would infinitely sooner start with a clean sheet for all countries, everybody knowing what everybody else was doing; but you may find that other countries have got something up their sleeves.

1670. *Sir Philip Gibbs*: I am now going to put rather an argumentative question to you. You talk about the loss of trade to the country if the export

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

of arms were stopped and you say that it would work out practically to this, that it would deprive about 10,000 men of their work and wages?

Sir Reginald Bacon: Yes.

1671. *Sir Philip Gibbs:* But may I suggest to you that the increase of armaments might lead to a war, which would deprive millions of men of their work and wages.

Sir Reginald Bacon: No, Sir. The increase of armaments will stop war.

1672. *Sir Philip Gibbs:* It did not do so in 1914.

Sir Reginald Bacon: No. Why did we go to war in 1914? For one single reason, and that was that the English government were not in a position to say to Germany, "If you side with Austria, we will go to war."

1673. *Sir Philip Gibbs:* You say we had an inferiority in one or two branches but, broadly speaking, we had a slight superiority over them at that time.

Sir Reginald Bacon: Speaking generally, we had a bigger superiority than when I told you, because that was only one particular date. A month after, and a month before, we had more ships and our superiority was greater. I do not want to stress that. The point was this, that Germany, if she went to war with us, must lose the whole of her merchant shipping and her colonies. She would never have gone to war with us if we had been in a position to say to her that she must not side with Austria. The bigger the armaments, the less likely you are to have war.

1674. *Sir Philip Gibbs:* The argument on the other side is that if we increase either our naval or military armaments, some other country will immediately increase theirs; so you get this constant extension of increase which finally leads to collision.

Sir Reginald Bacon: The question is, does it lead to collision?

1675. *Sir Philip Gibbs:* It does not, from our point of view, as long as we remain absolutely supreme, but it is extraordinarily difficult for any country to remain absolutely supreme.

Sir Reginald Bacon: I cannot see any evidence in history that armaments have led to war.

1676. *Sir Philip Gibbs:* Can you not? I think I could produce a good deal; but it would take a long time.

Sir Reginald Bacon: We stopped four wars between 1879 and 1914 by being strong at sea, and if we keep strong at sea we will stop wars. Do you not think so, Sir?

Sir Philip Gibbs: No. I do not.

1677. *Sir Thomas Allen:* Following up your reply to a question put to you by Sir Kenneth Lee that many government factories would be uneconomical: Where does the economy arise in having distribution of our requirements over many factories now?

Sir Reginald Bacon: What sort, Sir?

1678. *Sir Thomas Allen:* Private factories. We spread our orders now over many factories.

Sir Reginald Bacon: By competition. Competition is the whole basis of reducing prices and getting efficiency.

1679. *Sir Thomas Allen:* Do you really believe that there is any competition? You have told us that you had to share out the work between Woolwich and Vickers and one other firm.

Sir Reginald Bacon: Yes.

1680. *Sir Thomas Allen:* Would you regard that as being competition?

Sir Reginald Bacon: No, Sir, I should not regard that as competition, not in the particular case of the heavier gun mountings, but that is why we brought Coventry along. If the War had not taken place in 1914, probably later Coventry would have got the lion's share of the orders and the other firms would have had them reduced.

1681. *Sir Thomas Allen:* You have also told us, with respect to sales abroad, we cannot have a government going out for orders. Yet you tell us, in your Notes, "A small country that obtains its armaments from another country is bound to it by very strong

ties." Do you not think the ties would be very much stronger if they were receiving their supplies from a national factory or from a government, rather than from private individuals?

Sir Reginald Bacon: Yes, I do, but the sentimentalism from which we suffer would ever prevent an English government supplying armaments to other powers. Common sense would say, "Do it," but our sentimentalism would never allow it.

Sir Philip Gibbs: I must intervene at that point to say that we did supply armaments to foreign countries. I am sorry, Sir Thomas.

1682. *Sir Thomas Allen:* Not at all. (*To the Witness:*) You have visualised to us the possibility of a shadow ministry that would be ready in the case of any emergency. Do you think we ought to wait for an emergency before we set up machinery of this kind?

Sir Reginald Bacon: Yes, I do. If you can have a shadow ministry that can be efficiently brought into operation within a few days—we will say a fortnight or so of the outbreak of war, and which costs perhaps only £10,000 to £15,000 a year—it is infinitely preferable to having a government manufactory which will have to expand enormously on the outbreak of war and which in peace time will cost you a very large sum of money owing to its reserve manufacturing capacity.

1683. *Sir Thomas Allen:* You have told us that if and when the shadow ministry comes to operate in time of war you feel that the three services should then be free to procure their requirements where they please.

Sir Reginald Bacon: Oh! no, sir. I think you misunderstood me. What I said was this, that you would be obliged to keep a portion of the contract department at the Admiralty and a portion at the War Office for matters with which the Ministry of Munitions did not deal. All the munitions would have to be ordered by the Ministry of Munitions, the same as they were during the War.

1684. *Sir Thomas Allen:* I ask you that because Dr. Addison was very emphatic on that point. He pointed out the necessity of unified responsibility to eliminate waste and loss of efficiency through the three separate services acting independently of each other, which they did previous to the setting up of the Ministry of Munitions.

Sir Reginald Bacon: I quite agree. There is no doubt about that.

1685. *Sir Thomas Allen:* You told us that the fact of Woolwich having no other work to fall back upon themselves, prevented the establishment being properly balanced. Would you agree that economy in any state factory depends upon two things—that it should be fed adequately with orders, or, failing being fed adequately with orders from within, it should be free to manufacture for some other purposes externally?

Sir Reginald Bacon: No, I do not think it is possible. I cannot visualise a government factory going round and undercutting the smaller manufacturers. You would have such a row that you would not be able to withstand it. Woolworths are had enough, scooping up all the small shops in the villages and towns, but if you had a firm backed by the whole wealth of the nation going round and undercutting private manufacturers—

1686. *Sir Thomas Allen:* Do you think Woolwich has ever had an opportunity of proving itself a business organisation?

Sir Reginald Bacon: No; because it will never get enough orders for its reserve capacity.

1687. *Sir Thomas Allen:* How can it get enough orders if the government system is to allocate orders on the lines that you have indicated to us this morning?

Sir Reginald Bacon: Because if they got the whole of the orders it would not be enough to make Woolwich pay—not with the reserve machinery. Dr. Addison never forecasted how much reserve

31 October, 1935.]

Admiral Sir REGINALD BACON, K.C.B., K.C.V.O., D.S.O.

[Continued.]

machinery you were to have, but if you were to have reserve machinery to compete at all with the conditions of the Great War the whole thing would be absolutely impossible.

1688. *Sir Philip Gibbs*: You would have to rely on the national factory?

Sir Reginald Bacon: Then do not have a factory. Have something which has proved itself most efficient, a shadow ministry which is able to take up the work left by the old Ministry.

1689. *Sir Thomas Allen*: We have been told in evidence that every chance has been given to private manufacture to keep going and that by reducing the output of the government arsenals and dockyards and by giving increased orders to private firms Woolwich has practically been starved. Would you agree to that?

Sir Reginald Bacon: No. As I said before, you cannot in peace-time give sufficient orders to Woolwich, if Woolwich is to be anything like the establishment that Dr. Addison has forecasted, to make it a financially sound concern.

1690. *Professor Gutteridge*: Would you call Lord Wester Wemyss a sentimentalist?

Sir Reginald Bacon: Yes, I should, to a certain extent.

1691. *Professor Gutteridge*: Did you see an official memorandum which he laid before the Admiralty in 1918? I think you were in France at that time.

Sir Reginald Bacon: In 1918 I was at the Ministry of Munitions.

1692. *Professor Gutteridge*: Have you Mr. Noel Baker's evidence before you?

Sir Reginald Bacon: Yes.

1693. *Professor Gutteridge*: If you look at paragraph 7 you will see an extract from Lord Wester Wemyss' memorandum:—"Apart from the moral objections to the present system, which makes warfare a direct occasion of private gain, the system is attended by the inevitable consequence that the multiplication of armaments is stimulated artificially." I do not want to read it all through. You might just glance at it. You see he concludes by speaking of a "subterranean conspiracy." That is the First Sea Lord of the Admiralty who is speaking, is it not? I should like your views on that.

Sir Reginald Bacon: I do not think my friend Lord Wester Wemyss knew anything at all about it. He was never in a private firm. He was simply repeating what lots of other people have said, that armament firms want war. I say from my experience that armament firms do not want war.

1694. *Professor Gutteridge*: You do not agree with him?

Sir Reginald Bacon: No, I do not agree a bit.

1695. *Professor Gutteridge*: I pass to something different. Perhaps you will agree with Sir Eustace d'Eyncourt. In the course of his evidence he said that wars were always won by the fellow who was a little bit ahead in armaments. Do you agree with that?

Sir Reginald Bacon: I would not agree with that at all. Venizelos said of England that we always won the last battle. Wars are very often won by those who strike first.

1696. *Professor Gutteridge*: Striking first might be a question of armaments.

Sir Reginald Bacon: It might be, but it depends on having the armaments ready. I think our great strength was due to Lord Fisher's insistence on having the Fleet instantly ready for war. It was not necessarily a question of size but it was instantly ready in all respects to strike.

1697. *Professor Gutteridge*: I think in addition to the Turkish warships that were building at the beginning of the War there were some ships building for some South American countries.

Sir Reginald Bacon: We were building some destroyers for Greece.

1698. *Professor Gutteridge*: Were not ships being built for the Chilians or the Brazilians?

Sir Reginald Bacon: I do not know. The only things fixed in my mind were the two battleships.

1699. *Chairman*: May I ask one question about the shadow ministry? I assume that your view of a possible shadow ministry would include some organisation which should keep an up-to-date and complete census of all available men and works and so forth.

Sir Reginald Bacon: Certainly.

1700. *Chairman*: That would not be shadow.

Sir Reginald Bacon: Oh! no. The paper information would all be there and the different firms would be notified, so that they would know exactly what was going to happen.

I only want to add this: I think Dr. Addison made a slight slip in regard to two things. One was about inventions by workers. He said the men did not get a chance, owing to the foremen. I think every reputable firm has a box in which any employee can put suggestions. They go before a small committee of the management, who decide whether they are worth anything. The other point was this, I think you said that thousands of inventions were sent in and very few were used. I have a paper there with the actual figures. Speaking roughly, during the War—I was Controller of Munitions Inventions at the end—47,624 suggestions were gone into, of which 226 were provisionally accepted for trial or adopted. Mind you, 226 in war-time is a great many. The point is that the whole of the 47,000 inventors, or the majority, were satisfied. It was the rarest thing to get a complaint. Practically speaking, the tank was the sole invention of Sir William Tritton and Major Wilson. The reason for the invention of tanks was simply this: I sat in 1918 on a committee which inquired into the question of tanks. People were groping after the idea of tanks up till almost the end of 1915. Then the idea suddenly struck some genius to write to the Royal Engineers Committee and ask them what they wanted the tank to do. It had never entered anyone's head to ask what the tank was required to do. The Committee said they wanted it to go over a 10-feet trench and up a 4-feet bank. If you take a piece of paper and put down those dimensions, you get the shape of the tank.

Chairman: Thank you very much, Sir Reginald.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TWELFTH DAY

Wednesday, 27th November, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKS, P.C., G.C.B. (*Chairman*).

Dame RACHEL E. CROWDY, D.B.E., LL.D.,
R.R.C.
Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.
Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.
Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Mr. W. B. BROWN, C.B., C.B.E., Second Secretary, Board of Trade;
Mr. C. HOWARD SMITH, C.M.G., Assistant Under Secretary of State, Foreign Office;
Mr. W. St. D. JENKINS, C.B., C.B.E., Director of Contracts, Admiralty;
Major C. S. NAPIER, R.E., General Staff, War Office;
Wing Commander C. E. H. MEDHURST, O.B.E., M.C., Directorate of Operations and Intelligence, Air Ministry;
Mr. A. E. SLATER, Principal, Air Ministry;
Mr. C. J. FLYNN, C.M.G., Commissioner of Customs and Excise;
called and examined.

1701. *Chairman*: I should like to make a short preliminary statement with regard to the object of this meeting, in order that we may decide the procedure. The object of the meeting is to ascertain the exact practice with regard to the granting of licences for the exportation of arms, using that word in a general sense. We have asked for information from the Government Departments on that point, and we have been supplied with a very full Memorandum* prepared by the Board of Trade in collaboration with the Foreign Office, the Admiralty, the War Office, the Air Ministry, and the Board of Customs and Excise. In so far as we, the members of the Commission, are concerned, we are satisfied that this Memorandum contains full information with regard to what the practice is, and what the law in regard to the particular matter also is. This Memorandum has been or will be supplied to the Press, and therefore, unless any of those gentlemen who are here representing the particular Departments would wish, either themselves to read the Memorandum which they have prepared, or to have it read, we, the members of the Commission, having studied it and read it, do not see the necessity of it being read. However, we are very much in the hands of those who are here from the various Departments. Would you wish it to be read, or are you content that it should be treated as read?

Mr. W. B. Brown: I think my colleagues and I would be quite content that it should be treated as read, if that suits the convenience of the Commission.

1702. *Chairman*: Then any questions that appear to be desirable will be asked by the members of the Commission, and the gentleman representing the particular Department will answer. You will decide amongst yourselves who should answer any particular question that is asked?

Mr. W. B. Brown: Yes. I think it will be obvious to us without any consultation which Department is concerned.

1703. *Chairman*: So far as I am concerned, the first question I want to put is this: It appears to

be the fact, from the information that you have supplied, that the Government are in a position to actually prohibit the exportation of any kind of arms or munitions. That is the present state of the law?

Mr. W. B. Brown: Yes.

1704. *Chairman*: They can do it if they wish?

Mr. W. B. Brown: Yes.

1705. *Chairman*: It is entirely within their discretion whether they would prohibit all exportation or some particular branch of exportation?

Mr. W. B. Brown: Yes.

1706. *Chairman*: Then there are two forms of licence which are adopted—I am not now speaking of the Admiralty. There is the open licence and there is the restricted licence to some particular articles. That is right, is it not—there are the two forms?

Mr. W. B. Brown: There is the open general licence and the particular licence for particular articles.

1707. *Chairman*: In the first part of the Memorandum, which is headed, "History of the Control of Exports of Arms from the United Kingdom", there is given a statement of what the law is and what the proposals under the various Traffic Conventions have been, some of which have been ratified and some not, apparently, and as to the course of procedure which should be followed. Then in paragraph 18 it says: "From the foregoing it will be seen that His Majesty's Government have so far as concerns the licensing of arms, munitions and implements of war, amended their regulations as necessary from time to time so as to be in a position to give effect to the international arrangements which have been either in prospect or actually put into operation." Is that quite accurate? With regard, for instance, to the question of publicity, in the last American proposal with regard to the trade in arms a great point is made about publicity. Do we in this country insist upon publicity now to the extent which is indicated in that last proposal?

Mr. W. B. Brown: No, not at present.

1708. *Chairman*: Then it is not quite accurate to say that you have amended your regulations from

* Appendix I.

27 November, 1935.]

[Continued.]

time to time so as to be in a position to give effect to the international arrangements which have been either in prospect or actually put into operation?

Mr. W. B. Brown: In that paragraph we were dealing with the licensing of arms. Perhaps when we drafted that we were thinking of publicity as almost a separate subject.

1709. Chairman: I see. Then the next part of the Memorandum is headed "Control of Exports of War Material in the United Kingdom" Paragraph 20 says: "The Board of Trade powers to regulate the export of arms from the United Kingdom are derived from Section 8 of the Customs and Inland Revenue Act, 1879, as amended and extended by Section 1 of the Exportation of Arms Act, 1900, and Section 17 of the Finance Act, 1921," and you set out in Annex A the provisions of the statutes and you refer to them; but I do not find anything in the statutes which refers to the granting of licences. The statutes only provide, do they not, for a prohibition of export? It seems to me to be assumed, from the fact that prohibition is possible, that the licensing system, as it were, is evolved out of that. There is nothing until you get to the Export Prohibition Order of 1931 which mentions licences, is there?

Mr. W. B. Brown: That is so. I am afraid I cannot tell the Commission exactly the origin of the licence system. It was instituted in the War period, and our records do not show the discussions which took place at the time. As you say, the Order in Council of 1931 expressly states that prohibition shall not apply to any exportation or shipment expressly permitted by a licence given by the Board of Trade; but we have hitherto been informed that we have the power.

1710. Chairman: I think I am right in saying that the first mention of granting a licence is found in that Arms Export Prohibition Order of 1931?

Mr. W. B. Brown: The 1921 Order in Council, I think, mentions the system of licences.

1711. Mr. Spender: Was there a separate Order in 1931?

Mr. W. B. Brown: Yes.

1712. Professor Gutteridge: That is the principal Order, I think, under which you work, is it not?

Mr. W. B. Brown: Yes. That is the Order under which we are operating now.

1713. Chairman: With regard to the system generally, the three Departments that are concerned, apart from the Admiralty for the moment, are the Foreign Office, the Board of Trade, and the Customs and Excise?

Mr. W. B. Brown: Primarily.

1714. Chairman: And the application for a licence is made in the first instance to the Board of Trade, is it?

Mr. W. B. Brown: That is so.

1715. Chairman: Are the Board of Trade under any statutory obligation to consult anyone else except themselves, or is it merely a matter of practice that they go to the Foreign Office?

Mr. W. B. Brown: Merely a matter of practice; there is no statutory obligation, but it has been laid down for us that we always must do it, merely by an act of the Government.

1716. Chairman: Have the Government issued any instructions to the various Departments as to how the working of this system is to be carried out, or has it grown up, as it were?

Mr. W. B. Brown: I think it has "just grown".

1717. Chairman: Is it competent for the Board of Trade, and do they in fact sometimes issue licences on their own motion without consulting the Foreign Office, if they think it is a case in which the Foreign Office are not likely to be concerned?

Mr. W. B. Brown: In the case of things which are not war material within the strict definition, we do; but with regard to things which are properly war material we invariably consult the Foreign Office.

1718. Chairman: When you speak of war material, that raises another point. Is it merely the manufactured article that you consider when the applications for licences are made, or is an application for a licence necessary for the raw material?

Mr. W. B. Brown: Not the raw material; but component parts are in some cases identifiable as war material.

1719. Chairman: But they must have arrived at a stage of being identifiable as munitions?

Mr. W. B. Brown: That is so.

1720. Professor Gutteridge: Have you any list which you work on, or anything of that kind?

Mr. W. B. Brown: Yes. I could if necessary supply the Commission later on with details on that point.* There is a list of the different categories of prohibited goods, and which of those are war material proper.

1721. Professor Gutteridge: I think that is somewhat important.

Chairman: For instance, are any instructions available to an exporter as to what it is necessary that he should apply for a licence for; because you told us that when an article has arrived at a stage when it clearly can be seen to be a munition, then the exporter will know?

Mr. W. B. Brown: Yes.

1722. Chairman: And he will then apply for a licence; but are there any rules laid down and published which would guide exporters as to the articles with regard to which they must apply for a licence?

Mr. W. B. Brown: There is the Order itself; I do not know whether that is really sufficient for the ordinary exporter, but our experience is that exporters in fact visit us at the Board of Trade and make many inquiries before accepting orders, because there is a fear that they may find that the goods are in fact war material and are prohibited.

1723. Chairman: That raises a question that I wanted to ask you about, and that is this: Whether or not exporters do come to ask for information before they accept an order; first of all, as to whether or not the order is one which would require a licence for export, and also as to whether or not the order is one in respect of which a licence for export would be granted?

Mr. W. B. Brown: Very frequently; and that is one reason, I think, why the number of refusals of licences may appear rather small; because in many cases the exporter has made inquiries beforehand and found that it was an order that he would not be allowed to fulfil, and therefore he does not apply for a licence.

1724. Chairman: We have been told that, in the view of a great many people, the application for permission (if I may use that expression) should arise at an earlier stage, and that a licence should be required in respect of any order which is given, and the application not confined merely to the licence for export—that the permission in an official form should be issued at an earlier stage. Do you see any objection to that?

Mr. W. B. Brown: I think that the manufacturers themselves at present would not think that it was necessary, inasmuch as in the first instance they are fairly familiar by now with the procedure, and they do not in fact accept an order for manufacture without finding out whether they will be or are likely to be allowed to carry out the order by completing the export.

1725. Sir Thomas Allen: Would Mr. Brown elucidate this matter by saying whether the orders are accepted and the goods made by the manufacturer before the licence is given, or do they come along actually after the manufacture?

Mr. W. B. Brown: No; the manufacturer comes for a licence generally, in fact invariably, before he accepts an order from a foreign government, and he may get a licence; and sometimes

* See Appendix III.

27 November, 1935.]

[Continued.]

some of our licences may not exactly correspond with the final export, because he may come and ask for a licence and then not get the order after all.

1726. *Sir Thomas Allen*: There is a fresh licence for each specific order?

Mr. W. B. Brown: He generally applies for the licence at the moment at which he is thinking of tendering for the order, and he applies for it in respect of the order for which he is tendering.

1727. *Chairman*: If the general practice appears to be that exporters do take the precaution of coming to ask before they accept an order, it would not seem to be likely to hamper trade for that to be made compulsory, would it?

Mr. W. B. Brown: I do not see any serious objection *prima facie*.

1728. *Mr. Spender*: Have you provision, for cases in which licences have been granted and orders executed, for withdrawing the licences in the event of foreign complications, and so on?

Mr. W. B. Brown: All licences can be revoked at any time with or without reason given.

1729. *Mr. Spender*: So the manufacturer has to take that risk?

Mr. W. B. Brown: He is aware that it may be revoked, for instance, for reasons of Imperial security or because of any international agreement into which His Majesty's Government may have entered or may enter during the currency of the licence.

1730. *Dame Rachel Crowley*: I should like to ask a question in connection with that. In paragraph 35, you say: "The number of licences refused is small but this is to be expected as the suppliers well know the position and accordingly do not apply for licences where they know they will not be granted. Apart from this the Service Departments have a close understanding with the manufacturers, which enables them effectively to control the export of arms which might be prejudicial to Imperial security without recourse to the licensing system." When it is not a question of Imperial security, but a world situation in which we are not at the moment particularly involved, have you any right at all to suspend the granting of a licence or to hold your hand for the moment until you have inquired into the world situation?

Mr. W. B. Brown: I think so. Some of the licences to manufacturers of war material are described as liable to be revoked at any time for reasons of Imperial security or by reason of any international agreement into which His Majesty's Government may enter.

1731. *Dame Rachel Crowley*: That would really mean an embargo, would it not?

Mr. W. B. Brown: Yes.

1732. *Secretary*: Presumably "Imperial security" is capable of almost unlimited width of interpretation?

Mr. W. B. Brown: I think it is a term which becomes wider in its interpretation daily.

1733. *Mr. Spender*: In that case you would consult the Foreign Office?

Mr. W. B. Brown: Before the licence is issued, certainly.

1734. *Chairman*: May I go back to the point I was on just now? I asked you whether or not applications for licences should be made before the order is accepted. There is another point which has been made before us, and that is the question of publicity, and it has been said that it would be a matter of great advantage if full publicity were insisted upon in reference to any licence that was applied for and granted. Do you see any objection to publicity of licences for orders if that system was introduced; do you think it would be of any use, or do you think it would be objectionable?

Major C. S. Napier: I think we have to bear in mind the whole time the question of foreign competition. Publicity would inevitably place our own manufacturers at a serious disadvantage in

relation to their foreign competitors. I think that objection also applies, to a certain extent, to your suggestion that applications for licences should be required to be made before the order is accepted, or even before it is tendered for; because very often foreign governments place their contracts at rather short notice; their need may be serious; and anything which hampers our own manufacturers in tendering usually means simply that the order is placed elsewhere.

1735. *Chairman*: There is another question which I should like to ask with regard to publicity, and that is this: Of course, the suggestion has been made with reference to publicity that it might have the effect of restricting the manufacture and exportation of arms, but it has occurred to me that if publicity was given to an order placed, we will say, by Government A, might that have the effect of inducing Government B to say: "Well, now: A is placing an order for this quantity of arms, or this improved form of arm; we must do the same; we cannot be behindhand", and therefore the effect really might be the contrary to what is anticipated; it really would result in an increase in the manufacture of arms rather than the opposite?

Major C. S. Napier: There is that possibility, and there is also what I rather fear: that Government A would simply not place its order in a country where publicity is given to the state of its national defence.

1736. *Dame Rachel Crowley*: That would not apply if it was under international agreement?

Major C. S. Napier: No. We have no objection to universal action.

1737. *Chairman*: With regard to the general practice, is it left to each Department to exercise its own discretion in reference to the granting of licences, or is there any defined policy laid down by the Government with regard to the lines on which they should proceed?

Mr. C. Howard Smith: There is no definite policy laid down, I think; but in a case in which there is an application to export to a foreign government, or abroad, the Board of Trade naturally refers it to the Foreign Office, in case the Foreign Office might think, for reasons of policy, that the particular consignment should not go to the particular country. This is as far as the Foreign Office comes into it.

1738. *Chairman*: But the general policy seems to be not to discourage the granting of licences, but only to refuse them where there is some definite, obvious reason why they should not be granted?

Mr. C. Howard Smith: Yes, I think that is correct.

1739. *Chairman*: The policy is to grant them, and only to refuse them in definitely clear cases?

Mr. C. Howard Smith: Not to interfere with the trade more than is necessary.

1740. *Chairman*: That is perhaps a better way of putting it. You do not wish to interfere with the trade more than is necessary.

Sir Thomas Allen: Is the encouragement of the trade beneficial to our Services?

Major C. S. Napier: I do not think you can say that we encourage the trade, but I think your point is that we do not discourage it. I again say that what we have to consider the whole time is our relative position in relation to foreign powers. After all, the arms trade is at the moment an element in our national security.

1741. *Sir Thomas Allen*: I was wondering whether it was in the minds of the three Services that the more export trade we do the more efficient we would be at a time of emergency to produce for ourselves?

Major C. S. Napier: I think we can say that it is in our minds; but, if you agree, I would suggest that that falls under the major heading of the Terms of Reference, on which you will be taking evidence later.

27 November, 1935.]

[Continued.]

1742. *Chairman*: Yes; it will fall under that head. We want, as far as we can, to confine ourselves to-day to the practice rather than to the policy. With regard to the Customs and the open general licence: to what extent do the Customs endeavour to ascertain whether there is any evasion of the rule about the exportation of arms under this system of the open general licence?

Mr. C. J. Flynn: Where there is an actual open general licence in existence the exportation is covered as far as the Customs are concerned.

1743. *Chairman*: I suppose it is possible, unless there is a certain amount of examination, to evade the provisions with regard to licensing in the case of munitions if a person chooses to attempt to evade them?

Mr. C. J. Flynn: All goods exported whether subject to prohibition or not are liable to examination before shipment, and our officers do examine occasional packages to check evasion.

1744. *Chairman*: You used the word "occasional," and you use that in the Memorandum?

Mr. C. J. Flynn: Yes.

1745. *Chairman*: To what extent is that done? Is it done systematically, sufficiently to bring home to the exporters that it is being done, or is it an occasional, casual examination?

Mr. C. J. Flynn: It is very difficult to say what is sufficient to bring home to the exporters what is being done, but it is a regular system. As regards exports covered by Board of Trade licence the position is that the packages must be produced to the Customs Export Officer before shipment. As regards other exports we have general powers which enable us to require any package which is shipped or about to be shipped to be opened for Customs examination and we do exercise those powers to see that the prohibition is not abused. Goods not requiring pre-entry are dealt with under those powers and consequently our statement that documents are only required within six days of the clearance of the vessel does not mean that such goods are never examined.

1746. *Professor Gutteridge*: I am not asking for any details, but have cases occurred in which you have examined packages and found them to contain prohibited articles?

Mr. C. J. Flynn: Yes, but very rarely. Of course, the inducement at present is not very serious. It must be remembered that an exporter is running a very grave risk if detected, because the penalties are very severe.

1747. *Chairman*: Do you think that the present system is satisfactory—I mean with regard to the possibility of evasion and the possibility of the examination of goods under this open general licence? Do you think the present system is satisfactory, or do you think it is possible to tighten it up in any way?

Mr. C. J. Flynn: I think it is reasonably satisfactory. It is extremely difficult to tighten the present system in any way which will not very seriously interfere with our export trade. The only method would be more intensive examination of packages which are brought for shipment, and it must be borne in mind that the bulk of trade is perfectly innocent, and the trader would naturally resent his packages being opened for what he considers no purpose.

1748. *Chairman*: That is the only possible alternative, namely, more intensive examination?

Mr. C. J. Flynn: I think so; unless it were found possible to control the position either at the factories or at the dealers, or at both. But, so long as control is exercised at the point of exportation, any tightening of the present system would, I think, involve a more stringent examination of exported goods.

1749. *Chairman*: Speaking generally, do you think

the present system, having regard to all the difficulties with regard to exporters, and so forth, is sufficiently stringent?

Mr. C. J. Flynn: I think it is. I think it is reasonably adequate for present purposes. Of course, in periods of emergency special precautions are taken—for example, in the present Italian position, all goods going to Italy are pre-entered.

1750. *Dame Rachel Crowdy*: Do any of the officials here to-day also deal with the drug traffic—do they deal with all the export certificates or licences?

Mr. W. B. Brown: No.

1751. *Dame Rachel Crowdy*: Do any of you know the licensing system applied to dangerous drugs in Great Britain?

Mr. W. B. Brown: I am afraid I do not.

1752. *Dame Rachel Crowdy*: Under that system, if a licence is issued for the export of drugs, the licence is only issued when the importer in the importing country gives a certificate from his government that those drugs are being received with the knowledge and consent of the government. Of course, in the case of drugs it says for medical and scientific purposes; that is a different thing. Do you feel that it would strengthen the application of your licensing system if something of that sort were introduced in connection with arms? It seems such an obvious analogy.

Mr. W. B. Brown: The export of war material is normally to governments already; the government is the consignee.

1753. *Dame Rachel Crowdy*: But is it always?

Mr. W. B. Brown: There are some exceptions—the Police Force in Shanghai, for instance; that is really a government, although it has not all the powers of a government. The war material ordered is not shipped to private individuals; and that in fact was the reason for the continuation of these powers after the War to stop war material ordered from getting into the hands of private sections or factions. There are in fact certain countries where we do require the production of a certificate from the government to which the material is consigned, but that is done at the request of those particular governments.

1754. *Dame Rachel Crowdy*: You never get a case in which our manufacturers, for example, ship to manufacturers in other countries, possibly to give them to a third country?

Mr. W. B. Brown: It does happen, but we make inquiries as to the ultimate destination, as far as we can, before we issue the licence.

1755. *Dame Rachel Crowdy*: If you found that the inquiries led to rather a suspicion in your mind, you would probably not grant the licence?

Mr. W. B. Brown: That is so.

1756. *Dame Rachel Crowdy*: You answered a question indirectly as to whether the officials here to-day see any gap in the existing licensing system, and your answer, I understand, was more or less "No"?

Mr. C. J. Flynn: Yes. I think it is reasonably satisfactory. I think I can say that any large or extensive shipment would certainly be detected. It is impossible to say that a separate package or a rifle could not be exported.

1757. *Sir Kenneth Lee*: We have had it stated in evidence that it is a fact that armament firms are free to export raw material and partly finished material which their associate firms abroad can assemble there?

Mr. W. B. Brown: That is so.

1758. *Sir Kenneth Lee*: Without any restrictions?

Mr. W. B. Brown: There is a restriction on certain component parts which are specified.

1759. *Professor Gutteridge*: Where are those specified?

Mr. W. St. D. Jenkins: In the Order in Council of 1931.

1760. *Sir Kenneth Lee*: Except for those component parts there is nothing to prevent other parts being shipped abroad?

27 November, 1935.]

[Continued.]

Mr. W. B. Brown: That is so. They would very probably be component parts which it is very difficult to identify as parts of war material.

1761. *Sir Kenneth Lee*: In paragraph 22 you say: "The licence provides that the owner or shipper shall, if required by the Customs, produce proof that the goods were duly delivered at the destination named in the licence." Is it customary to require proof?

Mr. C. J. Flynn: We have on occasions required proof in cases of suspicion; but we can only call for proof of destination; that is to say, proof that the goods have reached the port to which they were consigned. That is not, of course, proof that they have not reached a prohibited area. The only evidence we get is a certificate of landing at the foreign port to which the goods were consigned. That normally is a certificate signed by the Customs Administration of the importing country.

1762. *Sir Kenneth Lee*: Then the goods could afterwards be delivered to third parties?

Mr. C. J. Flynn: Yes; unless, of course, the importing country is exercising some prohibition itself.

1763. *Sir Kenneth Lee*: It has also been said that chemicals in the military sense as elements required for explosives manufacture are not now included in the licensing system?

Mr. W. B. Brown: That is so.

1764. *Sir Kenneth Lee*: Can you say why they were excluded?

Mr. W. B. Brown: It is a question on which I cannot express an opinion as to how far our present powers go—whether those powers would enable us to control all the ingredients of explosives. I am pretty sure they would not. To go further and impose a prohibition and require a licence for the export of many commodities which are used for ordinary purposes of commerce to a much greater extent than they are ever used for war purposes, would be a very serious interference with the ordinary trade of the country.

1765. *Sir Kenneth Lee*: It would be a matter of inconvenience if they were included?

Mr. W. B. Brown: I think so. I doubt whether we have the power. The power may extend to gases, but I do not think the power would extend to raw materials.

1766. *Chairman*: When you are speaking of powers you are referring to the question to which Sir William Jowitt referred us, as to whether or not these particular articles or materials come within the terms of the prohibition?

Mr. W. B. Brown: Of the Customs Act?

1767. *Chairman*: Of the 1931 Order in Council.

Mr. W. B. Brown: It is a question whether this comes under the original statute.

1768. *Sir Kenneth Lee*: In Annex I,* paragraph 2, there is a statement which says: "... an agreement has been made with the industry which ensures that the firms notify the Air Ministry whenever a foreign order is in contemplation." Could we have a copy of that agreement?

Mr. Slater: That agreement is a confidential document, but I could send a copy to the Commission.

1769. *Mr. Spender*: There is nothing to prevent neutral commodities being brought within the scope of the prohibition. Take the case of petrol; you do not need a special Act of Parliament to bring that in?

Mr. W. B. Brown: I think we should. You have in mind the special case of the prohibition of exports to Italy, which is under the Treaty of Peace Act of 1919. We are able to do that as a result of decisions at Geneva which are part of the carrying out of the Treaty of Peace, and therefore we have powers under that Act.

1770. *Mr. Spender*: Otherwise you would want a special Act of Parliament?

Mr. W. B. Brown: I think so.

1771. *Mr. Spender*: It is your view generally, as I understand it, that these safeguards could not be very greatly improved except by international agreement?

Mr. W. B. Brown: Yes.

1772. *Mr. Spender*: Then we should get into a different region?

Mr. W. B. Brown: Yes.

1773. *Sir Thomas Allen*: We have been told that we have the strictest licensing system in the world. What I would like to ask is: Have we suffered in our exports because of our superior efficiency in respect of control?

Major C. S. Napier: I think I may say that we have suffered. It is rather a delicate subject.

1774. *Sir Thomas Allen*: And the strengthening of our licensing system at home, unless that was agreed internationally, would further handicap us?

Major C. S. Napier: Yes. We have always to consider what foreign nations are doing on the same lines.

1775. *Professor Gutteridge*: I take it you have power to give a pretty wide interpretation to the term "munitions of war", have you not, as used in these various enactments? What I am trying to get at is this: I notice there is a list scheduled to the Order in Council of 1931, and I was wondering how far you regard that as imposing a limit upon you, or whether in appropriate circumstances you would interpret "munitions of war" rather more widely than it is interpreted in that schedule?

Mr. W. B. Brown: It would be possible to interpret it still more widely.

1776. *Professor Gutteridge*: Would it be possible to bring poison gas in under that, do you think?

Mr. W. B. Brown: Yes; and there is at present a prohibition on the export of poison gas to Italy.

1777. *Professor Gutteridge*: Now another matter; I do not know who is the appropriate person to tell me this, but what about exports to the Dominions and other parts of the British Empire?

Mr. W. B. Brown: They go under licence.

1778. *Professor Gutteridge*: Do you deal with them in exactly the same way as you would with exports to foreign countries?

Mr. W. B. Brown: No. The licence is merely a formality; they have to have a licence to be produced for the satisfaction of the Customs, but it is just a formality.

1779. *Professor Gutteridge*: Do you make any inquiries as to what is likely to happen to them when they get there, if there is any possibility of re-export?

Mr. W. B. Brown: They are consigned to a Dominion Government, and it would be difficult for us to inquire.

1780. *Professor Gutteridge*: I follow that. They are not consigned to individuals, of course?

Mr. W. B. Brown: No. The applications in fact are made in London by the High Commissioners for the Dominions concerned.

1781. *Professor Gutteridge*: That answers my question.

Mr. W. St. D. Jenkins: And the Crown Agents I believe.

1782. *Professor Gutteridge*: I should like some more information with regard to what happens when munitions are shipped; I should like to know more about the system. When do the goods have to be entered?

Mr. C. J. Flynn: The prohibited goods?

1783. *Professor Gutteridge*: Yes.

Mr. C. J. Flynn: They have to be entered before they can be shipped.

1784. *Professor Gutteridge*: That is, before they are actually taken down to the ship's side?

Mr. C. J. Flynn: Yes. Goods which are subject to prohibition have to be entered with the Customs, and the licence produced in the ordinary way. The exporter will go to the Customs Office and produce his documents with his licence; the licence is there examined and sent down to the dock station, where the goods are being exported; there the goods

* Appendix 1, p. 340.

27 November, 1935.]

[Continued.]

must be produced to our officer, who is constantly going backwards and forwards checking goods for drawback, export under bond and so forth, and the shipment has to be actually certified by our officer.

1785. *Professor Gutteridge*: But if anyone arrived with a case labelled (say) "Jam", containing machine guns, he might get it passed?

Mr. C. J. Flynn: It is possible. It would depend entirely on the vigilance of the officer. I should explain that these officers are engaged all day and every day on this particular work, and they are naturally familiar with the ordinary run of trade; they know the types of packages in which particular goods are packed, and their normal destinations, and if anything arrived of an unusual kind or in unusual quantities it would undoubtedly excite the officer's suspicion.

1786. *Professor Gutteridge*: There are obviously some goods which could not be smuggled out of the country?

Mr. C. J. Flynn: Yes. You could not very well take a tank out without the officer seeing it; and I think it is true generally that you cannot have any considerable exportation without attracting the officers' attention.

1787. *Professor Gutteridge*: Things like hand grenades and rifles, and so on, could be smuggled, possibly?

Mr. C. J. Flynn: Yes, they could possibly be, but not in large quantities. A man might have one in his baggage and it might not be noticed.

1788. *Professor Gutteridge*: You mean, if you had an abnormal number of packages coming along of a certain kind you would begin to get suspicious, probably?

Mr. C. J. Flynn: Certainly—or of an unusual character.

Major C. S. Napier: May I advance a remark on the subject of poison gas, to which you were referring a moment ago?

1789. *Professor Gutteridge*: Yes.

Major C. S. Napier: I should like to sound a note of caution as regards the present embargo on poison gas to Italy. That is a specific case; but it must be remembered that many poison gases have legitimate industrial uses. In the case of Italy it does not matter if we err on the side of restricting perfectly legitimate trade, but one ought not to jump to the conclusion that one could immediately apply the same embargo generally without reaction on legitimate chemical trades.

1790. *Professor Gutteridge*: I follow that. I think that, as far as I can see, the schedule to the 1931 Order seems to cover component parts of most lethal weapons, does it not?

Mr. W. B. Brown: I think so.

1791. *Professor Gutteridge*: I have just been looking at it. It has a very wide scope, I think. I do not know whether there is a Service representative who could bear that out. I think that list would cover most component parts, would it not?

Major C. S. Napier: Yes.

1792. *Professor Gutteridge*: It is rather difficult to think of anything which it would not cover really.

Mr. Slater: It does not cover component parts of aircraft, of course.

1793. *Professor Gutteridge*: Aircraft components are not covered by it?

Mr. Slater: No; not by the Order.

1794. *Professor Gutteridge*: There is nothing to prevent aircraft being exported so long as they are not of definite military design?

Mr. Slater: The position there is that aircraft do not require a licence unless they are definitely armed.

1795. *Professor Gutteridge*: That means fitted with bombs and machine guns?

Mr. Slater: Yes.

1796. *Professor Gutteridge*: Supposing you had a plane which was in fact a military plane, but the guns, and so forth, were not fitted to it, would it be possible to export it?

Mr. Slater: We ourselves control that, as explained in our statement.

1797. *Professor Gutteridge*: You would probably raise objections?

Mr. Slater: We should say whether it could go or not.

1798. *Professor Gutteridge*: Because otherwise it occurs to me that there is a way of evading the whole matter by first of all exporting the plane and then exporting the armaments.

Mr. Slater: We control the export through our arrangements with the firms of all kinds of aircraft except purely civilian aircraft.

1799. *Professor Gutteridge*: Have you endeavoured to control the export of engines and engine components at all?

Mr. Slater: Engines, but not engine components.

1800. *Chairman*: I wanted to ask a question about aircraft, but I omitted to do so. The question I wanted to ask was the one which was indicated by *Professor Gutteridge* just now, because one of the witnesses whom we have heard referred to this fact, or alleged fact, in these terms: "When the United States Senate Committee on Foreign Affairs was inquiring into the proposed embargo on war materials in 1932 it was stated in evidence (a) that European armament firms were sending high-class fighting aircraft to the Canton Government, leaving off the machine guns and calling them commercial planes, and (b) that armament firms were sending to China planes specified as civil, but were sending by post the blue prints indicating how these could be converted into military planes." Has anything of the kind occurred in this country? Has there been any instance of exporting a military plane without the guns, and then sending the guns separately?

Mr. W. B. Brown: Unless the Air Ministry could say, I do not think we have any knowledge of any such thing; but I would point out that the aeroplane, if it were fitted with gun mountings or with bomb racks or with interrupter gear, would be subject to licence, and, of course, the subsequent export of armaments for the aeroplane would also be subject to licence.

1801. *Professor Gutteridge*: In other words, it would be impossible for that situation to arise without a licence becoming necessary?

Mr. W. B. Brown: That is so.

1802. *Professor Gutteridge*: Perhaps the representative of the Air Ministry would like to answer that question?

Mr. Slater: The arming of an aircraft would include not only the actual guns, but also the arrangements for fitting the guns; not only the bombs, but the arrangements for dropping the bombs. If those are on the aircraft, the aircraft requires a licence. When they are not, then the aeroplane is subject to our unofficial control.

1803. *Professor Gutteridge*: But you would not regard the ordinary commercial plane as a thing which was adaptable to warlike purposes?

Mr. Slater: I think, to a greater or less degree, any aircraft is adaptable to military purposes.

1804. *Chairman*: We have had a considerable difference of opinion about that. Some witnesses say that a purely commercial aircraft cannot be adapted, whereas others say it can. Your view is that they could be adapted, or, at any rate, used?

Mr. Slater: Yes, but I am only giving my personal opinion.

1805. *Mr. Spender*: It has been put to us that it is growing more difficult every month; that the new types of military aircraft are such that the conversion of commercial aircraft becomes more difficult. Is that so?

Wing-Commander C. E. H. Medhurst: The term "military use" has a very wide interpretation. If one takes the conveyance of troops behind the battle-front, or of petrol for aeroplanes which are going to fight, this would be "military use", and

27 November, 1935.]

[Continued.]

any commercial aeroplane could be used for that sort of work, although it would not be a military aeroplane in the true sense of that term.

1806. *Professor Gutteridge*: We have been told that it is impossible to drop bombs from an ordinary commercial plane. Anyone could throw a Mills hand grenade overboard from a plane, but the result from the military point of view would be nil. Effective bomb dropping is impossible from a commercial plane. Do you agree?

Wing-Commander C. E. H. Medhurst: Definitely, unless it is fitted properly as a bomb-dropping aeroplane, which would require many major modifications.

1807. *Professor Gutteridge*: And they would be obvious modifications which would be detected?

Wing-Commander C. E. H. Medhurst: Yes.

1808. *Sir Thomas Allen*: We have been told that any civil plane can be converted to that purpose within six or eight hours. Would you disagree with that?

Wing-Commander C. E. H. Medhurst: Definitely.

1809. *Chairman*: The present system with regard to aircraft and licensing is really a matter of voluntary arrangement, is it not, between the Government and the various manufacturing firms?

Mr. Slater: Yes, that is so.

1810. *Chairman*: It is a purely voluntary arrangement assented to, I suppose, by the firms?

Mr. Slater: I would rather put it that we imposed it on the firms and they have accepted it.

1811. *Professor Gutteridge*: So far as vessels of war are concerned, the system is somewhat different, is it not?

Mr. W. St. D. Jenkins: That is so.*

1812. *Professor Gutteridge*: That comes under the Foreign Enlistment Act, does it not?

Mr. W. St. D. Jenkins: The Treaties of Washington Act.

1813. *Professor Gutteridge*: I see that somewhere in the Memorandum the question is raised as to whether similar provisions might not apply to the case of aeroplanes. It is suggested that Section 11 (I think it is) of the Foreign Enlistment Act might apply to aeroplanes?

Mr. Slater: I think that is rather a doubtful point.

1814. *Professor Gutteridge*: It is Section 3. (Extract read.) Is that because hydroplanes might conceivably be considered as ships, or what was in the mind of the person who compiled the Memorandum and made that statement? It rather interests me.

Mr. Slater: My information is that Sections 8 to 10 of the Foreign Enlistment Act definitely do not apply to aircraft; and that the application of Section 11 is doubtful.

1815. *Professor Gutteridge*: I have always held the view myself that a hydroplane is not a ship. I suppose it is based on that, is it?

Mr. Slater: I think it is quite definite that a seaplane is not a ship.

1816. *Professor Gutteridge*: It might conceivably be a case for the extension of this principle to aeroplanes; you might have a case of an expedition being fitted out in the same way that arises with vessels of war?

Mr. Slater: That is Section 11, I think.

1817. *Professor Gutteridge*: Yes. Section 11 is wide enough to cover aeroplanes, is it not? "If any person within the limits of Her Majesty's Dominions and without the licence of Her Majesty's Government prepares or fits out any naval or military expedition"—that is not likely to happen, but there is a possibility?

Mr. Slater: Yes; I think that certain expeditions might come within that. I think the

application is doubtful. We should require to look at the particular circumstances.

1818. *Professor Gutteridge*: The thought crossed my mind as to whether it was possible there might not be a case for the extension of the same sort of principle to aeroplanes as to ships, but it is rather difficult to see how it could arise.

Mr. Slater: I think we meet that point by our present arrangements. We do in fact exercise that control by our agreement.

1819. *Professor Gutteridge*: But your control rests upon this agreement, does it not?

Mr. Slater: Yes.

1820. *Professor Gutteridge*: Have you any means of knowing what goes on in aircraft factories?

Mr. Slater: Yes. We have Air Ministry personnel permanently stationed there.

1821. *Professor Gutteridge*: Is that at each aircraft factory?

Mr. Slater: At each main aircraft factory there is a resident technical officer and a resident inspector.

1822. *Professor Gutteridge*: They are Air Force officers, I suppose?

Mr. Slater: No; civilians.

1823. *Professor Gutteridge*: Servants of the Ministry?

Mr. Slater: Yes.

1824. *Dame Rachel Crowdy*: With regard to the question of occasional search to which you referred, what exactly was that?

Mr. C. J. Flynn: The occasional examination of packages.

1825. *Dame Rachel Crowdy*: Have you any particular periods of time when search is made, or is it only when you are suspicious or when the officer feels like searching, or what?

Mr. C. J. Flynn: It is really left to the discretion of the Customs officers.

1826. *Dame Rachel Crowdy*: It is arbitrary?

Mr. C. J. Flynn: No; it is covered by law; but it is left to the discretion of the officer, and where his suspicions are aroused he will examine.

1827. *Dame Rachel Crowdy*: Probably only when suspicious?

Mr. C. J. Flynn: Probably; but he is required to do it occasionally in any case as a record that he is carrying out his instructions.

1828. *Dame Rachel Crowdy*: You mentioned that you thought the manufacturers would object very much if there was a much stiffer system of search. Are you right in that; because, after all, there has been no objection to the new measures with regard to searching for dangerous drugs—opium and morphine consignments, for instance; that has been accepted by the drug manufacturers. Do you think it would not be acceptable to the armaments manufacturers?

Mr. C. J. Flynn: I was not thinking of the armaments manufacturers; I was thinking about the traders in other goods. It is not the armament goods only which have to be examined. Goods which are absolutely innocent have to be examined in case they may contain prohibited goods.

1829. *Dame Rachel Crowdy*: That applies equally to drugs, does it not? Do you think that there would be an outcry if it was applied to armaments?

Mr. C. J. Flynn: I am afraid that any considerable increase in the examination of goods would mean a great delay of the export trade.

1830. *Dame Rachel Crowdy*: It would hold up ships?

Mr. C. J. Flynn: Yes. The exporter's goods have to be held up while they are being examined, and it may be that the goods are specially packed, with the result that he has to send a packer to re-pack them when we have examined them, and he may lose his ship and very probably his market.

1831. *Dame Rachel Crowdy*: It would probably slow up shipping generally?

Mr. C. J. Flynn: Undoubtedly.

* See Appendix II.

27 November, 1935.]

[Continued.]

1832. *Dame Rachel Crowdy*: When you speak of licences—this is rather a delicate question—being issued by the Board of Trade, do all the requests for licences go to a senior and responsible official, or do junior officials deal with requests for licences?

Mr. W. B. Brown: There are a number of applications which are just common form, for material which is not really war material, but which is covered by the regulations; they are dealt with automatically; but with regard to the rest I have known cases which have got up to Cabinet Ministers as to whether a licence should be granted.

1833. *Dame Rachel Crowdy*: I was meaning applications which might not necessarily be suspicious, but might give rise to suspicion. Would they be dealt with by a junior official, or do all licences have ultimately to be "vetted" by a senior responsible official?

Mr. W. B. Brown: They would have to go in any case to the Foreign Office and the Service Departments. The application would be sent in a common-form letter by the official in charge of the licensing section of the Board of Trade to those Departments. It is very difficult to say whether there is any general rule as to how far it should go. Most of the licences which are issued by us—all but 4 per cent., I think, of our total number of licences—are not for war material properly so called; most of them are dealt with by not a very senior official. My category is Second Secretary to the Board of Trade, and during my short term of office I have seen two cases which have been put up to me.

1834. *Dame Rachel Crowdy*: There, again, they use their discretion?

Mr. W. B. Brown: Yes. I am afraid that is necessary in every organisation.

1835. *Dame Rachel Crowdy*: I think it is, but I also think it is unfortunate. We have had it suggested to us once or twice in connection with the licensing system that it would be a good plan to have an International Control Board, supposing any international agreement could be reached. Do you see any difficulty from the British point of view, if such a Board were set up, to your sending in the data

with regard to the number of licences issued, at short intervals, say once a fortnight, and for all licences to be recorded at a central place?

Mr. W. B. Brown: Information could be compiled, and a certain amount of information of that kind is now given regularly in Parliament in answer to Questions.

1836. *Dame Rachel Crowdy*: Do you think it would be practicable from the machinery point of view?

Mr. W. B. Brown: I think it would be possible, but the number of licences issued does not necessarily represent the exports.

1837. *Chairman*: We have not asked any questions about the Admiralty. I suppose the number of instances in which this particular question arises with regard to the construction of warships does not arise very often, does it?

Mr. W. St. D. Jenkins: No. Compared with pre-War, there has been a small number of ships built for foreign countries. Since the Armistice there has been a certain number of orders, chiefly for Portugal and Poland.

1838. *Chairman*: And the Treaties of Washington Act of 1922 does provide, does it not, for a considerable amount of publicity at all stages, at any rate as between the contracting parties?

Mr. W. St. D. Jenkins: Oh, yes, certainly. They interchange information.

1839. *Professor Gutteridge*: Supposing an application is made for the export of naval ordnance, does that go to the Admiralty?

Mr. W. B. Brown: It comes to the Board of Trade in the first place.

1840. *Professor Gutteridge*: And is then sent on to the Admiralty?

Mr. W. St. D. Jenkins: Naval Ordnance, not fitted in a warship, would come under the licensing system on export.

1841. *Professor Gutteridge*: But it would come to you from the Board of Trade?

Mr. W. St. D. Jenkins: Yes.

Chairman: I think, gentlemen, that is all we have to ask you. We are very much obliged to you for the very full information with which you have supplied us, and for coming here to help us. We now feel that we have complete information about the practice.

(Adjourned.)

APPENDIX I

MEMORANDUM PREPARED BY THE BOARD OF TRADE IN COLLABORATION WITH THE FOREIGN OFFICE, ADMIRALTY, WAR OFFICE, AIR MINISTRY AND BOARD OF CUSTOMS AND EXCISE.

THE LICENSING SYSTEM FOR THE CONTROL OF EXPORTS OF ARMS.

HISTORY OF THE CONTROL OF EXPORTS OF ARMS FROM THE UNITED KINGDOM.

LEGISLATION.

1. Legislation empowering the prohibition of export of Arms and Ammunition is traceable as far back as the Tonnages and Poundages Act (12 Charles II, Cap. 4), and these powers are perpetuated in several later Acts, e.g. 1755, 1825, 1833 and 1845. In Section 112 of the last-quoted Act (Customs Act, 1845) there is set out in a Table of Prohibitions and Restrictions Outwards, the following list of goods which may be prohibited to be exported by Proclamation or Order in Council:—

Arms, Ammunition and Gunpowder.

Military Stores, Naval Stores and any Articles (except Copper), which Her Majesty shall judge capable of being converted into or made useful in increasing the Quantity of Military or Naval Stores.

Provisions or any Sort of Victual which may be used as Food by Man.
The penalty for contravention of an export prohibition was forfeiture of the goods.

2. With the addition of a clause to cover goods "carried coastwise" this provision was embodied in section 150 of the Customs Consolidation Act of 1853, which, in turn, was re-enacted without amendment in Section 138 of the Customs Consolidation Act, 1876, and was repeated in Section 8 of the Customs and Inland Revenue Act, 1879, in similar words with the provision, in addition, of a fine for contravention of a prohibition, where previously the only penalty had been forfeiture. This last section is still in force.

3. So far, an Order or Proclamation prohibiting the export of arms could only be general, that is to say, any prohibition had to cover export to all destinations. By Section 1 of the Exportation of Arms Act, 1900, however, power was given to prohibit, by Proclamation, the exportation of arms to any specified country or place "whenever Her Majesty shall judge such prohibition to be expedient in order to prevent being used against Her Majesty's subjects or forces or against any forces engaged in military or naval operations in co-operation with Her Majesty's forces." The new powers were intended primarily to prevent the export of arms and ammunition to the Boxer insurgents in China. Immediately after the Act came into force, however, the Boxer rising was suppressed; and apparently no Proclamation prohibiting the export of arms to China was actually issued.

4. After the outbreak of the European War the power to make Proclamations prohibiting export was extended by the Customs (Exportation Restriction) Acts, 1914, to cover the export of all articles of any description; and by the Customs (Exportation Restriction) Act, 1915, power was given to secure that any article to which a prohibition applied was delivered to an authorised consignee. These extended powers were valid only in time of war; but they had an important bearing on the development of the export licensing system.

5. The powers to prohibit the export of articles other than arms, ammunition, etc., lapsed after the War; but Section 17 of the Finance Act, 1921, extended Section 8 of the Customs and Inland Revenue Act, 1879, to cover weapons and munitions of war of every description, and also firearms not

being weapons of war and ammunition for such firearms. It also gave power to prohibit shipments as ship's stores.

6. The text of those sections quoted above, which are still in force, is given in Annex A.

THE WAR PERIOD.

7. *Export Prohibition.*—Until the outbreak of the European War, although the necessary power existed, there was apparently no actual prohibition of the exportation of arms from this country.

8. In 1914, immediately on the outbreak of war, a Proclamation was issued under Section 8 of the Customs and Inland Revenue Act, 1879, prohibiting the exportation of certain articles, including arms and ammunition, to all destinations. The Proclamation was absolute in its terms, i.e., it made no mention of exports under licence, but a rough and ready export licensing system was devised almost immediately. At the outset applications for licences were submitted to the Customs, who forwarded them to the various Departments interested in the goods. In cases of doubt applications were submitted to the Committee on Trade with the Enemy—a body which had been established at the beginning of the War to deal with questions relating to the law on trading with the enemy. As the list of prohibited articles continued to expand it was found impossible for the Committee to deal with the great amount of work involved, and the War Trade Department was accordingly created by Treasury Minute, dated the 17th February, 1915, in order to control *inter alia* the issue of export licences. In addition the War Trade Department dealt with questions relating to the Black Lists, to embargoes, to agreements with trading bodies in neutral countries and to trading relations with Allies.

9. The prohibition of the exportation of war material continued without interruption until the end of the War, by which time almost everything which was capable of being of use to the enemy was on the prohibited list. With the cessation of hostilities, however, the export restrictions began to be relaxed, until the time came when only arms, ammunition, etc., remained subject to licence on exportation. The War Trade Department was wound up, in common with other war-time Departments, and the Imports and Exports Licensing Section became a unit of the Board of Trade.

POST-WAR CONTROL.

10. In 1919 the Board of Trade issued an open general licence authorising exportation without specific licence of cartridges, charges, etc., industrial explosives, double-barrelled guns and sporting rifles to certain destinations. This was subsequently modified, at the instance of the Foreign Office, in view of the provisions of the Arms Traffic Convention of the 10th September, 1919; and the revised open general licence excepted consignments to destinations within the prohibited areas specified in that Convention. (See paragraph 12 below.)

11. On the 24th March, 1921, the residue of the war-time Orders prohibiting the export of war material was replaced by a new Order defining, more closely than was done in the Acts of Parliament, the kinds of material whose export was prohibited, and making, for the first time, specific provision for

licences. The definition included fifteen classes of war material, which, although not quite so comprehensive, were substantially the same as classes (i) to (xv) of the list in the existing Order (see Annex (B)), and by a further Order made on the 13th December, 1921, the prohibition was extended to shipment as ship's stores. This last Order remained in force until 1931, when the ratification of the Ethiopian Arms Traffic Treaty, 1930, made it necessary to prohibit the export to Abyssinia of arms, including certain articles not subject to the requirements of a specific licence, viz., bayonets, swords and lances, and of aircraft (see paragraph 16 below). As the power to prohibit export to a specified country applied only where there were actual or threatened hostilities, a special Order prohibiting the export to Abyssinia could not be made. A new general Order was, therefore, made on the 19th May, 1931, extending the export prohibition to cover aircraft and bayonets, swords and lances, and at the same time an open general licence was issued permitting the export of those articles to all destinations except Abyssinia. The opportunity was taken to include separately in the prohibition certain classes of war material which had previously been regarded as falling within the classes specified in the 1921 Order. The text of the Order, which remains in force to-day, is given in Annex B.

THE ARMS TRAFFIC CONVENTIONS.

12. *The 1919 Arms Traffic Convention (Cmd. 414) signed at St. Germain-en-Laye.*—Under Article 1 of this Convention, the High Contracting Parties undertook to prohibit the exportation of a short list of "arms of war," except under licence. Under Article 2, they undertook also to prohibit the export of firearms and ammunition, other than arms and munitions of war, to certain specified zones. These included the zones covered by the Brussels Act of 1890 relating to the slave trade. The Convention also provided for the annual publication of certain statistics of licences issued. The export from the United Kingdom of the arms to which the Convention related was already prohibited, so that, if the Convention had been ratified, no further action on this score would have been necessary so far as this country was concerned. The Convention was, in fact, never ratified; but His Majesty's Plenipotentiaries had signed the Protocol which reads as follows:—

"At the moment of signing the Convention of even date relating to the trade in arms and ammunition, the undersigned Plenipotentiaries declare in the name of their respective Governments that they would regard it as contrary to the intention of the High Contracting Parties and to the spirit of this Convention that, pending the coming into force of the Convention, a Contracting Party should adopt any measure which is contrary to its provisions."

It was in accordance with the obligations which His Majesty's Government had assumed under the Protocol that export of non-military firearms and ammunition to the areas specified in the Convention was excepted from the Open General Licence of 1919.

13. *The 1925 Arms Traffic Convention* is very much wider in scope than that of 1919 as regards the classes of goods it covers, and in many other respects. The special zones in respect of which exceptional control has to be exercised, are, however, smaller in extent than the prohibited areas defined in the 1919 Convention. The goods to which the 1925 Convention relates are classified into five categories: Category I includes arms, ammunition and implements of war, exclusively designed and intended for

land, sea or aerial warfare; Category II, arms and ammunition capable of use for both military and other purposes; Category III, vessels of war and their armaments; Category IV, aircraft and aircraft engines; and Category V, gunpowder and explosives, and arms and ammunition of a definitely non-military nature.

14. The Convention stipulates that the export of articles falling within Categories I and II shall be permitted only under licence issued by the competent authorities of the exporting countries. As regards Category III, the Convention requires each Government to publish quarterly a return giving certain particulars of each vessel of war constructed for, or transferred to, the Government of another State. The Convention places no restriction on the exportation of articles in Categories IV and V, except when the articles are being sent to the special zones, in which case an export licence is required. In addition to the provisions relating to export licences, there are clauses in the Convention under which comprehensive import and export statistics have to be published at stated intervals. The form the statistics should take is indicated in annexes to the Convention itself.

15. This Convention was ratified by His Majesty's Government in 1930, with the reservation that ratification would not become effective until ratification by the other principal arms-producing States. This condition has not been met, but in general the Convention procedure for the licensing of arms, munitions, implements of war and aircraft is followed in this country.

16. *The Ethiopian Arms Traffic Treaty, 1930*, between the United Kingdom, France, Italy and Ethiopia, which was signed in Paris on the 21st August, 1930, applies the provisions of the 1925 Arms Traffic Convention to Abyssinia. It has been ratified by all four countries, and His Majesty's Government are, therefore, bound by its provisions so far as the export of arms from this country is concerned. Broadly speaking, the effect of the Treaty is that none of the articles covered by "The Arms Export Prohibition Order, 1931", may be imported into Abyssinia except under the authority of specific export licences, and export licences are not issued for articles falling within Categories I, II and IV, unless the application is supported by an import permit issued by the Ethiopian Government.

17. *The draft Arms Traffic Convention which is now before the League of Nations* covers practically the same goods as the 1925 Convention except that it is more definite in the description of certain component parts and it specifies in detail certain component parts of aircraft. This greater definition would involve some minor amendment of the Arms Export Prohibition Order. The draft Convention also provides for all aircraft to be subject to specific export licences. In some respects the new draft Convention is narrower than the 1925 Convention in that it does not cover explosives and weapons which are not used for military purposes, nor does it make any provision for special zones. The export licences would be issued only on production of permits to import from the importing country. The import of arms and ammunition into the United Kingdom is already subject to import licence.

18. From the foregoing it will be seen that His Majesty's Government have so far as concerns the licensing of arms, munitions and implements of war, amended their regulations as necessary from time to time so as to be in a position to give effect to the international arrangements which have been either in prospect or actually put into operation.

CONTROL OF EXPORTS OF WAR MATERIAL IN THE UNITED KINGDOM.

BOARD OF TRADE POWERS AND ACTION.

19. The Board of Trade is responsible for the issue of Export Licences in connection with the control of arms.

20. The Board of Trade powers to regulate the export of arms from the United Kingdom are derived from Section 8 of the Customs and Inland Revenue Act, 1879, as amended and extended by Section 1 of the Exportation of Arms Act, 1900, and

Section 17 of the Finance Act 1921. Under these enactments, power is given to prohibit by Proclamation or Order-in-Council the export or coastwise shipment of weapons and munitions of war of every description, as well as firearms not being weapons of war and ammunition for such firearms. (See Annex A.)

21. The present arms export licensing system has been in force without substantial alteration since 1921, but is now based on the Arms Export Prohibition Order-in-Council of 1931 which specifies 20 classes of material the export of which from the United Kingdom is prohibited except under licence. (See Annex B.) Open general licences (Annexes C and D) issued about the same time as the Order-in-Council permit the unrestricted export (except to certain destinations in Asia and Africa) of specified materials in those classes, such as shot guns and their ammunition and industrial explosives which are not in fact war material. The general effect is that the export of war material and rifled weapons of every description is subject to the issue of a specific licence by the Board of Trade, whatever may be the destination. (Aircraft which have no armament do not require a specific licence on export unless the destination is Abyssinia.)

22. The general procedure in connection with export licences is that application is made to the Board of Trade for the issue of a licence. The Board then consults the Foreign Office, and also the Service Departments in some cases, as to whether a licence should be issued, and if no objection is received the licence is given. The licence provides that the owner or shipper shall, if required by the Customs, produce proof that the goods were duly delivered at the destination named in the licence. The usual form of licence for war material (Annex F) which is restricted to exports to foreign governments, has no time limit on its validity, but is subject to the condition that it "may be modified or revoked at any time by the Board of Trade if they deem it necessary to do so (a) in the interests of Imperial security; or (b) in consequence of any international agreement to which His Majesty's Government are or may become a party". The alternative form of licence (Annex G) which is limited in validity to three months and subject to the condition that it "may be modified or revoked at any time by the Board of Trade without reason given" is used in those cases in which it is considered necessary to have a larger measure of control, e.g., in the case of dealers in arms. Thus there is effective control over the export of all arms and ammunition for war purposes.

CUSTOMS PROCEDURE ON EXPORTATION.

23.—(a) Arms must be entered before shipment under Orders made by the Board of Customs and Excise under Section 139 of the Customs Consolidation Act, 1876. Explosives as defined by the Explosives Act, 1875, must also be pre-entered under the above Section. (Ordinarily the only Customs document required for exported goods is a specification which may be presented six days after the exporting vessel has cleared.)

(b) The Board of Trade licence is endorsed by the Customs Officer with the nature and quantity of the goods loaded and is then returned to the shipper (or where the licence so requires to the Board of Trade) until such time as the quantity authorised under the licence has been shipped. It is then marked "Exhausted" and retained in the Department, or, if the terms of the licence so require, returned to the Board of Trade.

(c) The packages are identified by the Customs Export Officer prior to shipment. A special watch is kept on the loading of goods into ships bound for Italy to see that arms do not go on board. An occasional test examination of other export goods is made with a view to seeing that no arms are shipped without pre-entry.

ADMIRALTY CONTROL OVER VESSELS OF WAR.

24. The control of the building, equipping, and despatching of vessels of war under the Foreign Enlistment Act, 1870, and the Treaties of Washington Act, 1922, is carried out by the Admiralty, but naval armaments exported separately from a vessel of war are subject to the licensing procedure outlined above.

FOREIGN OFFICE ACTION.

25. The Secretary of State for Foreign Affairs is concerned in two ways with the issue of licences for the export of war material.

(1) He receives a notification from the Board of Trade that a licence has been applied for, and advises that the licence should or should not be issued.

(2) In exceptional circumstances he may inform the Board of Trade that the export of arms to a particular country or region is undesirable.

26. Each application for the issue of a licence received from the Board of Trade is considered on its merits, and consideration is given by the Secretary of State for Foreign Affairs to the following circumstances:—

(1) The nature of the consignment.

(2) The consignee. The general practice of His Majesty's Government is to issue licences for the export of war material only to governments or to the accredited agents of governments for delivery to them. In the case of material for testing purposes, samples for demonstration or exhibition, or accessories, reputable firms may be accepted as consignees.

(3) Conditions obtaining in the country to which the arms are to be exported. It may, for example, be desirable to refuse or suspend licences in time of civil disturbance.

(4) The international situation. It has, for example, been found desirable to refuse applications for licences to export arms to countries whose relations with other countries are strained.

(5) Treaty provisions. The export of arms to certain countries, for example, Abyssinia, is regulated by treaty. The Secretary of State for Foreign Affairs satisfies himself that the export of a consignment is in accordance with the treaty provisions in force before assent to the issue of a licence is given.

(6) Special circumstances. In the case of certain countries evidence that the government of the importing country has authorised the import is required. For example, in the case of China the authority of the Chinese Central Government countersigned by the Chinese Ambassador in London is required before a licence is issued. Some other countries have requested that reference should be made to their representatives in London before licences are issued.

(7) An embargo on the export of arms to a particular country or countries may be in force.

ACTION BY SERVICE DEPARTMENTS.

27. The concern of the Service Departments is to keep under observation the general trend of exports of arms. This information is conveniently obtained from the applications for licences. If any unusual movement of arms were observed, which bore upon the policy of His Majesty's Government, it would be expected that the Service Departments would call the attention of the Foreign Office to the facts.

A watch is also kept upon the applications to ensure that no weapons of secret design are exported; but as stated below the understanding with the manufacturers is so close that the possibility can virtually be ruled out, quite apart from the operation of the licensing system.

THE ARMS EXPORT LICENSING SYSTEM.

OBJECTS OF LICENSING SYSTEM.

28. From the historical part of this memorandum it will have been observed that before the War there was a power to prohibit but no licensing system. It may therefore be presumed that the primary objects of pre-War legislation were to conserve national resources and to prevent in time of actual or threatened war the export of arms and other material for use against this country and its allies. The War brought with it both prohibition of exports and a licensing system which survived after the War. Since then the powers have been adapted in peace time to other purposes, both national and international. A problem created by the War is described in the preamble to the Arms Traffic Convention, 1919, as "the accumulation in various parts of the world of considerable quantities of arms and munitions of war, the dispersal of which would constitute a danger to peace and public order," and the Preamble then goes on to state that "in certain parts of the world it is necessary to exercise special supervision over the trade in, and the possession of, arms and ammunition." The maintenance of the arms export licensing system, when other forms of prohibition on export disappeared after the War, appears to have had as its main aims the prevention of arms reaching native races, subversive elements and disarmed ex-enemy countries. The system has since found other uses, such as facilitating the imposition of embargoes on exports of arms and assisting foreign governments in regulating arms imports.

OPEN GENERAL LICENCES.

29. Under the existing system open general licences allow the export, without specific licences, of some categories of arms and ammunition and also of aircraft and aircraft engines, to any destination except certain areas in Asia and Africa. It will have been gathered from the historical section of this Memorandum that this roundabout method of providing for the licensing of the articles in question when destined to the special areas was maintained because of the limitations of existing legislation under which prohibitions relating to the export of arms in peace time must be general in character. Hence in order to give effect to the Ethiopian Arms Treaty a general prohibition had to be put into force.

30. Three Open General Licences have been issued by the Board of Trade. The first (Annex C) has the effect of requiring the issue of a specific licence for the export to Abyssinia of (a) aircraft, assembled or dismantled, and aircraft engines, and (b) bayonets, swords and lances, and component parts thereof. The second (Annex D) has the effect of requiring the issue of a specific licence for the export to specified land and maritime zones in Africa and Asia of (a) smooth bore shot-guns and ammunition for use therewith, (b) specified brands of smokeless gunpowder used in the manufacture of shot-gun cartridges, and specified industrial explosives. The third (Annex E) enables persons who hold firearm certificates to take abroad, without obtaining a specific licence, the firearms and ammunition described in the firearm certificate.

SPECIFIC EXPORT LICENCES.

31. So far as concerns the regulation of what is without question, war material, specific licences have to be obtained from the Board of Trade. The general procedure in connection with the issue of export licences is stated in paragraph 22 of this memorandum. The duty of preventing the export of unlicensed exports of arms where a licence is required falls upon the Board of Customs and Excise.

32. The list of Articles for which export licences are required is set out in the Arms Export Prohibition Order 1931 (Annex B). It includes articles which are not war material. In fact the number of licences issued for war material is only a very

small percentage of the total number of licences issued (see Annex H). Thus specific export licences are required under item (iii) for cartridges for some kinds of sporting weapons and for firearms used for industrial purposes; under item (iv) for explosives which can be used for both military and industrial purposes; under item (v) for rifled sporting weapons and for industrial apparatus such as humane cattle killers; and under item (xiii) for the large quantities of fuses for industrial use.

AIRCRAFT.

33. Unarmed aircraft and aircraft engines would not fall within the scope of the system of export licences if it were not for the Ethiopian Arms Traffic Treaty of 1930 (see paragraph 11), which required every consignment of aircraft and aircraft engines to Abyssinia to be specifically licensed. But the Air Ministry have had for many years a working arrangement with the manufacturers who supply aircraft and engines for the R.A.F., under which the consent of the Ministry is obtained before foreign orders for aircraft and engines are accepted and that Department consults the Foreign Office where considerations of foreign policy appear to be involved. A note on the Air Ministry action regarding export by the trade of aircraft and aero engines is attached as Annex I. The draft Arms Traffic Convention now under consideration by the League of Nations provides for the licensing, on export, of all aircraft whether military or civil, and also aircraft engines, as well as certain definite component parts of aircraft. If the Convention is brought into operation effect will of course be given to this provision.

LICENCES ISSUED AND REFUSED.

34. A statistical statement is attached (Annex II) which shows the number of arms export licences issued and the number of applications for licences to export war material refused in each year since 1929.

35. The number of licences refused is small but this is to be expected as the suppliers well know the position and accordingly do not apply for licences where they know they will not be granted. Apart from this the Service Departments have a close understanding with the manufacturers, which enables them effectively to control the export of arms which might be prejudicial to Imperial Security without recourse to the licensing system. When an embargo is in force the situation is that a total prohibition on the supply is imposed. If the position is doubtful the prospective supplier usually makes inquiries as to the position before taking steps to endeavour to secure an order and accordingly it is unusual for an application for a licence to be received when the circumstances are such that the application would be refused.

Board of Trade,

18th November, 1935.

ANNEX A.

EXTRACTS FROM ACTS OF PARLIAMENT.

CUSTOMS AND INLAND REVENUE ACT, 1879.

Section 8.—The following goods may by proclamation or Order in Council be prohibited either to be exported or carried coastwise: Arms, ammunition and gunpowder, military and naval stores, and any articles which Her Majesty shall judge capable of being converted into or made useful in increasing the quantity of military or naval stores, provisions, or any sort of victual which may be used as food for man; and if any goods so prohibited shall be exported or brought to any quay or other place to be shipped for exportation from the United Kingdom or carried coastwise, or be waterborne to be so exported or carried, they shall be forfeited, and the exporter or his agent or the shipper of any such goods shall be liable to the penalty of one hundred pounds.

EXPORTATION OF ARMS ACT, 1900.

Section 1.—It shall be lawful for Her Majesty by proclamation to prohibit the exportation of all or any of the following articles, namely; Arms, ammunition, military and naval stores, and any article which Her Majesty shall judge capable of being converted into or made useful in increasing the quantity of arms, ammunition, or military or naval stores, to any country or place therein named, whenever Her Majesty shall judge such prohibition to be expedient, in order to prevent such arms, ammunition, military or naval stores being used against Her Majesty's subjects or forces, or against any forces engaged or which may be engaged in military or naval operations in co-operation with Her Majesty's forces.

Section 2.—This Act shall be read as one with the Customs and Inland Revenue Act, 1879, and all the provisions of that Act, so far as they are applicable to the exportation of prohibited goods, shall apply as if they were embodied in this Act, and as if section 1 of this Act were part of section 8 of that Act.

FINANCE ACT, 1921.

Section 17.—(1) Section 8 of the Customs and Inland Revenue Act, 1879 (which gives power to prohibit the exportation and carriage coastwise of certain goods), shall extend to weapons and munitions of war of every description and firearms not being weapons of war, and ammunition for such firearms, as it applies to the goods therein mentioned.

(2) The said section, as amended by this section, shall extend so as to give power to prohibit the shipment as ship's stores, whether on vessels proceeding to foreign ports or on coastwise voyages, of any of the goods to which the said section applies, and the provision in the said section relating to a penalty shall have effect accordingly subject to the necessary modifications.

ANNEX B.

THE ARMS EXPORT PROHIBITION ORDER, 1931.

At the Court at Buckingham Palace, the 19th day of May, 1931.

Present,

The King's Most Excellent Majesty in Council.

Whereas by Section 8 of "The Customs and Inland Revenue Act, 1879", (a) it is provided that the following goods may, by Proclamation or Order in Council, be prohibited either to be exported or carried coastwise:—Arms, ammunition and gunpowder, military and naval stores, and any articles which His Majesty shall judge capable of being converted into or made useful in increasing the quantity of military or naval stores, provisions, or any sort of victual which may be used as food for man:

And whereas by Section 17 of the Finance Act, 1921, (b) it is enacted that Section 8 of the Customs and Inland Revenue Act, 1879, shall extend to weapons and munitions of war of every description and firearms not being weapons of war, and ammunition for such firearms, as it applies to the goods therein mentioned, and that the said section, as so amended by this section, shall extend so as to give power to prohibit the shipment as ship's stores, whether on vessels proceeding to foreign ports or on coastwise voyages, of any of the goods to which the said section applies:

And whereas by an Order in Council dated the 13th December, 1921, (c) made in pursuance of Section 8 of "The Customs and Inland Revenue Act, 1879", the exportation from the United Kingdom of certain articles was prohibited:

And whereas it is expedient that the said Order in Council should be revoked:

And whereas it is expedient to prohibit the exportation or shipment as ship's stores on vessels proceeding to foreign ports of the articles hereinafter enumerated:

Now, therefore, His Majesty is pleased, by and with the advice of His Privy Council, to Order, and it is hereby ordered, as follows:—

(1) As from the 1st June, 1931, the following articles shall be, and the same are hereby prohibited to be exported from the United Kingdom, or to be shipped as ship's stores on vessels proceeding to foreign ports, that is to say:—

(i) Cannon and other ordnance and component parts thereof;

(ii) Carriages and mountings and accessories for mountings for cannon and other ordnance and component parts thereof;

(iii) Cartridges, charges of all kinds, and component parts thereof;

(iv) Explosives of every description;

(v) Firearms of every description and component parts thereof;

(vi) Grenades and component parts thereof;

(vii) Machine guns, interrupter gears, mountings for machine guns and component parts thereof;

(viii) Projectiles of all kinds (except air-gun pellets) and component parts thereof;

(ix) Mines, land or sea, and component parts thereof;

(x) Depth charges, apparatus for the discharge of depth charges, and component parts thereof;

(xi) Bombs, bombing apparatus, and component parts thereof;

(xii) Flame-throwers and component parts thereof;

(xiii) Fuses and component parts thereof;

(xiv) Torpedoes and component parts thereof;

(xv) Torpedo tubes, or other apparatus for discharging torpedoes;

(xvi) Fire-control and gun-sighting apparatus and component parts thereof;

(xvii) Appliances for use with arms and apparatus exclusively designed and intended for land, sea or aerial warfare;

(xviii) Bayonets, swords and lances, and component parts thereof;

(xix) Tanks and armoured cars and component parts thereof;

(xx) Aircraft, assembled or dismantled, and aircraft engines.

Provided always, and it is hereby declared, that this Order shall not apply to any exportation or shipment as ship's stores which shall be expressly permitted by a licence given by the Board of Trade, and in accordance with the conditions (if any) of such licence.

(2) The said Order in Council, dated the 13th December, 1921, is hereby revoked.

(3) This Order may be cited as The Arms Export Prohibition Order, 1931.

M. P. A. HANKEY.

ANNEX C.

No. G.L. 110.

OPEN GENERAL EXPORT LICENCE.

In pursuance of the powers conferred upon them by the Arms Export Prohibition Order, 1931, the Board of Trade do hereby authorise and permit the exportation from any port in Great Britain or Northern Ireland to all destinations other than Abyssinia of the following goods, namely:—

Aircraft, assembled or dismantled, and aircraft engines;

Bayonets, swords and lances, and component parts thereof;

upon the following conditions:—

(1) That the Owner or Shipper of the said goods, if so required by the Commissioners of His Majesty's Customs and Excise, shall produce to them, within such time as they may allow, proof to their satisfaction that the said goods were duly delivered at a destination to which this Licence applies.

(2) That this Licence shall be deemed void and of no effect in the event of non-compliance with condition (1) as set out above.

(3) That this Licence may be modified or revoked at any time by the Board of Trade without reason given.

(4) That nothing in this Licence contained shall affect the powers of the Commissioners of His Majesty's Customs and Excise under any Act relating to the Customs or to the export of prohibited goods.

Dated the 1st day of June, 1931.

H. FOUNTAIN,
An Assistant Secretary
to the Board of Trade.

ANNEX D.

No. G.L. 111.

OPEN GENERAL EXPORT LICENCE.

In pursuance of the powers conferred upon them by the Arms Export Prohibition Order, 1931, the Board of Trade do hereby authorise and permit the exportation from any port in Great Britain or Northern Ireland to all destinations other than the destinations included in the special zones set out in the Schedule hereto, of the following goods, namely:—

(a) Smooth-bore shotguns and ammunition for use therewith;

(b) The following brands of smokeless gun-powder used in the manufacture of shotgun cartridges, namely:—

Amberite;
E.C. No. 3;
Empire;
Ideal;
K.S.G.;
Nobel No. 48;
Schultze;
Shotgun Neonite;
Smokeless Diamond.

(c) The following explosives, namely:—

Amazonite;
Amorcees;
Barwick;
Blasting Gelatine;
Bonbons;
Brocalite Gelatine;
Detonators;
Dynamite;
Dynobel;
Electric Detonators;
Fireworks,
Fog Signals;
Forcite;
Gelatine Dynamite;
Gelignite;
Glycerite;
Hertford;
L.G. Gelatine;
Monobel;
Nobel Gelatine;
Rex Powder;
Rockite.
Sabulite, No. 1;
Safety Fuses;
Samsonite;
Stonobel;
Super-Cliffite, No. 1;
Super-Cliffite, No. 2;
Super-Cliffite, No. 3;
Super-Rippite;
Super-Sabulite;
Thames Powder;
Tonite or Cotton Powder, No. 1;
Viking Powder;

upon the following conditions:—

(1) That the Owner or Shipper of the said goods, if so required by the Commissioners of His Majesty's Customs and Excise, shall produce to them, within such time as they may allow, proof to their satisfaction that the said goods were duly delivered at a destination to which this Licence applies.

(2) That this Licence shall be deemed void and of no effect in the event of non-compliance with condition (1) as set out above.

(3) That this Licence may be modified or revoked at any time by the Board of Trade without reason given.

(4) That nothing in this Licence contained shall affect the powers of the Commissioners of His Majesty's Customs and Excise under any Act relating to the Customs or to the export of prohibited goods.

Dated the 1st day of June, 1931.

H. FOUNTAIN,
An Assistant Secretary
to the Board of Trade.

SCHEDULE.

1. Land Zone.

(a) The whole of the continent of Africa with the exception of Egypt, Libya, Tunisia, Algeria, the Spanish possessions in North Africa, other than Ifni, and of the Union of South Africa, together with the territory under its mandate, and of Southern Rhodesia.

This zone also includes the adjacent islands which are situated within 100 nautical miles from the coast thereof, and also Prince's Island (Principe), in the Bight of Biafra, St. Thomas (Sao Thome), Annobon and Socotra, but does not include the Spanish Islands situated to the north of the parallel of 26° North latitude.

(b) The Arabian peninsula, Gwadar, Syria and Lebanon, Palestine and Transjordan, and Iraq.

2. Maritime Zone.

A maritime zone, which includes the Red Sea, the Gulf of Aden, the Persian Gulf and the Gulf of Oman, and is bounded by a line drawn from and following the latitude of Cape Guardafui to the point of intersection with longitude 57° East of Greenwich and proceeding thence direct to the point at which the eastern frontier of Gwadar meets the sea.

ANNEX E.

No. G.L. 112.

OPEN GENERAL EXPORT LICENCE.

In pursuance of the powers conferred upon them by the Arms Export Prohibition Order, 1931, the Board of Trade do hereby authorise and permit the exportation from any port in Great Britain or Northern Ireland to all destinations by the holder of a valid firearm certificate issued under Section 1 (1) of the Firearms Act, 1920, of the following goods, namely, the firearms and ammunition which are authorised by the said firearm certificate to be held in Great Britain or Northern Ireland upon the following conditions:—

(1) That the firearm certificate shall be produced by the holder with the firearms and ammunition to the Customs Authorities at the port of departure at the times of exportation.

(2) That this Licence shall be deemed void and of no effect in the event of non-compliance with condition (1) as set out above.

(3) That this Licence may be modified or revoked at any time by the Board of Trade without reason given.

(4) That nothing in this Licence contained shall affect the powers of the Commissioners of His Majesty's Customs and Excise under any Act relating to the Customs or to the export of prohibited goods.

Dated the 1st day of June, 1931.

(Signed) H. FOUNTAIN,
An Assistant Secretary
to the Board of Trade.

ANNEX F.

No.

EXPORT LICENCE.

This class of Licence is granted only for the export of war material to such foreign Governments (or their accredited agents) as are recognised by His Majesty's Government with the exception of the Governments of countries to which the supply of war material is precluded by Treaty.

In pursuance of the powers conferred upon them by the several Proclamations and Orders prohibiting the Exportation of certain articles from the United Kingdom, the Board of Trade do hereby authorise and permit

to export from any port in the United Kingdom to

consigned to

(hereinafter referred to as the consignee)

the following goods, namely,

upon the following conditions:—

(1) That the said goods are delivered to the consignee at the destination named in this Licence, and that the Owner or Shipper of the said goods, if so required by the Commissioners of His Majesty's Customs and Excise, shall produce to them, within such time as they may allow, proof to their satisfaction that the said goods were so delivered.

(2) That this Licence shall be deemed void and of no effect in the event of non-compliance with condition (1) as set out above and as accepted by the applicant in his application for this Licence.

(3) That this Licence may be modified or revoked at any time by the Board of Trade if they deem it necessary to do so (a) in the interests of Imperial security; or (b) in consequence of any international agreement to which His Majesty's Government are or may become a party.

Dated the

day of

, 19

NOTE.—The Board of Customs and Excise require pre-entry (i.e. entry and clearance before shipment) of all export prohibited goods.

An Assistant Secretary to the
Board of Trade.

NOTE.—If any alteration is desired in this Licence it must be returned with a request for amendment. No unauthorised alteration is permissible.

ANNEX G.

No.

EXPORT LICENCE.

In pursuance of the powers conferred upon them by the several Proclamations and Orders prohibiting the Exportation of certain articles from the United Kingdom, the Board of Trade do hereby authorise and permit

to export from any port in the United Kingdom within a period of three months from the date of this Licence, to

consigned to

the following goods, namely,

Exporters are warned that there are restrictions on the importation of certain goods into some countries and the issue of this Export Licence does not relieve the consignee from complying with the regulations (if any) in force in the country of destination.

upon the following conditions:—

(1) That the Owner or Shipper of the said goods, if so required by the Commissioners of His Majesty's Customs and Excise, shall produce to them, within such time as they may allow, proof to their satisfaction that the said goods were duly delivered at the destination named in this Licence.

(2) That this Licence shall be deemed void and of no effect in the event of non-compliance with condition (1) as set out above and as accepted by the applicant in his application for this Licence.

(3) That this Licence may be modified or revoked at any time by the Board of Trade without reason given.

Dated the day of , 19 .

NOTE.—The Board of Customs and Excise require pre-entry (i.e. entry and clearance before shipment) of all export prohibited goods.

An Assistant Secretary to the
Board of Trade.

NOTE.—If any alteration is desired in this Licence it must be returned with a request for amendment. No unauthorised alteration is permissible.

ANNEX H.

STATEMENT showing the total number of arms export licences (including licences for industrial purposes and sporting arms) issued in each of the following years:—

Year.	No. of licences.
1929	12,598
1930	11,314
1931	10,992
1932	10,897
1933	10,539
1934	10,485
1935, to 30th September	8,289

STATEMENT showing the number of licences included in the above statement which were issued for the export of war material, and the number of applications for licences for the export of war material which were refused in each of the following years:—

Year.	No. of licences. Issued.	Refused.
1929	325	5
1930	411	3
1931	435	1
1932	410	3
1933	413	—
1934	413	7
1935, to 30th September	309	7

ANNEX I.

EXPORT BY THE TRADE OF AIRCRAFT AND AERO ENGINES.

1. The primary concern of the Air Ministry in dealing with exports of aircraft and aero engines is to balance the advantages to the industry and to national defence of a healthy export trade against the necessity of retaining the advantage of whatever lead British research and inventive genius give us over other nations.

2. No individual licence is required for the export of unarmed aircraft and aero engines, except in the single case (until recently) of Ethiopia. To ensure that exports are not made which would be contrary to public policy an agreement has been made with the industry which ensures that the firms notify the Air Ministry whenever a foreign order is in contemplation. Owing to the good relations that exist between the Department and the industry and also by reason of the fact that in the main the firms depend on Air Ministry orders for their livelihood, and that in an extreme case the powers of the Official Secrets Acts might be invoked, the firms invariably conform with the wishes of the Air Ministry in their dealings with foreign customers, notwithstanding that the licensing system does not apply (except to the extent stated) to unarmed aircraft and engines. For example, in the later stages of the Chaco war, the firms loyally observed the request of the Air Ministry not to supply aircraft to Bolivia and Paraguay.

3. In order to assist the firms in gauging beforehand what aircraft or engines are likely to receive approval for export, and at the same time to indicate to the Press what degree of publicity is permissible, a system has been devised whereby aircraft and engines are assigned to three categories, Secret, Part Publication and Open. Aircraft and engines on the Secret List are not allowed to be described or even mentioned; those on the Part Publication list may be described in general outline, although not in detail, and firms are permitted to make tentative approaches to foreign powers regarding the sale of these aircraft and engines abroad. Those on the Open List can, in general, be freely sold

abroad but the prior consent of the Air Ministry is required for the sale of manufacturing rights for their construction in foreign countries.

4. The principles governing the transfer from one list to another are as follows:—

AIRCRAFT.—The Secret stage lasts until the aircraft makes its first flight, the Part Publication stage until the first production order is given by the Royal Air Force, or until the Department indicates that it has no further interest in the type.

ENGINES.—The Secret stage lasts until the engine has appeared in public (in an aircraft or otherwise) or has passed a full Service Type Test; the Part Publication stage until the engine is in production or is no longer of interest to the Service.

5. The lists are revised every quarter. They include aircraft and engines produced by firms on their own initiative ("Private Ventures") as well as those directly ordered by the Air Ministry.

6. When an application for concurrence in a possible foreign order reaches the Air Ministry, it is considered from the following points of view:—

(a) Secrecy and effect on our retaining a lead in new types.

(b) Effect on production orders for the Department—orders are only allowed to be accepted provided the needs of the Royal Air Force are not prejudiced.

(c) International situation and any embargoes which may be in force or in contemplation.

In accordance with these considerations the firm is informed that it may or may not accept the order, or that it may accept it subject to restrictions as regards the date of delivery or on such other conditions as may seem necessary. This system has worked admirably so far, and so long as the firms engaged in the production of military aircraft and engines look to the Air Ministry as their primary market, it provides a complete and flexible system for ensuring any desired degree of control.

APPENDIX II

MEMORANDUM SUBMITTED BY THE ADMIRALTY
CONSTRUCTION AND EXPORT OF WARSHIPS

1. The construction of warships in this country by private firms is subject to certain restrictions of which the most important are contained in two Acts of Parliament.

FOREIGN ENLISTMENT ACT.

2. Section 8 of the Foreign Enlistment Act, 1870, provides, in effect, that any ship destined for naval or military service, building or built in this country for delivery to a State which has become a belligerent in a war in which this country is neutral, shall be interned pending the conclusion of hostilities. By Section 21 of the Act, the power to seize or detain such a ship is vested in naval or military officers on full pay, and customs officers, and in practice the power would normally be exercised by the latter refusing clearance to the ship. Continuous watch is maintained by Admiralty Overseers in the various shipbuilding centres, and by customs officers throughout the country, on any work connected with naval construction, and there is a regular exchange of information between the two Departments. No difficulty, therefore, should occur, upon the Foreign Enlistment Act becoming operative, in preventing the despatch abroad of any vessels in contravention of Section 8. The information thus collected and exchanged between the Departments concerned would similarly be used to prevent a breach of Section 10 of the Act which forbids any increase of the armament or equipment of a belligerent ship visiting this country, or of Section 11 of the Act, which prohibits the fitting out of any naval or military expeditions against the territory of any belligerent in a war in which this country is neutral.

TREATIES OF WASHINGTON ACT.

3. The Treaties of Washington Act, 1922, was passed in order to ensure that private firms in this country observe the provisions of the Treaty of Washington which limit the displacement and armament of ships. Section 1 of the Act renders the construction of any warship, or the adaptation of any ship for use as a vessel of war, subject to the licence of the Admiralty, and the delivery of any such vessel is also prohibited without a similar licence. It is clearly provided in the Act, however, that the purpose of this licensing system is merely to ensure that the firms comply with the provisions of the Treaty.

4. Article 16 of the Treaty of Washington lays it down that if the construction of any vessel of war for a non-contracting power is undertaken within the jurisdiction of any of the contracting parties, such power shall promptly inform the other contracting parties of the date of the signing of the contract and the date on which the keel of the ship is laid, and shall also communicate to them the following particulars relating to the ship, namely:—

The standard displacement in tons and metric tons of each new ship to be laid down and the principal dimensions, namely:—

Length at waterline:

Extreme beam at or below waterline:

Mean draught at standard displacement.

The date of completion of each new ship and its standard displacement in tons and metric tons, and the principal dimensions, namely:—

Length at waterline:

Extreme beam at or below waterline:

Mean draught at standard displacement at time of completion.

5. The licensing system is administered by the Admiralty as follows:—

Upon the signature of a contract for the construction of a vessel of war or the adaptation of

a ship for use as a vessel of war, the firm in question is required to submit an application for a licence, giving the principal dimensions of the proposed vessel. A specimen form of application is attached: see Annex I.

6. The particulars thus furnished enable the Admiralty to decide whether a licence may properly be issued. It is a condition of the licence for the construction of a vessel of war for a non-contracting power that the firm shall supply at the earliest possible date the information prescribed by the Treaty for communication (through the Foreign Office) to the other signatory powers to the Washington Treaty (see Condition I, (1)-(3) of Annex I).

7. The firm is also required to supply the Admiralty with drawings showing the general arrangement of the ship (or the work to be done) for the information of the Admiralty Overseer responsible for the inspection.

8. A copy of each licence is sent to the Board of Customs and Excise for information.

9. The application for licence to deliver—see Annex II—is forwarded to the Admiralty through the Overseer, and the granting of the licence is conditional upon his giving a certificate that the work has been carried out generally in conformity with the general arrangement drawings.

10. It has not been found necessary to attach any special conditions to a delivery licence. Condition I (4) of the building licence requires the firm to supply on completion of the vessel the date of its completion and its principal dimensions at the time of completion for communication to the Signatory Powers. Steps are taken to ensure that this condition is complied with and the information given by the firm on completion of the work is supplied to the Foreign Office for communication to the signatory powers.

11. A copy of each application to deliver is supplied to the Board of Customs and Excise for information.

12. When the construction is to the order of the Admiralty itself, the firms are granted licences to build and deliver without prior application.

13. It may also be mentioned that Article 18 of the Washington Treaty imposes a restriction on the disposal of war vessels which does not involve legislation. The signatory powers bound themselves not to dispose, by gift, sale or any mode of transfer, of any vessel of war in such a manner that it might become a vessel of war in the navy of any foreign power. In pursuance of this obligation, it has been the practice of the Admiralty to sell for demolition by recognised ship breakers. Exceptionally when any obsolete or surplus vessels have been sold, after demilitarisation, for further use, the purchaser has been required to give a substantial bond that the vessel will remain under the British Flag and will not be re-sold without the consent of the Admiralty.

LONDON NAVAL TREATY ACT.

14. Just as the Treaties of Washington Act was passed to give effect in this country to the provisions of the Treaty of Washington, so the London Naval Treaty Act, 1930, is intended to enforce in this country the provisions of the London Naval Treaty. The clauses of that Treaty which chiefly affect construction of ships by private firms in this country, namely, clause 2 of Article 4, which limits the size and armament of Aircraft Carriers, and

clause 4 of Article 7, dealing with Submarines, only take effect as from the coming into force of the Treaty in respect of all the high contracting parties. France and Italy, two of the high contracting parties, have not ratified the Treaty: consequently these clauses are not in force, and the practical effect of the London Naval Treaty Act in this connection is negligible.

ANNEX I.

TREATIES OF WASHINGTON ACT, 1922.

APPLICATION FOR LICENCE TO:—

- (a) Build a vessel of war,
- (b) Alter, arm or equip any ship so as to adapt her for use as a vessel of war.

To be forwarded in duplicate by the Firm making application; one copy will be retained at the Admiralty whilst the other will be returned to Firm in due course.

Applicants are required to provide such facilities as may be desired by the Admiralty either at their offices and works or at Admiralty offices for the examination of the designs and particulars of the vessel in regard to which this application is made.

Any licence which may be granted will not permit or condone any breach by the Licensee or by any servant or agent of the Licensee of any provision of the Foreign Enlistment Act, 1870.

Whereas by section 1 sub-section (i) (a) of the Treaties of Washington Act, 1922, it is enacted as follows:—

- 1.—(1) No person shall, without a licence from the Admiralty:—

- (a) Within any part of His Majesty's Dominions to which this Act applies, build any vessel of war, or alter, arm or equip any ship so as to adapt her for use as a vessel of war;

And whereas by sub-section (2) of the same section it is enacted that:—

- (2) An application for a licence under this section shall be accompanied by such designs and particulars as the Admiralty may require.

Now application is hereby made by

.....
for a licence to
at

The principal dimensions of the proposed vessel (being such principal dimensions as are referred to in Part 3 Section 1 of First Schedule to the Act) are as stated on attached sheet, and the Yard number for her will be

The following undertakings are hereby given with the intention that they shall become binding on the granting of the licence:—

- (1) To supply, for the examination and retention of such Inspecting Officers as the Admiralty may appoint, all such designs and particulars as those Officers may from time to time require to satisfy themselves that the obligations enumerated in the First Schedule to the Act will be observed.

- (2) During the construction and on completion of the vessel, to afford all necessary facilities for the purposes of such inspection as the Admiralty may consider necessary.

- (3) That the obligations above mentioned will be fully observed and that the granting of a licence by the Admiralty will not be regarded as waiving or dispensing with their full observance or as prejudicing any subsequent action by the Admiralty under the Act.

of
are hereby authorised to proceed with the work above mentioned on vessel No. on the undertakings given in the application and on the conditions hereinafter mentioned.

This Licence has no force or effect if any action thereunder shall be or become a breach by the Licensee or by any servant or agent of the Licensee of any provision of the Foreign Enlistment Act, 1870.

By Command of Their Lordships.

Secretary of the Admiralty.

Date

THE CONDITIONS that appear necessary to the Admiralty for the purpose of securing the observance of the obligations imposed by the Treaty for the Limitation of Naval Armament are:—

1. The following particulars as at (1), (2) and (3) are to be supplied to the Admiralty at the earliest possible date, and as at (4) on completion of the vessel, for communication to the other Powers signatory to the Treaty for the Limitation of Naval Armament, namely:—

- (1) The date of the signing of the contract.

- (2) The date on which the keel is laid.

- (3) The standard displacement in tons and metric tons and the principal dimensions, namely, length at waterline, extreme beam at or below waterline, mean draught at standard displacement.

- (4) The date of completion of the vessel and its standard displacement in tons and metric tons and the principal dimensions, namely, length at waterline, extreme beam at or below waterline, mean draught at standard displacement, at time of completion.

2.

Secretary of the Admiralty.

ANNEX II.

TREATIES OF WASHINGTON ACT, 1922.

APPLICATION FOR LICENCE to despatch or deliver, or allow to be despatched or delivered, from any place within any part of His Majesty's Dominions to which this Act applies a ship which has been built, altered, armed or equipped as a vessel of war either entirely or partly within His Majesty's Dominions.

To be forwarded in duplicate by the Firm making application; one copy will be retained at the Admiralty whilst the other will be returned to Firm in due course.

Any licence which may be granted will not permit or condone any breach by the Licensee or by any servant or agent of the Licensee of any provision of the Foreign Enlistment Act, 1870.

Whereas by section 1 sub-section (1) (a) and (b) of the Treaties of Washington Act, 1922, it is enacted as follows:—

1. (1) No person shall, without a licence from the Admiralty:—

- (a) within any part of His Majesty's Dominions to which this Act applies, build any vessel of war, or alter, arm or equip any ship so as to adapt her for use as a vessel of war;

- (b) despatch or deliver, or allow to be despatched or delivered, from any place within any part of His Majesty's Dominions to which this Act applies any ship which has been so built, altered, armed or equipped as aforesaid

either entirely or partly within His Majesty's
Dominions:

Now application is hereby made for a Licence to

APPENDIX III

NOTES ON CATEGORIES OF PROHIBITED GOODS IN THE ARMS EXPORT PROHIBITION ORDER, 1931.

Category.	Whether war material.	Whether included in any Open General Licence.
(i) Cannon and other ordnance and component parts thereof.	All war material	No.
(ii) Carriages and mountings and accessories for mountings for cannon and other ordnance and component parts thereof.	All war material	No.
(iii) Cartridges, charges of all kinds, and component parts thereof.	Partly war material	Ammunition for smooth bore shot-guns (but not their components) is covered by Open General Licence (G.L.111). Ammunition on personal firearm certificates may also be covered by G.L.112.
(iv) Explosives of every description.	Partly war material	Specified brands of industrial explosives and smokeless gun-powder for shotgun cartridges covered by G.L.111.
(v) Firearms of every description and component parts thereof.	Partly war material	Smooth bore shotguns (but not component parts) covered by G.L.111. Personal firearms on a firearm certificate, issued by the Police, covered by G.L.112.
(vi) Grenades and component parts thereof	All war material	No.
(vii) Machine guns, interrupter gears, mountings for machine guns and component parts thereof.	All war material	No.
(viii) Projectiles of all kinds (except air-gun pellets) and component parts thereof.	Partly war material	No.
(ix) Mines, land or sea, and component parts thereof.	All war material	No.
(x) Depth charges, apparatus for the discharge of depth charges, and component parts thereof.	All war material	No.
(xi) Bombs, bombing apparatus and component parts thereof.	All war material	No.
(xii) Flame-throwers and component parts thereof.	Licences would not be issued for war material, but licences have been issued for similar appliances for destroying locusts and other pests.	
(xiii) Fuses and component parts thereof	Partly war material	No.
(xiv) Torpedoes and component parts thereof	All war material	No.
(xv) Torpedo tubes, or other apparatus for discharging torpedoes.	All war material	No.
(xvi) Fire control and gun sighting apparatus and component parts thereof.	All war material	No.
(xvii) Appliances for use with arms and apparatus exclusively designed and intended for land, sea or aerial warfare.	All war material. (The interpretation of this has been appliances for use with arms and appliances for use with apparatus. It covers such items as :— (1) Belt filling machines (i.e. machines for filling rapidly machine gun belts). (2) Rounds counter gear. (i.e. an apparatus fitted to machine guns to register the number of rounds fired). (3) Artillery and infantry range-finders. (4) Periscopes. (5) Depth and roll recorders for torpedoes.	No.
(xviii) Bayonets, swords and lances, and component parts thereof.	Partly war material, but bayonets are not usually exported apart from rifles, and swords and lances are not modern weapons of war.	Export covered by Open General Licence, G.L.110.
(xix) Tanks and armoured cars and component parts thereof.	All war material	No.
(xx) Aircraft, assembled or dismantled, and aircraft engines.	Aircraft without armament or appliances and apparatus for use with arms are not regarded as war material.	Export of aircraft covered by Open General Licence G.L.110, but a specific licence would be required for armament including armament fittings such as bomb racks, interrupter gear and torpedo release gear.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

THIRTEENTH DAY

Wednesday, 8th January, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

General The Honourable Sir HERBERT A. LAWRENCE, G.C.B., Commander Sir CHARLES W. CRAVEN, O.B.E., R.N. (retired), Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT MCLEAN and Mr. A. DUNBAR; representing Messrs. Vickers Limited and Associated Companies: called and examined.

1842. *Chairman*: We have met to consider the evidence submitted on behalf of Messrs. Vickers Limited and their associated companies, including the English Steel Corporation. With regard to the English Steel Corporation, they submitted a statement* which is now in print and will be handed to the Press and become part of our record. It consists mainly of a challenge of the accuracy of the statement made on behalf of the Union of Democratic Control with reference to a number of technical details. With regard to that, if it becomes material for the Commission to form a judgment upon those particular matters, they will feel it necessary to call in some independent expert advice to deal with those technical questions when the time arrives. The statement of the English Steel Corporation will not be gone into to-day any further than I have indicated; it will not be necessary to call witnesses upon that, but if it becomes necessary we shall take independent expert advice.

Then, with regard to the evidence submitted on behalf of Messrs. Vickers Limited and their associated companies, I propose, in the first instance, to read some correspondence which passed between Sir Herbert Lawrence, the Chairman, and the Commission, as indicating the lines upon which their evidence has been prepared and the information with which we asked them to supply us. The first letter is a letter which was written by the Chairman of Vickers Limited to me as Chairman of the Commission very soon after the Commission was appointed and it is in these terms:

Vickers Limited,
Vickers House,
Broadway,
Westminster, S.W.1.
20th February, 1935.

SIR,

As Chairman of Vickers Limited and Vickers-Armstrongs Limited, I beg to put at the disposal of the Royal Commission such information as you may require for the purposes of your enquiry. Should you or the members of the Commission desire to visit our works at Barrow, Newcastle, Sheffield, Manchester, Crayford, Southampton and Weybridge, we shall gladly make all necessary arrangements.

I have the honour to be,

Sir,

Your obedient Servant,

(Sgd.) H. A. LAWRENCE.

The Rt. Hon. Sir John Eldon Bankes, P.C., G.C.B.,
Royal Commission into the Traffic in Arms,
2, Whitehall Gardens,
S.W.1.

* Appendix 10, p. 413.

In reply to that, after considering the matter, the Commission submitted a questionnaire to Messrs. Vickers, and that was in this form. It is a letter written by our Secretary.

ROYAL COMMISSION ON THE PRIVATE
MANUFACTURE OF AND TRADING IN ARMS
8, Buckingham Gate, S.W.1.
23rd April, 1935.

SIR,

With reference to your letter of the 20th February last, addressed to Sir John Bankes, I am directed by the Royal Commission on the Private Manufacture of and Trading in Arms to request that they may be furnished for the purposes of their Inquiry with full information under the following headings, relative to Messrs. Vickers Ltd. and Messrs. Vickers-Armstrongs Ltd. and any subsidiary companies under their control:—

1. The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war.
2. The proportion of the turnover in each of the last five years, representing arms and munitions of war, attributable to (a) United Kingdom, (b) British Empire and (c) foreign, orders.
3. The estimated value of plant employed in the production of arms and munitions of war that would be rendered redundant in the event of the establishment of a State monopoly.
4. The amount of declared profits of each of the last five years; and an estimate of the proportion thereof attributable to the production of arms and munitions of war.

(The above to be accompanied by published accounts for the five years.)

5. The average number of employees engaged in each of the last five years on the production of arms and munitions of war, and other products, respectively.

6. The firm's capacity for expansion for purposes of the production of arms and munitions of war (a) with, (b) without, the use of plant normally employed on other products. What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war?

7. Particulars of any agreements with other firms engaged in the production of arms and munitions of war stating the names of the parties, British and foreign, to such agreements.

8 January, 1936.]

General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

8. Details of the firm's present holdings of the capital of other firms, giving names (British and foreign), and of the holdings of the firm's capital by other firms, giving names (British and foreign).

9. The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war.

The phrase "arms and munitions of war" should be interpreted for the present purpose as including (a) all the articles enumerated under headings (i) to (xx) of Article (1) of the Arms Export Prohibition Order, 1931 (S.R. & O., 1931, No. 413), and (b) vessels of war of all kinds, together with arms, ammunition and implements of war mounted on board vessels of war and forming part of their normal equipment. A copy of the Order-in-Council is enclosed for convenience of reference.

I am at the same time to request that you will nominate a representative or representatives to appear before the Royal Commission for the purpose of giving oral evidence.

I am to add that a further communication will be addressed to you in the event of the Royal Commission desiring evidence in regard to other matters that may arise in the course of their inquiry.

I am, Sir,
 Your obedient Servant,
 (Sgd.) E. TWENTYMAN.

General Sir Herbert A. Lawrence, G.C.B.,
 Chairman,

Messrs. Vickers Ltd.,

Messrs. Vickers-Armstrongs Ltd.,
 Vickers House,
 Broadway, S.W.1.

That letter was replied to in these terms:

The Secretary,
 The Royal Commission on the Private Manufacture of and Trading in Arms,
 8, Buckingham Gate,
 S.W.1.
 21st October, 1935.

Sir,

In reply to your letters of the 22nd February* and 23rd April, 1935, I beg to forward herewith:—

1.—(a) A general statement on armament manufacture by a private firm, coupled with
 (b) A short history of Vickers Limited and its various activities at home and abroad.

On this paper I shall be glad to appear before the Royal Commission and to answer any questions on the Company's policy.

2. A more elaborate statement on the organisation and activities of Vickers-Armstrongs Limited which is our main Armament Company.

3. Replies to the questionnaire with relative memoranda.

On (2) and (3), I suggest that my Colleagues, Commander Sir Charles Craven, Mr. F. C. Yapp and Mr. J. Reid Young should be called.

Sir Charles Craven is the Managing Director in charge of the works and shipyards of Vickers-Armstrongs Limited and its subsidiaries. Mr. F. C. Yapp is a Director of Vickers-Armstrongs Limited and jointly with Sir Charles Craven is responsible for all British and foreign contracts. Mr. Yapp is particularly responsible for the appointment and supervision of all agents and representatives. Mr. Reid Young is Secretary and Chief Accountant of Vickers Limited and Vickers-Armstrongs Limited.

In regard to the questionnaire and the replies thereto, every endeavour has been made to deal as fully as practicable in a concise form with the various questions, but in certain instances which

are referred to specifically in Statement No. 3, it has not been possible to deal fully with the questions as framed and in this connection I have to refer to the interview which Mr. F. C. Yapp and Mr. Reid Young had with the Secretary to the Commission on the 29th April, 1935, at which certain of the difficulties were explained. I wish to say, however, that if any amplification of the information given is desired every effort will be made to meet the wishes of the Commission.

The Commission will understand that certain of the information contained in the answers to the questions is of a confidential nature from three points of view:—

- (a) As affecting national security.
- (b) As affecting the Company's interests.
- (c) As affecting the interests of the parties to the agreements of which details are given in the answer to the questionnaire.

I respectfully submit that the reply to Question 4 should not be made public in the detailed form in which it is presented but that the published information should be limited to a statement of total profit figures as relating to the armament companies of the Vickers Group. A statement—Appendix 4c—has been prepared which it is suggested might be used, if it meets with the approval of the Commission.

It will be appreciated by the Commission that the reply to the first part of Question 6 divulges the wartime capacity of the Company expressed in man-power and I submit that this information should be considered as absolutely secret to the members of the Royal Commission.

With regard to the reply to Question 7, it will be clear to the Commission that many of the Agreements, particularly those in connection with the Steel Industry, are not connected with armaments, and are hardly relative to the scope of the inquiry now being conducted. It would be unfortunate if these agreements were to be made public, as there would be every possibility of their publication affecting the trade of a great industry and particularly the foreign business.

It will be seen that in Appendix 8, which contains the information asked for in Question 8, are given details of all the Investments of Vickers Limited and of the other Companies in the Group.

A large number of these Investments is in Companies in no way connected with the Armaments Industry and are Investments held in the ordinary way of business by the Companies concerned. It is thought that the only Investments which would prove of interest to the Commission are those which are, or might be, indirectly connected with the Armaments Industry and that the others are in no way relevant to the Commission's Inquiry.

No doubt the Commission will understand that the publication of a complete list of the Investments of the Companies in the Group may be prejudicial to the affairs of the Company, and it is felt that it is only proper, as safeguarding the interests of the Shareholders, that a request should be made to the Commission that details of Investments other than those connected with the subject of the Inquiry, are not made public.

In order to guide the Commission the Appendix has been sub-divided to show:—

In Part 1—Investments in Companies in the Vickers Group (whether or not connected with the Armament Industry) and others, which, to the best of our knowledge are engaged in, or indirectly connected with the businesses of armament manufacture, steel manufacture and ship-building, and

In Part 2—Other Investments.

It is not my Company's desire to prevent the publication of anything arising from the Agreements which have already been made public by the United States Special Committee, and in fact, 1

* Acknowledgement of letter of 20th February.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

welcome a full investigation into these Agreements and the fullest publicity regarding them.

I wish to make it clear that in making the above submissions, my Company raises no objection to any information given in reply to the questionnaire being made available to the Defence Departments of the country.

If at a later date it is decided to ask me for further information, I shall be only too pleased to place myself at the disposal of the Royal Commission.

I have the honour to be,

Sir,

Your obedient Servant,

For VICKERS Limited.

(Sgd.) H. A. LAWRENCE,
 Chairman.

Now, I have read that correspondence for two reasons. First, because we indicated at the commencement of our sittings that, as far as possible, we should conduct this inquiry in public. But, of course, it was obvious that on certain points it might be necessary to decide that it was reasonable that a certain amount of the information given to us might be treated as confidential and not made public. As a result of our questionnaire, a very full answer has been given to all our inquiries by Messrs. Vickers and they have indicated in the letter the desire that a certain amount of that information should be treated as confidential. That seems to us to be a reasonable request. The full information is contained in this very voluminous document. It is divided into parts which will be dealt with publicly and parts which will be dealt with in private.

Having made that preliminary statement, I will ask Sir Herbert Lawrence, if he would, to come as the first witness and I will ask him also if he would either read, or have read for him, Statement No. 1, which is in print; and then after that, if he wishes—as I believe he does wish—to supplement that by a further statement. Then will follow any questions which the Commission desire to put to him before we proceed to take the evidence of the other witnesses.

In the ordinary course, we have given to the Press information as to the position of the witness and I have here a statement which I will read in order that it may become part of the record: General The Honourable Sir Herbert A. Lawrence, G.C.B., served South Africa, 1899-1902; Dardanelles, 1915; Egypt, 1916; Chief of Staff, Headquarters, British Armies in France, 1918-1919; Member, Royal Commission on Coal Industry, 1925; Governor of Wellington College; Hon. LL.D. St. Andrew's University; Hon. D.C.L. Oxford University; Awarded various French, Belgian, American, Roumanian and Japanese Orders; Managing Partner of Glyn, Mills & Co., Chairman, Vickers Limited since 1926; Vickers-Armstrongs Limited 1928-1935; Director: Bank of Roumania (Chairman); Dalgety & Co., Limited, London (Midland and Scottish Railway; Ottoman Bank (Chairman of London Committee); Sun Insurance Office Limited; Sun Life Assurance Society.

Sir Herbert, will you read Statement No. 1 yourself, or would you desire to have it read for you?

Sir Herbert Lawrence: I will read it, if you please, Sir.

1843. Chairman: Yes.

Sir Herbert Lawrence: (reading)

STATEMENT No. 1

A. GENERAL STATEMENT ON ARMAMENT MANUFACTURE BY A PRIVATE FIRM.

The question of the manufacture of arms by the State or by private firms has been obscured by a certain amount of prejudice and accusations of corrupt practice, and by a very imperfect understanding of what is comprised in the term "armaments." It is impossible to reply to such accusations in the absence of categorical statements. Such statements as I have seen have been largely distortions of facts which bear a simple explanation. The prejudice is the expression of an honourable but perhaps mistaken ideal respecting the sanctity of life and the iniquity of war, which must command sympathy.

I have to deal with the question of the advantage or disadvantage to the State of private manufacture of armaments and to assume that armaments are required by the modern state under present conditions. Assuming that armaments are required, it is clear that they must be modern, and in a mechanical age, thoroughly up-to-date. In order to ensure this, if the manufacture of arms is to be a function of the State, the State will have to keep large plants in being without having the advantage of supplying an export trade or of engaging in commercial activities. In order to be in a position to pass rapidly from a peace time to a war time production, it will have to manufacture on a scale far higher than is normally required. After a prolonged peace, most of its production would be obsolete.

State manufacture is traditionally unenterprising and there will always be a tendency to be satisfied with conditions which may be expected to "last my time." In private manufacture there is the restless activity which derives from competition, and from the fear of being left behind in the race for employment. This may be exemplified by the fact that until the latter half of last century this country alone was armed with smooth bore, muzzle loading guns.

1844. Chairman: May I interrupt? Was it this country only that was armed?

Sir Herbert Lawrence: What I meant to imply was that while other countries were armed with the breech loading gun, this country was not so armed. (reading)

It was the genius of Sir A. Noble and his staff at Elswick which drove the Government to equip the Army with rifled ordnance and breech loading mechanism, after they had supplied numerous foreign countries. The State has the right to acquire any patented new invention which may be developed by the enterprises of private firms, a right which is of first class importance. Research work is going on continuously in the factories of the Vickers Group.

As an example, it is now realised that a new force has arisen which may be a determining factor in the war of the future—the aeroplane. One of the most important counter weapons for land purposes is the anti-aircraft gun. Vickers' technical staff have designed a gun which in competition with the gun manufacturers of the world has proved its pre-eminence. A demand from abroad has resulted in the development of a gun which is unrivalled. Our own Government, if it wishes, can get the full advantage of this development.

The Dockyards and Arsenals belonging to the State are no doubt very highly efficient but in the event of war they could not do much more than keep abreast of repair work as far as the Navy is concerned and would be inadequate for the mass production of guns and ammunition. The State can, as long as private firms exist, fall back on them to supplement their normal production. The Government could do what was done in the last war with the railways—viz., take over the whole business as a going concern, guarantee a reasonable dividend to shareholders, provide for depreciation and make an agreed payment for obsolescence when the factories were returned to private ownership. On the other hand, to acquire existing factories and operate them for the Government in peace time would entail a cost

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

which is dealt with to some extent in the third paper placed before the Royal Commission.
 1845. *Chairman*: Just one moment. When you speak of "third paper" there you mean the third statement.*

Sir Herbert Lawrence: That is so. (reading)

I have remarked in the first paragraph of my statement that I think there has been a good deal of misunderstanding, certainly in the minds of the witnesses who have given evidence before the Commission, as to what is comprised in the term "armaments." Speaking from the point of view of my own Company, I wish to take this opportunity of impressing on the Commission that when we, that is Vickers-Armstrongs Limited, are considering the term "armaments," we do not think in terms of shells, which it is admitted are manufactures which could be undertaken by any mass production engineering concern equipped with suitable modern machine tools and with unskilled labour, but we think in terms of the more advanced and complicated type of armaments such as:—

Warships,
 Heavy guns, breech mechanisms and sights,
 Gun mountings and field carriages,
 Director firing gear and fire control appliances,
 Torpedoes and torpedo tubes,
 Fuses and cartridge cases.
 Automatic guns,
 and work of this nature.

So far as shells are concerned, the only type of this product which is, in the view of my Company's

experts, regarded as a specialised form of armament manufacture is the armour piercing shell. I lay stress on this point because from my reading of the evidence which has been given before the Commission by witnesses who refer to the matter it appears to me that it is correct to say that they are thinking in general terms of such products as shells and rifles. I desire to take this opportunity of impressing on the Commission the fact that my Company, while equipped to a certain extent to undertake the manufacture of these two last-mentioned items, do not attach any importance thereto from the point of view of armament manufacture in war time, but regard themselves as specialists, and highly equipped specialists, for the production of the more complicated and specialised forms of armaments referred to above. While stressing this point I have not lost sight of the fact that in forwarding the questionnaire the Commission appreciates the wide and in many directions highly specialised field covered by the general term "armament manufacture" and has, in fact, given a definition of what it regards as covered by that term.

1846. *Chairman*: That is the end of the first part of Statement No. 1. Now, do you wish one of your other witnesses to deal with the second part, or will you read it?

Sir Herbert Lawrence: With your permission, Sir, I will ask Mr. Reid Young to read the second paper.

Mr. Reid Young read portions of the following statement, as indicated by the Chairman. The remainder was taken as read:—

B. VICKERS GROUP—BRIEF HISTORICAL SURVEY.

The Company was registered on 17th April, 1867, as Vickers Sons & Company, Limited, with a capital of 1,550 shares of £100 each, to take over the business of Naylor Vickers & Company, Steel Makers and Manufacturers, of Sheffield.

The business of Naylor Vickers & Company was originally established in the latter part of the 18th century by Mr. George Naylor, who took into partnership in 1829 his son-in-law, Mr. Edward Vickers. The Company was engaged in heavy engineering and steel manufacture. In addition to producing tyres and crank axles for railways and general castings, the Company made gun forgings to Government orders. In 1888, the Government was desirous of increasing the nation's resources for the production of armaments and offered the Company an order of £250,000 with the prospect of more orders to follow if a gun-making plant were laid down. The Company thereupon entered into this important undertaking and the first gun successfully passed its trials in the same year.

Before 1888 Armour Plate was made of wrought iron with a steel face, but in that year Vickers produced an all-steel armour plate which was adopted by the Admiralty.

In 1897 the Works of the Naval Construction & Armaments Company Limited at Barrow-in-Furness were purchased, and in the same year an agreement was entered into whereby the Company acquired, as on the 1st October, 1896, the business of The Maxim Nordenfolt Guns and Ammunition Company Limited. Following this, on the 4th November, 1897, the name of the Company was changed to Vickers Sons & Maxim Limited, and on the 24th April, 1911, the name was again changed to its present title of Vickers Limited.

During the Great War the Company placed the whole of its resources at the disposal of the Government and made enormous extensions to its works and the works of its subsidiaries, in order to meet the requirements of the Government for delivery of

ships, armaments and war material. On cessation of hostilities, the Company and its subsidiaries were left with these large Works and a very comprehensive programme was entered into to endeavour to find classes of manufacture to meet the reduced peace-time call for armaments and to keep the Works fully engaged. This peace-time programme was naturally very extensive and, unfortunately, in a number of cases, far from successful. In 1926 it became necessary, in view of the losses sustained in an endeavour to find commercial engineering work and the reduced earning power resulting from the post-war conditions, to write down the assets of the Company to a figure which could be regarded as their proper value and to provide for contingent and other liabilities of the Company. The amount required for this was £12,442,366 6s. and was provided as follows:—

	£	s.	d.
By writing off two-thirds of the issued Ordinary Share Capital	8,210,322	0	0
By appropriating out of Reserve Fund an amount of ...	3,600,000	0	0
By appropriations from Profit and Loss Account ...	632,044	6	0
	£12,442,366	6	0

About the year 1918 Vickers Limited became very largely interested in electrical work and had considered the desirability of erecting large works to cope with this class of business. At this time, however, an opportunity arose to become associated with Metropolitan Carriage Wagon & Finance Company Limited, a Company primarily engaged in the manufacture of Railway Rolling Stock. The two Companies had very large interests in the British Westinghouse Electric & Manufacturing Company Limited, and other electrical engineering undertakings and it was considered it would be desirable to amalgamate the interests of both under one control on account of the community of interest in the electrical industry, and by reason of the fact

* See p. 374.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.R.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

that the alliance with Vickers of the Rolling Stock business would be of advantage. As a result, Vickers Limited acquired the whole of the Preference Shares and 99.99 per cent. of the Ordinary Shares of the Metropolitan Company for Shares in its own capital and for cash.

The Company, in 1927, agreed to the fusion with Sir W. G. Armstrong Whitworth & Company Limited (now called Armstrong Whitworth Securities Company, Limited) of the armament, main ship-building and certain commercial interests of the two Companies, and transferred to a new Company, formed for that purpose on the 31st December, 1927, under the style of Vickers-Armstrongs Limited for Shares, its works at Sheffield, Barrow, Erith and Dartford, the ranges at Eskmeals, Swanley and Eynsford, and the Experimental Tank at St. Albans, together with its interest and holdings of shares in a number of Companies engaged in shipbuilding, the manufacture of armaments, steel, etc.

Later, an agreement was entered into between Vickers Limited, Vickers-Armstrongs Limited and Cammell Laird & Company, Limited for the concentration of the steel interests of those Companies. As a result of this, English Steel Corporation Limited was registered on 13th March, 1929, and Vickers transferred to that Company for Shares its holding in Taylor Bros. & Company, Limited, and other Companies connected with the steel industry, and certain property at Sheffield.

Following the formation of Vickers-Armstrongs Limited, Vickers Limited directly operated two Works only, and it was decided to form private limited companies to take over these establishments. Vickers (Crayford) Limited was formed on the 29th June, 1928, to carry on the engineering activities at the Crayford Works and Vickers (Aviation) Limited was registered on the same day to take over the aviation business at Weybridge.

As previously stated, the original issued capital of the Company was £155,000. This was increased from time to time until it reached the figure of £20,679,290, but in 1926 was reduced by £3,210,322 to £12,468,968, made up as under:—

	£
£750,000 Preferred 5 per cent. Stock	750,000
750,000 5 per cent. Preference Shares of £1 each (fully paid) ...	750,000
6,863,807 5 per cent. (tax free) Cumulative Preference Shares of £1 each (fully paid) ...	6,863,807
12,315,483 Ordinary Shares of 6s. 8d. each (fully paid) ...	4,105,161
	<u>£12,468,968</u>

The authorised capital is:—

£750,000 Preferred 5 per cent. Stock	750,000
750,000 5 per cent. Preference Shares of £1 each ...	750,000
7,000,000 5 per cent. Cumulative Preference Shares of £1 each (free of tax up to 6s. in the £) ...	7,000,000
54,000,000 Ordinary Shares of 6s. 8d. each ...	18,000,000
	<u>£26,500,000</u>

The debenture capital is:—

4 per cent. First Mortgage Debenture Stock	£1,250,000

It is thought that at this point it would be convenient to give a statement showing the present composition of the Vickers Group, and the nature of the business carried on by each Company. This is given hereunder:—

VICKERS LIMITED—Holding Company, controlling:—

A. Vickers—Armstrongs, Limited—Shipbuilders, Engineers and Armament Manufacturers, which controls:—

Palmers Hebburn Co., Ltd.—Ship Repairers, Drydock Owners, etc.

The Placencia de las Armas Co., Ltd.—Holding company, which controls Sociedad Anonima de Placencia de las Armas—Armament Manufacturers and General Engineers.

The Thames Ammunition Works, Ltd.—Explosives Manufacturers and Ammunition Filling.

The Variable Speed Gear, Limited—Hydraulic Variable Speed Gears and Pump Manufacturers.

Vickers (Ireland), Limited—Engineers and Shipbuilders.

The Whitehead Torpedo Co., Ltd.—Manufacturers of Torpedoes, etc.

English Steel Corporation Ltd.—Manufacturers of Commercial Steels, Armour Plate, Heavy Forgings, etc., which controls:—

The Darlington Forge Limited.—Forgemasters (not active).

Firth-Vickers Stainless Steels Ltd.—(jointly with Thomas Firth & John Brown Limited).—Manufacturers of Stainless Steels.

Industrial Steels Ltd.—Commercial Steels Sales Company.

Taylor Bros. & Co., Ltd.—Manufacturers of Wheels, Tyres and Axles.

B. Metropolitan-Cammell Carriage & Wagon Co., Limited—(jointly with Cammell Laird & Co., Ltd.).—Manufacturers of Railway Rolling Stock and Bus Bodies, which controls:—

The Leeds Forge Co., Ltd.—Retained for registration purposes only.

G. H. Sheffield & Co. (Engineers), Ltd.—General Engineers and Agents.

Metropolitan-Cammell-Weymann Motor Bodies Ltd.—Bus sales Company.

The Midland Railway Carriage & Wagon Co., Ltd.—Railway Wagon Hiers.

The Patent Shaft & Axletree Co., Limited.—Iron and Steel manufacturers.

The Willingsworth Iron Co., Limited.—Iron manufacturers (closed down except for sale of slag).

Companies kept alive to preserve trade names only:—

Ashbury Railway Carriage & Iron Co., Ltd.
 Lancaster Railway Carriage & Wagon Co., Ltd.

Brown Marshalls & Co., Limited.

Oldbury Railway Carriage & Wagon Co., Ltd.

Blake Boiler Wagon & Engineering Co., Ltd.

C. Other Manufacturing Companies:—

Robert Boby Limited.—Manufacturers of Materials Handling Plant, Brewery Machinery, etc.

Cooke Troughton & Simms Ltd.—Scientific Instrument Makers, which controls:—

British Separators Limited.—Factors of "Vickcen" Oil Separators.

The Ioco Rubber & Waterproofing Co., Ltd.—India Rubber Manufacturers and Proofers.

Vickers (Aviation) Limited.—Aircraft Manufacturers, which controls:—

The Supermarine Aviation Works (Vickers) Ltd.—Aircraft Manufacturers.

Vickers Train Lighting Co., Ltd.—Factors of Train Lighting Equipment.

D. Finance and Property Owning Companies:—

Electric Holdings Limited.—Holding and Investment Company, which controls:—

Airship Guarantees Co., Ltd.—Retained for registration purposes only.

The Broadway Finance & Investment Co., Ltd.—Holding and Investment Company.

Steel Investments Limited.—Investment Company.

Manufacturers Estates & Assets Co., Limited.—Estates Company, which controls:—

Ise of Walney Estates Co., Ltd.—Estate Company, which in its turn controls:—

The Barrow & District Permanent Benefit Building Society.—Building Society.

E. Agency, etc., Companies:—

British Australasian Tractor Co. (Proprietary)

Ltd. (through the Broadway Finance & Investment Co., Ltd.) formed for trading in Agricultural Tractors—business now being wound up.

Vickers & Metropolitan Carriage (South Africa) Ltd.—Agency Company.

Vickers (India) Limited.—Agency Company.

It will be apparent from the foregoing statement that the following are the concerns engaged either wholly or partially in the manufacture of munitions of war in which either Vickers Limited or Vickers-Armstrongs Limited has a controlling interest, although it is to be noted that many of the Companies mentioned have important commercial interests:—

Vickers Limited.

Vickers-Armstrongs Limited.

Vickers (Aviation) Limited, and The Supermarine Aviation Works (Vickers) Limited.

Vickers-Armstrongs Limited.

English Steel Corporation Limited.

S.A. de Placencia de las Armas (through

The Placencia de las Armas Co., Limited).

The Thames Ammunition Works Limited.

The Whitehead Torpedo Co., Limited.

It may be mentioned here that in the information furnished to the Commission particulars regarding S.A. de Placencia de las Armas, have been omitted, since all that Company's manufacturing and trading activities are centred in Spain.

Foreign Interests.

The foreign armament investments of the Group are as under:—

Japan.

1. 25 per cent. of the capital of Kabushiki Kwaisha Nihon Seikoso, a Company engaged in the manufacture of ordnance and shipbuilding material machinery, etc.

2. 20 per cent. of the capital of Wanishi Kozan Kabushiki Kwaisha which is, since the recent sale of iron and steel plant to the Nihon Seitetsu Kwaisha, mainly a holding company.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

Spain.

1. 21 per cent. of the capital of La Sociedad Espanola de Construcción Naval, a Company mainly engaged in armament and shipbuilding work. Vickers-Armstrongs Limited, jointly with John Brown & Co., Limited, are Technical Advisers to La Sociedad.

2. S.A. de Placencia de las Armas holds 22 per cent. of the issued capital of Experiencias Industriales S.A., a Company engaged in the manufacture of armaments and commercial electrical work.

Roumania.

Electric Holdings Limited has an investment of 13½ per cent. of the issued capital of a holding Company domiciled in Monaco and called Cie Europeenne de Participations Industrielles, which Company has an interest in Acieries et Domaines de Resita, an important Company in Roumania engaged in the heavy industries and the manufacture of armaments.

An investment of 20½ per cent. of the issued capital of Uzinele Metalurgice Copsa Mica si Cugir is held by Vickers-Armstrongs Limited, such having been received as consideration for machinery supplied.

The only foreign investments, other than those mentioned specifically above, are in Companies engaged in electrical undertakings and the manufacture of commercial products.

A great deal has been written regarding the supposed ramifications of the Vickers Group, the implication being that it has worldwide connections, control over many foreign Companies, and in short, is a member of what has been styled "An International Armaments Ring." Such views, while no doubt quite sincerely held, are based upon a complete misapprehension of the actual facts as will be demonstrated by the statement of the present composition of the Vickers Group and of its foreign interests given in this memorandum. It is desired to state now, however, that Vickers Limited and/or its Subsidiary and Associated Companies, are not members of an international armaments ring, neither do they control any foreign companies whatsoever either by shareholding, by nomination of Directors or by agreements in any form. The Placencia de las Armas Co., Limited, is a British registered Company and controls S.A. de Placencia de las Armas, a Spanish company having small works in Spain primarily for the production of arms.

1847. *Chairman:* Thank you. I will ask Sir Charles Craven to deal with the next Statement. Sir Herbert, if you wish to add something to the printed statement, now is the time to do it, please.

Sir Herbert Lawrence: With your permission, Sir, I do not desire at this stage to make any lengthy supplementary statement, particularly as my companies have endeavoured to supply to the Commission all the information and particulars for which they have been asked. The Vickers group of companies have been anxious from the outset of this inquiry to afford all information which it lay within their power to supply to assist the members of the Commission in arriving at their recommendations on the reference which has been made to them, and I trust that the Commission holds the view that my companies have endeavoured to be helpful.

At the same time, I should like to address you quite shortly on a few matters which appear to me to be of major importance.

1. THE COMPOSITION OF THE VICKERS GROUP.—The Commission will appreciate that in the case of an organisation of the size of the Vickers group events happen from day to day which in some way or other affect the structure of the group and the investments held by the various constituent companies. In this connection a supplementary statement*

giving a note of the changes which have taken place was sent to the Commission and no doubt has been before the members. There is one matter, however, to which I would make reference which has materialised since that supplementary statement was sent in. In view of the acquisition by Vickers Limited of the whole of the capital of Vickers-Armstrongs Limited and the elimination thereby of outside shareholders in that company, Vickers-Armstrongs Limited was, on the 19th December, 1935, changed from a public company to a private company, and on the 1st January, 1936, the board of the company was reconstituted and to-day is as follows:—

Commander Sir Charles Craven, R.N. (*Chairman*).

General Sir J. F. Noel Birch.

Mr. J. Callander.

Sir A. George Hadcock.

Mr. F. C. Yapp.

Mr. J. Reid Young.

It will be seen therefore that the following directors who sat on the board of Vickers-Armstrongs Limited as nominees of the Armstrong Whitworth interests, namely:—

Sir James A. Cooper,

Major-General G. P. Dawday,

Sir Otto Niemeyer,

have now retired from the board.

The Union of Democratic Control made extensive reference to what have been termed the world wide ramifications of the Vickers group and in support of the statement has furnished to the Commission a chart setting out these supposed ramifications. In regard to this I assume that from a perusal of the statement* of the structure of the Vickers group with the supporting documents put forward by Vickers Limited the members of the Commission will be convinced of the misleading nature of the chart prepared by the Union of Democratic Control.

2. RELATIONS OF VICKERS LIMITED WITH VARIOUS BANKING HOUSES.—I joined the board of Vickers Limited in 1921, at the request of the then board of Vickers, in order to advise upon financial matters.

Glyn Mills & Co., of which bank I am a managing partner have been bankers to Vickers Limited since 1869 and have also been trustees to the debenture holders and registrars for a very considerable period. Glyns appear as owners of a large block of shares in Vickers-Armstrongs Limited but such shares are held as trustees for the debenture holders of Vickers and the bank has no beneficial interest in the security. Except as appears above the relations between Glyns and Vickers have throughout been purely those of banker and customer.

It happens that I am also chairman of the London Committee of the Ottoman Bank and the Bank of Roumania and was chairman of the Anglo-International Bank. None of these institutions has any business relations of any importance with Vickers though naturally it is possible that from time to time either the Ottoman Bank or the Bank of Roumania may have been instrumental in purchasing currency in either Turkey or Roumania for Vickers Limited.

As regards the shareholding in the Anglo-International Bank, 8,625 shares were acquired in exchange for 5,750 shares in British Trade Corporation, Limited, formed on the recommendation of a committee appointed by the Board of Trade, and the balance was received in June, 1923, from the Metropolitan Carriage Wagon and Finance Co., Limited, when Vickers Limited took over the cash and investments of that company.

3. RELATIONS WITH THE SUN INSURANCE COMPANY.

—In 1926, discussions took place between Vickers and Armstrongs with reference to the surplus

* Not printed.

* See p. 350.

8 January, 1936.]

General The Hon. Sir HERBERT A. LAWRENCE, G.C.B.,
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

[Continued.]

capacity for production which was lying unemployed in both firms. It was quite obvious that there was not sufficient work to go round and some sort of amalgamation and concentration of plant was essential.

A joint committee of the two companies presided over by Lord Plender reported, in June, 1927, that the fusion of the armaments interests of the two concerns was essential and could only be carried out with the co-operation of the Government. It was proposed that the Government should be asked to pay, for a fixed number of years, a sum to be agreed, by way of rental, for shops which would have to be closed, and which would be kept by the amalgamated firms in suitable condition to resume work when required. Upon the committee's report being submitted to the Chancellor of the Exchequer, he replied to the effect that while the Government was sympathetic towards the scheme, no financial help could be afforded.

The matter was then discussed with the Governor of the Bank of England, who, in view of the approval in principle intimated by the Chancellor and in order to assist the rationalisation of the iron and steel industry and to avoid the increase of unemployment and disturbance of labour which would have been made inevitable by the closure of works consequent on the appointment of a receiver for Armstrong Whitworths, agreed to provide, through an intermediary, a sum of £200,000 a year for five years in any year in which the profits of the new company, Vickers-Armstrongs Limited, fell below £900,000. The intermediary for the purpose of this transaction was the Sun Insurance Company.

While the process of rationalisation was going on (during the five years from 1925 to 1932), a sum of £200,000 a year was received by Vickers-Armstrongs. That company is under an obligation up to 1947 to repay this out of an agreed portion of the profits in excess of a sum of £900,000 in any one year.

4. **SIR BASIL ZAHAROFF.**—There have been many references in the course of the American Inquiry and by witnesses before your Commission connecting Sir Basil Zaharoff with Vickers. I think it will dispose of much misunderstanding and misrepresentation in this connection if I briefly state the facts. Since at least 1924 Sir Basil has taken no part whatever in the affairs of the Vickers companies with the exception of retaining an interest in regard to Spanish matters. The only company in the Vickers group of which Sir Basil is a director is The Placencia de las Armas Co., Limited, in Spain. Sir Basil takes no part in the management of the affairs of Vickers Limited, or any company in the group with the exception of Spanish matters referred to above.

5. **VICKERS - SCHNEIDER.**—Some misapprehension exists owing to the inclusion of the name Vickers-Schneider in the list of companies mentioned in the first part of the Fifth Schedule to the Amalgamation Agreement between Vickers and Armstrongs. In fact this was an error in drafting which was overlooked at the time, and no such company as Vickers-Schneider has ever existed or was contemplated. There was an agreement, however, which should have been included in the schedule in question under a proper description, which provided that Vickers and Schneiders would render technical assistance and provide certain machinery to a Polish company named Société des Etablissements Minière de Starachowice.

This last mentioned company was formed under the auspices of the Polish Government, which subscribed for a proportion of its capital, and was granted by that government the right of priority for the manufacture of certain types of armaments.

6. In conclusion, I should like to say how much I and my co-directors still hope the members of the

Commission may be able to adopt the suggestion, which I made in my letter to your Chairman in February last year, that they should visit all or certain of the works belonging to the Vickers group, because I feel sure that such a visit would be useful to the members of the Commission in so far as they would see for themselves the actual equipment and organisation of the works as well as the types of armament and commercial manufactures being carried on in the various establishments.

With your leave, Sir, that is all I wish to say.

1848. **Chairman:** Thank you. I want to ask a few questions about this Spanish company. You have indicated the companies in which Vickers Limited or Vickers-Armstrongs have a controlling interest. Then amongst the companies you have mentioned this Spanish company and at the bottom of the same paragraph you say that that is "a British registered company and controls S. A. de Placencia de las Armas, a Spanish company having small works in Spain." It appears from this statement that this small Spanish company is one of the companies in which you have a controlling interest; but you do not give us any particulars about that company, the extent of its business or the details of its business; and the reason you give is that their trading activities are centred in Spain. But I think the Commission would like to have the same sort of particulars about this company that you have given us about the other companies in which you have a controlling interest.

Sir Herbert Lawrence: May I ask your leave, Sir. I would like Sir Charles Craven to answer that question because he has been a director of these companies.

Sir Charles Craven: This company to-day is employing 250 people. We will certainly bring all the details to-morrow morning, if that will do. It is really purely manufacturing armaments for the Spanish Government. A lot of their orders come in via the main company, but, as I say, it has an employing capacity to-day of 250.

1849. **Mr. Spender:** It has never been used for what may be the suspicion in some people's minds—the export of armaments without licence?

Sir Charles Craven: Certainly not since I have been in the company, and I do not believe it ever has.

1850. **Chairman:** You have stated that Vickers and its associated companies "are not members of an international armaments ring, neither do they control any foreign companies whatsoever" and so forth. I am not suggesting that here there is any inaccuracy about "an international armaments ring"; but it is a fact, is it not, as appears in some of the evidence we have had, that practically all the iron and steel companies that manufacture in England are now associated in some form of combination, for the purpose of controlling prices and regulating areas and so forth?

Sir Charles Craven: Yes, Sir; as part of the International Cartel, you mean?

1851. **Chairman:** I have the names here. For instance, there are Federated Forgemasters.

Sir Charles Craven: That is British.

1852. **Chairman:** Midland Forgemasters.

Sir Charles Craven: British.

1853. **Chairman:** English and Scottish Forgemasters; Forgemasters' Convention, both English and Continental Groups; the Railway Tyre and Axle Makers' Association; the Special Billet and Gun Forgings' Association; the Steel Manufacturers' Nickel Syndicate—we know about that—the Forging Ingot Makers' Association; the Heavy Steel Castings Association; the Roll Castings Association; the English and Scottish Steel Founders' Association; the Turbine Castings Association; and the Cast Steel Wheel Centres Association?

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: Yes.

1854. *Chairman:* It is a fact, is it not, that those associations do embrace practically all at any rate of the important firms engaged in iron and steel manufacture in England?

Sir Charles Craven: In this country.

1855. *Chairman:* And that is for the purpose of regulating prices and controlling areas and so forth?

Sir Charles Craven: Yes, Sir, and in some cases for interchange of technical information.

1856. *Chairman:* Now, Sir Herbert, if you will allow me, there is one more set of questions I want to ask—about these Japanese investments. They are 25 per cent. in one company and 20 per cent. in another company. Then there is 21 per cent. in a Spanish company. Do those holdings enable Vickers Limited or Vickers-Armstrongs in any way to control the operations of those companies, or is it merely investment?

Sir Herbert Lawrence: No; they control them in no way. It is merely investment. We have a representative on the board of the Spanish company, but that is all. In fact, the Spanish company is in very considerable trouble; it owes Vickers a great deal of money.

1857. *Chairman:* Now, if I may go to Statement No. 1,* Sir Herbert. You say "Research work is going on continuously in factories of the Vickers group." Can you give any indication or idea of the number of persons employed in research in the group?

Sir Herbert Lawrence: I could tell you the amount of money which has been spent in the last five years. It is roughly £1,000,000. We spend about £200,000 a year on research. I could give you the number of men employed if you wish it.

Chairman: Oh, no. That gives us an idea.

1858. *Sir Thomas Allen:* Is that expenditure for all purposes of your production?

Sir Herbert Lawrence: Yes, practically for all purposes, because it is so mixed up, the armaments side with the commercial side.

Sir Charles Craven: I think that is a very modest figure of what we actually do in the way of research. It does not include a good deal of research expenditure on the production side.

1859. *Professor Gutteridge:* Have you a separate research staff?

Sir Charles Craven: Oh, yes; in each of the companies.

1860. *Chairman:* I understand from your statement that the research in your industrial part is really of essential value in your armaments part of the business?

Sir Herbert Lawrence: Undoubtedly; the whole tendency is for these special tests to be used both in commercial work and in armaments work, and the research work that is done for one is of infinite value for the other.

1861. *Chairman:* You refer to the demand from abroad which has resulted in this anti-aircraft gun. Is it possible to give any information as to how much of the expenditure which we are told has been made in the last five years upon armaments has been expenditure upon that gun?

Mr. Yapp: Do you mean how much of the research work?

1862. *Chairman:* No. I mean how much has been expended on the making of the gun.

Sir Charles Craven: That gun was developed before the last five years.

1863. *Chairman:* I was wondering what proportion of the expenditure on armaments work was expenditure upon this gun.

Sir Charles Craven: A good deal.

Mr. Yapp: Do you mean the value of the contracts received for the gun?

* See p. 347.

1864. *Chairman:* No. We have been given the figures of expenditure upon armaments work in different years and I was wondering how much of that expenditure was attributable to this gun, which is a defensive weapon.

Mr. Yapp: In the development of that equipment, we have spent, I should say, something in the neighbourhood of £100,000.

1865. *Chairman:* That is in developing it?

Mr. Yapp: Yes.

1866. *Chairman:* But after it has been developed, how much of the expenditure on armaments has been expenditure upon making the gun?

Mr. Yapp: Do you mean against contracts received? We do not make the gun for stock, you understand.

1867. *Chairman:* No. I mean for supplying it under contracts.

Mr. Yapp: We have received contracts amounting to many hundreds of thousands of pounds for this gun from various foreign countries.

Secretary: I think that what the Chairman means is what proportion of the turnover figures relates to that gun.

Mr. Yapp: We can give you that figure.* It amounts to many hundred of thousands of pounds.

1868. *Chairman:* A feature is made in your statement about the demand for this gun and we have also the turnover on armaments and I would like to know how much of the turnover is for this gun, or is attributable to this gun.

How much of the turnover that we have been given for recent years includes ships—I mean warships? The cost of warships is so great that it might be that a very large proportion of the turnover in a given year was perhaps the cost of a warship?

Sir Charles Craven: We have not brought with us the figures for the past but the position today is that in all the works of Vickers-Armstrongs we have a balance of work ahead—that is the orders booked, less expenditure—at this moment of £11,459,000. Of that, warships are £3,563,000.

1869. *Chairman:* Warships?

Sir Charles Craven: Warships. That is the hull and machinery of the warship as apart from the armament of the warship. The armament is a separate contract and goes into the armament side. Of the warship figure £2,454,000 is British, £1,208,000 is foreign. On the armament side the British is £6,360,000 and the foreign is £1,435,000. That is warship and armament work. The armament side includes military as well as naval, but in a ship we always talk of the hull and machinery as quite separate. We call that the ship.

1870. *Sir Thomas Allen:* Those figures indicate a vast increase over the production in 1934?

Sir Charles Craven: Yes. There is a considerable increase in orders booked. This is not production. This is a statement of orders booked.

Sir Thomas Allen: Of potential manufacture.

1871. *Chairman:* That is the present position. We have statements of turnover that you have given us. In Appendix 1† you have given us the turnover for the years 1930, 1931, 1932, 1933 and 1934. Then you have given us the total turnover for each company; the percentage attributable to armaments; the percentage of armaments, British Empire; the percentage of armaments, foreign. The total turnover for, we will take Vickers-Armstrongs Ltd., in 1930 was £7,626,000. Is a considerable amount of that attributable to warships?

Sir Charles Craven: Yes. But the warships as defined in your questionnaire are in armaments.

1872. *Chairman:* Yes. I know. That is a very large amount of turnover; but of course one single ship represents a very large proportion of the total output, does it not?

Sir Charles Craven: Yes.

* See Appendix 12, p. 419.

† See p. 402.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

1873. *Chairman*: I was wondering how much of the total turnover that you have given us is attributable to warships.

Sir Charles Craven: Do you mean the hull and machinery of a warship apart from its armour and armament?

1874. *Chairman*: No, including the armament.

Sir Charles Craven: It will take a little time but we will get that out.

1875. *Chairman*: Thank you.

Sir Charles Craven: Do you want it for each of those years? You ought to have it for each of the years, to give you an idea.

1876. *Chairman*: Yes.

Sir Charles Craven: Of course, the difficulty is that the British Admiralty do not order a cruiser complete. They order the hull, the machinery, the armour, the guns, the sights, the gun mountings and all that, on separate contracts.

1877. *Chairman*: But it is quite possible to add it all up and see what the ship costs.

Sir Charles Craven: Yes, but perhaps we do not get the whole order.

1878. *Chairman*: I only want the proportion representing what you do get.

Mr. Yapp: It is rather difficult.

Sir Charles Craven: In a foreign ship it is complete; there is one contract for the whole lot.

1879. *Professor Gutteridge*: You supply the ammunition, do you not, in the case of a foreign ship?

Sir Charles Craven: In some cases they insist that we do.

1880. *Mr. Spender*: If you have an order for a foreign ship there is one contract for the whole of it?

Sir Charles Craven: As a rule.

Mr. Yapp: It may not be. It may be that the hull and machinery is ordered from one ship-builder and we supply the armament.

1881. *Mr. Spender*: You mean for the foreign ship?

Mr. Yapp: Yes.

1882. *Chairman*: What is in my mind is this. There is a very large expenditure on armaments, which includes for this purpose warships.

Mr. Yapp: Yes.

1883. *Chairman*: And it gives the impression that there is an immense amount of offensive war material being manufactured and perhaps sent abroad, or kept in this country, but of course when you take warships that is an item that in itself is very expensive.

Mr. Yapp: Quite.

1884. *Chairman*: Every warship for which you get an order accounts for a considerable proportion of the total turnover?

Mr. Yapp: Yes.

1885. *Chairman*: I was wondering if it would be possible to ascertain how much of this turnover is attributable to warships and how much is left for the rest of the expenditure on armaments.

Sir Charles Craven: That would be quite easy.

Mr. Yapp: It would be quite easy to divide these figures between naval and military armaments.

Sir Herbert Lawrence: Would that meet the point, Sir?

1886. *Chairman*: Yes.

Mr. Yapp: I could give that information* very quickly, for the naval and military.

Sir Herbert Lawrence: We could give you a figure for it now but the actual military part is extraordinarily small. It is nearly all naval.

Sir Charles Craven: I think I know what you mean, Sir. I have a sailing training ship down here as a warship for armaments for Brazil. She would not dare to enter into an engagement with anybody.

1887. *Professor Gutteridge*: For the purposes that you have suggested, Mr. Chairman, that would be included.

Mr. Yapp: That would come into the naval side.

1888. *Chairman*: With reference to licensing, you say: "... the commet has been made that only very few licences have been refused." Then, later on: "This circumstance is capable of a very simple explanation. Very many inquiries are received from abroad which are, obviously, undesirable." Are any records kept of the applications that are made and are not proceeded with on the ground of their obvious undesirability?

Mr. Yapp: Do you mean, Sir, have we any records of inquiries that we receive from abroad that we do not consider desirable to deal with?

1889. *Chairman*: Yes. Could you supply them for the last five years?

Mr. Yapp: Yes, Sir, for the last five years.*

1890. *Chairman*: Now, Sir Herbert, may I ask you to turn to Statement No. 2,† where it is stated that "in regard to many of the large Government contracts, before prices are agreed in respect of the supplies involved, a thorough examination of charges, and of estimates of materials and wages, is made by the Government departments concerned." Would there be any objection on the part of your associated companies in the case of any Government order that there should be permission given for the completest examination, and costings taken out with regard to the cost of executing the proposed order?

Sir Charles Craven: Wherever there is a monopoly business, the Government departments have that right. If we are doing work for the War Office that is something special—I am thinking of a big contract we have in hand now—we prepare an estimate and they prepare an estimate; they have full access to our establishment charges, and then an agreed percentage is applied and we build up a price. That is the maximum price that we are allowed. Then they put us on to "time and line"—as it is called, and they net cost the whole thing from beginning to end. They get all the savings, and if we exceed that agreed maximum price, we bear the excess.

1891. *Chairman*: Does that apply to all Government orders?

Sir Charles Craven: No, Sir, only where there is a monopoly.

1892. *Chairman*: What do you mean by monopoly?

Sir Charles Craven: By our having a monopoly I mean where we are the only firm which could manufacture certain products by virtue of possessing the very special plant required for the manufacture of those products.

Government departments concerned are constantly investigating our establishment charges. In cases where other firms are competing for a contract, I wish to make it clear that when once a Government department accept the price of the successful firm, the Government department does not investigate the cost; because obviously, if they did, they would have to bear any increase in wages and material which occur during the course of the execution of the contract.

1893. *Chairman*: And the check on prices in these cases is by tender?

Sir Charles Craven: Yes.

1894. *Chairman*: By comparing tenders?

Sir Charles Craven: Yes. I wish to make it clear that whenever there is no genuine commercial competition for any of our products, the Government have a check on us either through the Royal Dockyard costs, or through the competitive costs at Woolwich Arsenal, with the one exception of non-transferable naval mountings where we are the only firm who have the plant and experience for their production. In the case of these mountings, the

* See Appendix 13, p. 420.

* See Appendix 14, p. 421.

† See p. 371.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

fullest technical estimating is carried out by a Government expert staff, and we again give full information regarding establishment charges.

1895. *Sir Thomas Allen*: We have been told there is no organised costing within the three services of the Government. I presume you would have a private costing system within the ambit of your association?

Sir Charles Craven: That is so, sir. We think it is very good.

1896. *Sir Thomas Allen*: I have no doubt it is.

Sir Charles Craven: The Government departments which I deal with have a very efficient system of checking us, and estimating, and of checking the costings too.

1897. *Chairman*: You put the case where there is a monopoly. Have your association of firms a monopoly in a special range—if that is the right word—of armaments?

Sir Charles Craven: The only item is what is known as non-transferable mountings.

1898. *Professor Gutteridge*: Have you not got a virtual monopoly in tanks?

Sir Charles Craven: I should not call it a monopoly. We are actually doing most of the tanks which are done by private firms.

1899. *Professor Gutteridge*: You do not regard it as a monopoly in fact?

Sir Charles Craven: Why do you say that?

1900. *Professor Gutteridge*: I just want to see if I understand this point correctly. Are what you call the monopoly items limited to cases in which you have a master patent?

Sir Herbert Lawrence: No, it is only there where we have to maintain the special plant for it—such as for big mechanical mountings.

1901. *Chairman*: I have already referred to the large number of associations covering the iron and steel trades. Is there any real competition in any cases where you have not got a monopoly?

Sir Charles Craven: I think Mr. Dunbar of the English Steel Corporation, who knows all these arrangements in the British steel industry, can answer that question.

Mr. Dunbar: The associations of which you speak are only to a very small extent connected with armaments, and there is virtually no competition between the members. The prices are arranged in each case with the knowledge of the Government departments concerned, and in all cases the Government have the right, and exercise the right, of investigating the costs of any individual producer. They also discuss with the association, and consult with the association as an association, or with any individual producer in the association.

1902. *Mr. Spender*: When you say that prices are arranged, do we understand you to mean that there is a common price, that there is only one price?

Mr. Dunbar: Yes, one common price. That is almost an invariable rule.

1903. *Mr. Spender*: So that in effect all competition is eliminated by that method?

Mr. Dunbar: All competition is eliminated. Within the last few years free and open competition and increasing competition has had a disastrous effect on all concerned, and would, unless checked, have ultimately resulted disastrously to the British steel industry as a whole.

1904. *Sir Thomas Allen*: You think Great Britain was in danger of being detrimentally affected by this competition?

Mr. Dunbar: Yes. If you take the case of one particular commodity only, gun billets are very little different from billets sold by hundreds of thousands of tons for commercial purposes. They are one particular composition which can be made by a number of steel makers, and the Government has been in the habit of putting them out to open tender. The tonnage involved in each order would be quite considerable and would help to keep the

plant employed and in the circumstances which have existed in the last two or three years there has been a great deal of competition for such orders.

1905. *Professor Gutteridge*: Does the international cartel enter into that at all, as far as armaments are concerned?

Mr. Dunbar: No, armaments are quite outside the cartel.

1906. *Chairman*: Then you say: "Similarly, there is no doubt that the very heavy forgings of special alloy steel required by Imperial Chemical Industries for the new plant at Billingham recently erected for the production of oil from coal by the hydrogenation process could not have been manufactured without the accumulated knowledge of the three principal forgemasters". Who are they?

Sir C. Craven: The English Steel Corporation, which comprises the steel interests of the old Vickers, Armstrong Whitworths and Cammel Lairds; and the other two are Firth Browns and Beardmores. They represent about 80 per cent. of the forgemasters' capacity in the industry.

Chairman: I think that exhausts the questions that I wanted to put to Sir Herbert, because all the other questions of a concrete nature that I want to put I shall want to put to you, Sir Charles, in due course.

1907. *Dame Rachel Crowdy*: You were speaking of research just now. Can we be told what Vickers do about inventions made by their employees? Are inventions and improvements made by their employees rewarded in any way?

Sir Charles Craven: This is an extract from a works order:

"(1) All patents are to be taken out in the joint names of the inventor and the company. (2) Inventions made by employees which are of a nature allied to products already manufactured by the company must be assigned to the company, who may reward the inventor at their discretion in the event of such inventions proving a source of profit to the company. (3) Inventions made by employees which are not of a nature allied to products already manufactured by the company must be offered in the first place to the company, who, in the event of acceptance, will reward the inventor provided such inventions prove to be a source of profit to the company."

The difference between the two is that it is a matter of private business in one case, and in the other it is not. Apart from this, I think Admiral Bacon referred to this matter. In any decently constituted private works the people are encouraged to come forward with their ideas, and in all our works we have committees presided over by a very senior manager. For instance, at Barrow the manager of the engineering works, one of our local directors, presides over this committee; and then, if it is a large matter, it comes to me. He has authority to give up to a small amount, but for larger amounts he comes to me. I know of two or three cases at any rate in the last few years. One was a very small thing, and it was a matter which did not suit our machinery. We did all the development, and the man who made the invention received 75 per cent. of what we got out of it.

1908. *Dame Rachel Crowdy*: Have you any idea of what has been spent on rewards, in the last three years, say?

Sir Charles Craven: Not very much. There have been very few outstanding inventions in the last year or so.

1909. *Dame Rachel Crowdy*: We have heard so much lately in evidence to the effect that, under a State monopoly, inventiveness would not be so frequent. There is not so much enthusiasm in Government service, it is said, about inventions, and I was wondering how the private firms create the enthusiasm of which we hear so much.

Sir Charles Craven: We encourage our people, as I have said, but the fact remains that we have

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

not had any inventions in the last few years of an outstanding nature. Then there is another point, and that is this, that in a private firm I think probably the best reward a man can get is promotion in his own firm.

1910. *Dame Rachel Crowdy*: By making himself really useful?

Sir Charles Craven: Yes, by making himself useful.

1911. *Dame Rachel Crowdy*: Going back to what you said just now about competition, I do not know whether you can answer this question in public. You have answered it partly. Are you in competition with private manufacturers in this country, and can you give us the names of the firms with whom you are actually in competition?

Sir Charles Craven: I am afraid I should have to look that up for you, but it is all the leading shipbuilders, in respect of warships, and, for example, there are only the three forgemasters whom I have just mentioned who make the marine forgings, which are an important part of the ship. There will be the three leading forgemasters and several small firms.

1912. *Dame Rachel Crowdy*: It would be very interesting to have it.

Sir Charles Craven: I think we have given it in our reply to the questionnaire.

Chairman: Yes, it has been given.

Secretary: I think what *Dame Rachel* must mean is: With which of those firms do you really regard yourselves as being in effective competition?

1913. *Dame Rachel Crowdy*: Yes, with which are you in competition, and with which are you in co-operation.

Sir Charles Craven: We are in co-operation in practically all cases—not all, but nearly all.

1914. *Dame Rachel Crowdy*: I am now rather following up the question of monopoly which you were dealing with just now. It will be interesting to know what are the monopoly sections.

Sir Charles Craven: I think when *Sir Herbert Lawrence* used the word "monopoly" he was using it in connection with one firm.

Sir Herbert Lawrence: That is so.

1915. *Dame Rachel Crowdy*: I appreciate that, but I wanted to find out exactly what firms are in actual competition with you.

Sir Herbert Lawrence: For guns and mountings?

1916. *Dame Rachel Crowdy*: Yes, or any other material which you manufacture. I do not press it at the moment, but if you can let the Commission have it I shall be grateful. We have not got that at the moment.

Sir Herbert Lawrence: I think if you were to take the names which have been given in our written statements that would cover it.

1917. *Dame Rachel Crowdy*: We have had some of the names, but not all, I think.

Sir C. Craven: For instance, there is the B.S.A. Company.

1918. *Dame Rachel Crowdy*: I have only one other question at the moment. The Chairman raised the question of licences, you will remember. I am naturally very interested, as an ex-League of Nations official, in the various discussions that have come before the League of Nations. Can you give us any idea of the quantity of armaments that your firm has exported, say to Japan, between September, 1931, and April, 1933, and to Bolivia and Paraguay from July—

Sir Charles Craven: May I take those dates down? I do not know that we have the details here. Yes, I am told that we have got it here.

Sir Herbert Lawrence: What was the first question?

1919. *Dame Rachel Crowdy*: The first was from September, 1931, to April, 1933—that is, in fact, from the time of the Shanghai incident to the taking over of Jehol by the Japanese.

Sir Herbert Lawrence: We have only got them as orders received.

1920. *Dame Rachel Crowdy*: Can you let me have the orders satisfied?

Sir Charles Craven: Yes, we can get them. 1921. *Dame Rachel Crowdy*: Then my second question is Bolivia and Paraguay between July, 1932, and Christmas, 1934, and then to Colombia and Peru between Christmas, 1932, and July, 1934, and to Italy between September, 1934, and June, 1935; and, if it is not too much trouble, I should be very glad if you could let us know at some time how many separate export licences you had covering any shipments you made.

Sir Charles Craven: To those countries?

1922. *Dame Rachel Crowdy*: Yes, in those periods to those countries.

Sir Charles Craven: Yes. We will let you have those.*

1923. *Chairman*: There is one question I wanted to ask you, and I am reminded of it by a question put to you by *Dame Rachel Crowdy*. It is in connection with what Mr. Pollitt said in his evidence.† The question was asked whether any of your companies were supplying any armaments to Germany, and the answer was that it was done with the complete approval of the Government. Do you know whether—

Sir Herbert Lawrence: May I say what really happened. Miss Rathbone asked a variety of questions and I answered most of them, and I told her in the opening part of the discussion which occurred that, as far as I knew, we had exported nothing to Germany. Then she asked subsequently: Could I assure her that in no circumstances had any of the arms we had exported elsewhere gone to Germany. It was my answer to that question to which I think you refer. I said that while I could give her the assurance that we had sold nothing directly to Germany, I could not say that, if we had sold a gun say to Brazil, Brazil had not sold that gun to Germany.

Chairman: That explains the position. I am much obliged.

1924. *Dame Rachel Crowdy*: Can we get any idea of the amount of money that you spend on press advertising?

Sir Charles Craven: I can get that quite easily.

Sir Herbert Lawrence: We have given it, I think. The figures are actually given in the schedule.

Chairman: We have got the actual figures.

1925. *Dame Rachel Crowdy*: I really wanted to get what is the amount spent by Vickers and I.C.I. combined on that; but I can bring that question up later.

Sir Charles Craven: The I.C.I. I cannot speak of. Do you mean the English Steel Corporation?

Dame Rachel Crowdy: No; I want to get all the companies together, and therefore I want further figures from you.

1926. *Sir Kenneth Lee*: In your statement you say that in the event of a long war it would be possible for the Government to take over the munitions firms, just as they took over the railways in the last war. Would you consider that desirable.

Sir Herbert Lawrence: I think it might lead to a simplification of the various troubles which occurred in 1914. I do not think it would be desirable unless the management were left in the hands of the private firms. On the other hand, it would simplify all questions of illegitimate profits being made through war. The excess profits duty, you will remember, was introduced during the War to prevent anything of that kind, and it resulted in tremendous confusion. If the Government had taken it over, as they did the railways, it would have saved all that trouble.

* See Appendix 15, p. 425.

† Minutes of Evidence, Day 3, Appendix, p. 72.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

1927. *Sir Kenneth Lee*: Then they could conscript all the people, from the managing director down?

Sir Herbert Lawrence: Yes.

1928. *Sir Kenneth Lee*: And they would get a better control?

Sir Herbert Lawrence: Undoubtedly; yes.

1929. *Sir Kenneth Lee*: Then you think that it would be desirable?

Sir Herbert Lawrence: I think it would be desirable, on the whole; because I think, partly from the point of view of efficiency and partly from the point of view that it would relieve the armament people from the odium of making excessive profits, that it would be better.

1930. *Sir Kenneth Lee*: Then, General Lawrence, the Vickers Company started in 1867 with a capital of £155,000, and the capital has been increased gradually. Can you say whether it was increased by the company giving bonus shares, or was it increased by public subscription, or by fresh money being put in?

Sir Herbert Lawrence: Mostly by fresh money, but I think there were two cases in which bonus shares were issued. I shall have to look that up.

Secretary: There are two mentioned in the list, in 1895 and 1896.

Sir Herbert Lawrence: Yes.

1931. *Sir Kenneth Lee*: From the statement, it does not seem clear what the proportion was.

Sir Herbert Lawrence: I will have that looked up.

1932. *Professor Gutteridge*: There are two bonuses referred to, in 1895 and 1896. Are they the only ones?

Sir Herbert Lawrence: I think so. I will have it looked up. There seem to have been three cases, Sir. There was a bonus issue in 1871 of £155,000 in respect of the writing up of the Brightside Works by £80,000 and transfer from reserves of £75,000; 5,000 bonus shares of £50 each were issued in 1881, £200,000 being in respect of a revaluation of goodwill and £50,000 being taken from Reserve; while 75,000 bonus shares of £10 each were issued in 1887 again arising from the writing up of fixed assets including goodwill.

1933. *Sir Kenneth Lee*: I see those are mentioned in your statement. The reference is made to old shares and new shares there. Those are partly bonus shares?

Sir Herbert Lawrence: Yes.

1934. *Sir Kenneth Lee*: And in 1899 there is the same thing, old shares and a new issue?

Mr. Reid Young: Yes.

1935. *Sir Kenneth Lee*: I wanted to make sure whether it was a new issue for cash, or a new issue for bonus.

Sir Herbert Lawrence: They are mostly bonus shares.

Sir Charles Craven: No, they were not.

Sir Herbert Lawrence: Your question is whether they were bonus shares or whether they were issued for cash?

1936. *Sir Kenneth Lee*: Yes—whether it was new money put in.

Sir Herbert Lawrence: The money was provided from the new shares that were issued.

1937. *Sir Kenneth Lee*: With a new firm you would not necessarily issue shares to the public?

Sir Herbert Lawrence: In getting the money concerned, do you mean?

1938. *Sir Kenneth Lee*: Yes.

Sir Herbert Lawrence: In the case of the Metropolitan Carriage Company, which was a very large transaction, the greater number of shares were acquired by Vickers Limited for shares of its own issue, but a proportion of the Metropolitan shares was purchased for cash.

1939. *Sir Kenneth Lee*: What I wanted to get at was whether munition making, taking it over a period of years, was a profitable business. I want to get it clear as to whether it is a much less

profitable business than an ordinary industrial undertaking.

Sir Herbert Lawrence: I think I can get that worked out.

1940. *Mr. Spender*: We want some figures apart from the money obtained through dividends, apart from the percentage, which will enable us to compare it with the amount which we have in front of us.

1941. *Secretary*: Is it to be understood that over this period there was in fact no market issue at all, but that the increases in capital were all obtained in some other way?

Sir Herbert Lawrence: No; there were issues of capital.

1942. *Secretary*: Perhaps you will put in a statement?

Sir Herbert Lawrence: Yes, I think we had better have it made out in a statement covering the whole period.*

1943. *Sir Kenneth Lee*: Your offensive weapons, I take it, are never sold abroad until considerably later, after they have been available in this country?

Sir Herbert Lawrence: I do not quite know how to answer that question. Take the case of the anti-aircraft gun, for instance. The Government here have not bought any from us, but we have sold them freely abroad.

1944. *Sir Kenneth Lee*: That is a defensive weapon, is it not? I was thinking more of an offensive weapon.

Sir Charles Craven: Yes, I suppose that would be the correct way to put it.

Sir Herbert Lawrence: We might, for example, develop a field gun of a particular type for a foreign government.

1945. *Mr. Spender*: You would have to inform the Home Government first?

Sir Charles Craven: They are watching you doing it all the time, Sir. There is no secrecy about it. We have 521 government inspectors in our works.

1946. *Sir Kenneth Lee*: But it would be possible for another country to get a more efficient gun than our army, for instance?

Sir Charles Craven: If they had more efficient judges than our Government had, yes. It is all subject to expert observation.

1947. *Sir Kenneth Lee*: And therefore you claim that the fact that you can sell abroad may stimulate design?

Sir Herbert Lawrence: Oh, certainly, without any question at all. I do not think we should have developed this particular anti-aircraft gun which I have spoken of, if we had not had support from abroad.

1948. *Sir Kenneth Lee*: Just one other question. Have you ever had a director of your company on the board of any German organisation?

Sir Herbert Lawrence: Never, as far as I am aware.

1949. *Sir Kenneth Lee*: And vice versa; there is no German director of any munition works on any board of your company, or of its subsidiaries?

Sir Herbert Lawrence: Of what period are you speaking?

1950. *Sir Kenneth Lee*: In recent times.

Sir Herbert Lawrence: No; none.

1951. *Sir Kenneth Lee*: From 1900, we will say.

Sir Herbert Lawrence: I really could not hold myself responsible for what happened before 1921; but I can easily find out if there was. Certainly there has been none in the last 18 or 20 years.

Sir Charles Craven: There was a German-born managing director of Vickers up till 1904 or 1905, but he must have been, I think, a British subject. He was German born. It was before I joined the company.

* See Q. 2539 and Appendix 16, p. 426.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

1952. *Sir Kenneth Lee*: He was not a director of a German munition factory at the same time?

Sir Charles Craven: Oh, no.*

1953. *Mr. Spender*: Just to correct any possible misapprehension, the fact that the Home Government has not bought up anti-aircraft guns does not mean that it has not been providing itself with anti-aircraft guns, does it?

Sir Herbert Lawrence: Oh, no, Sir; they have got an anti-aircraft gun, the one that was used in 1918, as far as I know, and it is a very good gun; but it is not as good as the new one.

1954. *Mr. Spender*: That is possibly a matter of opinion. Now I want to ask you one question on Statement No. 2. You say: "Experience during the late war demonstrated that a private armament firm is peculiarly adapted by its organisation for extremely rapid increase of output." We have had a considerable amount of evidence suggesting that the output of armament firms was rather slow at the beginning of the last war, and that promises made by many firms, including your own, were not fulfilled. We have had put before us rather a formidable list of promises made and of performance.

Sir Herbert Lawrence: I think, if you will allow me, I should like Sir Charles to answer that; but I would make this observation, that I think the majority of those remarks referred to the manufacture of shell and ammunition, which is not really our particular job. However, I will leave it to Sir Charles to answer it more completely.

1955. *Mr. Spender*: I think the statement was made that the number of shells which you undertook to make was far in advance of the number delivered.

Sir Charles Craven: I have covered this in the statement which I was going to submit to you when my turn came. I should like to explain this, that all cases, as far as I can see, have been criticisms of supplies to the Army. The War Office ordered from us on an average between 1910 and 1914 about £55,000 worth of goods a year. The Admiralty in those same years placed orders with us for nearly £3,000,000 a year. I think that is a part of the reason why we could not be expected to have huge plant ready to expand immediately for the War Office; but I think that some figures for the years in question would be of interest. In the ten years ending August, 1914, our deliveries of machine guns to the War Office were just under eleven guns a year—10-9. Between August and December, 1914, we delivered 301; in 1915 we delivered 2,343; in 1916 we delivered 4,670; in 1917, 21,750; and in 1918 we delivered 41,690. That is building up from the pre-war output, at that time, of just over 10 guns a year.

1956. *Chairman*: Your statement also adds that so far as the Admiralty requirements are concerned, you complied with those?

Sir Charles Craven: Yes. I have never heard any criticism of that.

1957. *Mr. Spender*: Would you say the capacity for expansion has improved since the last war? Do you say it is greater to-day?

Sir Charles Craven: With the greatest respect, I do not think I ought to answer that in public. I am perfectly prepared to answer it.

1958. *Sir Philip Gibbs*: Sir Herbert, the members of the Commission I think are reserving questions on rather special points for Sir Charles Craven. May I ask you a few questions on the sort of general argument and charges—because, of course, as you are fully aware, there have been many bitter charges made against the armament firms, and I think perhaps Messrs. Vickers in particular—and I should like you to answer a few questions on those points. The main charge against the armament firms, including Vickers, is that, apart from the private opinions of individuals in those firms, by the very nature of the business you are antagonistic to world peace.

You would not agree with that, of course?

Sir Herbert Lawrence: Most decidedly not.

1959. *Sir Philip Gibbs*: But, on the other hand, you have made certain admissions in statements which you have made to your general meetings. There are several instances. In one of them you say that a reduction in armaments would adversely affect the prosperity of your firm. At the general meeting in 1927 you said: "If there is to be a further limitation of armaments, the future of the armament business of Vickers, like that of every other armament firm in this country, may become difficult." In 1928 you said: "The proposal for unaval disarmament, if successful, will naturally have an adverse effect on the trading results of Vickers-Armstrongs, should any material reduction result." Now that, in lay opinion, is an admission that as a firm, though not as an individual, you are antagonistic to any naval reduction?

Sir Herbert Lawrence: May I put it in this way, that I think that is an incorrect and unfair inference to draw. Quite obviously I do not deny the fact for a minute that Vickers' principal interest is in making armaments and instruments of war; but to infer from that that the board of Vickers is anxious to use them in war is, I think, carrying it too far.

1960. *Sir Philip Gibbs*: Is it carrying it too far to suggest that you dislike the idea of a world naval limitation?

Sir Herbert Lawrence: No, I do not think that that could be inferred at all from my speech. Please remember, Sir Philip, that I was addressing the proprietors, the shareholders, of this company, who want to know the circumstances under which their property is being administered. I endeavoured to explain to them that, if there was a world limitation of armaments, their business goes out as well.

1961. *Sir Philip Gibbs*: I am not, of course, making any suggestion against you as an individual.

Sir Herbert Lawrence: I perfectly appreciate that.

1962. *Sir Philip Gibbs*: But, speaking generally, the charge is that, in a sort of natural and inevitable way, the armament firms must dislike, and perhaps even attempt to prevent, anything like a reduction in arms, either in this country or in the world.

Sir Herbert Lawrence: I may be prepared to admit that people may draw that sort of inference from my remarks—though if they do draw that inference my remarks were interpreted incorrectly—but I was only trying to state a perfectly obvious fact. If the world is to be at peace, it might be, quite obviously, that the business of Vickers, Limited, will disappear. That may be a consummation to be wished for.

1963. *Sir Philip Gibbs*: Of course, you must draw a distinction between your private individual opinion and the interests of the firm.

Sir Herbert Lawrence: Quite so.

1964. *Chairman*: If the demand for your production ceases altogether, then your company comes to an end?

Sir Herbert Lawrence: Yes.

1965. *Chairman*: That is what it comes to?

Sir Herbert Lawrence: Yes. You know, from the returns which we have handed to you, that a very large proportion of our business is armaments, pure and simple. There is a residuum. There is a percentage which varies to a considerable extent, but it would not support us in the present situation. We make no secret of it.

1966. *Sir Philip Gibbs*: You see, the argument put against you as an armament firm is that by your very efficiency as a business you create world danger. Would you admit that at all?

Sir Herbert Lawrence: I do not think I would be prepared to. I do not think that that argument can really be sustained.

1967. *Sir Philip Gibbs*: I should like just to quote to you a few words from a statement by Lord Wester Wemyss, who was, as you know, First Sea Lord

* See below, Q. 234.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

towards the end of the War. His argument really is rather powerful, and I think gives an answer to this point. He says:

"Apart from the moral objection to the present system, which is that warfare is a direct occasion for private gain, the system is attended by the inevitable consequence that the multiplication of armaments is stimulated artificially. Every firm engaged in the production of armaments and munitions of every kind naturally wants the highest possible output. Not only, therefore, has it a direct interest in the inflation of the Army and Navy Estimates and in world scares, but it is equally in its interests to push its foreign business. The more armaments are increased abroad, the more they must be increased at home."

Now, it is on the last sentence that I would rather like to ask you one or two questions; that is to say, that the more armaments are increased abroad, the more they must be increased at home; and I would immediately ask you a definite question about that anti-aircraft gun. You inveited that anti-aircraft gun and sold it to a foreign country, or to foreign countries. Does it not naturally follow, therefore, that the British Government must buy that new type of anti-aircraft gun in order to secure itself?

Sir Herbert Lawrence: I do not think it follows necessarily in this case, where the position was that the British Government were not unprovided with an anti-aircraft gun altogether.

1968. *Sir Philip Gibbs:* But supposing it is a better design of gun, does it not force it on the British Government to provide themselves with it, for the national security?

Sir Herbert Lawrence: It has not forced it upon them so far; but I do not think it necessarily follows—not necessarily.

1969. *Sir Philip Gibbs:* Supposing, for instance, that one of your subsidiary companies sells an improved type of machine gun, or any other armament, to a foreign country, does it not rather necessarily follow that another country, which may be in fear of the first, should therefore immediately order that type of weapon?

Sir Herbert Lawrence: I do not think it necessarily follows. You must remember that we cannot supply any country with anything without obtaining a licence. The Government know before we are permitted to do it, and therefore they have the opportunity, if they wish it, of either stopping it or using it themselves.

1970. *Sir Philip Gibbs:* I appreciate that, but I am really putting forward the argument that the very efficiency of your firm, and its enormous power and reputation, gradually raises the standard and the quantity of the arms in the world. Will you admit that?

Sir Herbert Lawrence: I should not have said the quantity. It might possibly raise the standard of arms.

1971. *Sir Philip Gibbs:* Does not that also include quantity?

Sir Herbert Lawrence: Not necessarily.

1972. *Sir Philip Gibbs:* Not necessarily; but the tendency would be to do so, would it not?

Sir Herbert Lawrence: I do not know. Suppose you came back simply to having pikes and swords, and then the special invention of sharpening were made, it would not extend the manufacture of them, necessarily. It would really depend more on political matters than on matters of that sort. It is not the efficiency of modern mechanism which makes it so much more in demand.

1973. *Sir Philip Gibbs:* But I think it is the efficiency of modern mechanism which forces a country which may be afraid of attack, or which desires to increase its defence, to invest in particular designs?

Sir Herbert Lawrence: Within certain limits, I suppose that might be a fair argument. It would be, in truth, an insufficient one.

1974. *Sir Philip Gibbs:* I am afraid some of my questions will be rather scattered and not on a general line of argument; but there was some mention of your having financial interest in Japanese firms which are making munitions of war, and so on. Would Vickers get further prosperity if there is an enlarged naval programme adopted by the Japanese Government.

Sir Herbert Lawrence: In so far as the firms in question are concerned, in that respect the only advantage to Vickers would be a possible dividend from their interest in that concern, which is not a big interest.

1975. *Sir Philip Gibbs:* But you would actually get some financial advantage from a very big naval policy in Japan?

Sir Herbert Lawrence: Certainly.

1976. *Sir Philip Gibbs:* You say in your statement regarding foreign trade: "It is unquestioned that all armaments"—all British armaments, you really mean—"and particularly ships of war constructed in this country, are in demand universally"; that is to say, you claim that the standard of British production is so high that when your firm produces something it leads really to a universal demand?

Sir Herbert Lawrence: Yes.

1977. *Sir Philip Gibbs:* That, you see, rather adds to the argument I am trying to follow, that increased efficiency of design also leads to an increase in the efficiency of slaughter between one nation and another.

Sir Herbert Lawrence: I think really the inference I meant to be drawn from it was more in this direction. Take, for instance, as world competition, the supply of ships of war for the Argentine for the purposes of argument. Our design and our work is so good that we stand very good chances of getting the contract, unless some other state is subvented by its own government. In fact, I think the work is so well known all over the world that people like to come here to get the work which is required; but that is all.

1978. *Sir Philip Gibbs:* Yes. You do rather admit in the last paragraph of Statement No. 2* that there is a possibility of abuse. You say that if armament exports are unchecked, the possibility of abuses will inevitably continue to cause anxiety and so perpetuate general disquietude.

Sir Charles Craven: That I think has not been read yet, Sir.

Sir Herbert Lawrence: That is *apropos* of the licensing system?

1979. *Sir Philip Gibbs:* Yes. May I ask you what kind of abuses you had in your mind, your own mind, when you wrote that paragraph?

Sir Herbert Lawrence: I simply say, in a previous part of that memorandum, that you will get all sorts of—

1980. *Chairman:* You are referring to the supply to irresponsible hodies, or irresponsible people?

Sir Herbert Lawrence: Yes.

1981. *Sir Philip Gibbs:* What kind of people did you have in mind when you wrote that paragraph?

Sir Herbert Lawrence: Well, all sorts of people who are quite immorally providing arms over a period to people like slave raiding countries, and countries of that kind. There has always been a great deal of criticism of what has been done in that way in the past, and I think that if you have a lot of small people whom you cannot control, that trade might spring up again. That is what I had in mind.

1982. *Sir Philip Gibbs:* You do not think it applies at all to Vickers?

Sir Herbert Lawrence: Impossible.

* See p. 371.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

1983. *Sir Philip Gibbs*: You do not think such places would enter into the public relationships of Vickers themselves?

Sir Herbert Lawrence: I think it would be quite impossible.

1984. *Sir Philip Gibbs*: Forgive me for pressing this point, but take for instance the Chaco war. The report by the League of Nations manifested the fact that this war between two very primitive peoples was becoming very highly mechanised and that they were being provided with all the most modern forms of destructive weapons, which came not only from America but from European countries. Would it be fair to ask you if your firm had contributed to those weapons?

Sir Herbert Lawrence: Oh, yes, we supplied them to Bolivia; but the contracts for most of that work were made a long time before the war. I can give you the whole details of the contracts.*

1985. *Sir Philip Gibbs*: I think, as a matter of fact, the delivery of goods increased actually during the process of the fighting?

Sir Herbert Lawrence: I do not think so, Sir. There was a certain amount of artillery provided. Some material was delivered during the war, but there were considerable delays because they would not take delivery of certain things, as not being sufficiently up to specification, and they had to be adjusted. The main contracts were some time antecedent to the war. I can give you the details of them.

1986. *Sir Philip Gibbs*: Thank you very much. Of course, that is to some extent an admission that a great firm like Vickers does supply these primitive peoples with very modern forms of slaughter? It provides them with a means of slaughtering each other?

Sir Herbert Lawrence: I do not think those people would admit that they are very primitive, really.

1987. *Sir Philip Gibbs*: Not the Bolivians and the Paraguayans?

Sir Herbert Lawrence: No. I had more in my mind a sort of slave trading business, that was conducted at one time, or the importation of arms into Arabia and Africa, which was pretty bad at one time, I imagine.

1988. *Sir Philip Gibbs*: Going to quite a different point, you added a supplementary statement with regard to Sir Basil Zaharoff, in which you said that he had had no kind of connection with the Vickers firms since 1924; but as a matter of fact in the American evidence before the Nye Committee, as it is called, there is the letter from Sir Basil Zaharoff dated in 1925. It is Exhibit No. 31, on page 336 of Part I of the Committee's Proceedings. The letter is dated the 19th May, 1925—that is, a year after the date upon which you mentioned his having ceased to be associated with the firm—and he says: "I deserve no thanks for what I have done, because I am bound to attend to the interests of my firm of Vickers and of my friends, the Electric Boat Company, in both of which I am a shareholder". Of course, that is going back some time in history, but you started your historical survey by going back as far as 1867, and therefore perhaps you will think I am justified in going back as far as 1925. In the popular imagination of the world there is no doubt that Sir Basil Zaharoff is regarded as a very sinister figure stalking through the Courts of Europe and acting as an agent for the sale of munitions of war. May I ask you what was his exact position with regard to the firm of Vickers?

Sir Herbert Lawrence: Prior to 1924?

1989. *Sir Philip Gibbs*: Prior to 1925. He was still acting in your interests in 1925?

Sir Herbert Lawrence: Only in regard to the Spanish business.

1990. *Sir Philip Gibbs*: Well, he uses the words, "my firm of Vickers."

Sir Herbert Lawrence: Have you ever met Sir Basil?

1991. *Sir Philip Gibbs*: Only just casually.

Sir Herbert Lawrence: He is rather an expansive person, and talks rather at large.

1992. *Sir Philip Gibbs*: Was he, as a matter of fact, at that time one of your agents?

Sir Herbert Lawrence: Yes, he was our agent.

1993. *Sir Philip Gibbs*: A specially appointed agent?

Sir Herbert Lawrence: Yes, for Spanish business.

1994. *Sir Philip Gibbs*: But previously to that, was not he also your general agent?

Sir Herbert Lawrence: I really do not know. He brought in a vast amount of business to Vickers, I know that, probably 20 years before that.

1995. *Sir Philip Gibbs*: But would he have been officially recognised as one of your agents? I mean, would he have signed an agreement with your firm? He must have done, of course?

Sir Herbert Lawrence: I do not think so. I should say certainly not. I do not think he was ever accredited in any sense by a signature of the firm.

1996. *Sir Philip Gibbs*: But in order to draw his commission, and so on, you would have had to have a formal agreement with him?

Sir Herbert Lawrence: I think he would have, probably. I have no knowledge of it.

1997. *Sir Philip Gibbs*: Would you like me to question Sir Charles Craven upon that matter?

Sir Herbert Lawrence: Certainly. There is an agreement now with him simply for Spanish business, and providing him with office staff, and a commission on that business; but nothing has happened to it for some time.

1998. *Sir Philip Gibbs*: Some question was raised with regard to your advertising in the Press, of which you will have the figures, but I want to ask you an additional question. Has Vickers any financial interest in any of the English newspapers?—

Sir Herbert Lawrence: Absolutely none, of any kind.

1999. *Sir Philip Gibbs*: You are quite sure of that?

Sir Herbert Lawrence: Except for the report of the annual general meeting, and that sort of thing.

2000. *Sir Philip Gibbs*: I do not mean that. Do you hold shares in any of the English newspapers?

Sir Herbert Lawrence: Absolutely nothing.

2001. *Sir Philip Gibbs*: It was suggested by one of the witnesses who came before us—he was by name of Pollitt—that Vickers had appointed a number of *The Times* correspondents as their agents abroad. Is there any truth in that?

Sir Herbert Lawrence: None. Those gentlemen whom he referred to—I have seen his statement—were employees of the people who represented us in certain capitals of Europe. We try to appoint people of considerable position and eminence in each place, and, failing that, we generally ask the local government if they can advise us as to somebody to appoint. Apart from that, their office arrangements are entirely their own.

2002. *Sir Philip Gibbs*: It is rather curious that correspondents of *The Times* should be selected. I take it that that is so. Is that so, Sir Herbert?

Sir Herbert Lawrence: Sir Charles will be dealing with that matter.

2003. *Sir Philip Gibbs*: Is it the fact that there were agents appointed who were also correspondents of *The Times*?

Mr. Yapp: There are two cases, as far as I know. One is the case of a Mr. Bryce, and one of Mr. Boncesco.

* See Appendix 15, p. 425.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

2004. *Sir Philip Gibbs*: And there was another gentleman too. There are three of them?

Mr. Yapp: As far as I know, Mr. Bryce was a correspondent of *The Times* newspaper before the fusion of Vickers and Armstrongs, but that had nothing to do with the appointment of agent.

2005. *Sir Philip Gibbs*: But it was done with your knowledge?

Sir Herbert Lawrence: What was done with our knowledge?

2006. *Sir Philip Gibbs*: The appointment of Mr. Bryce.

Sir Herbert Lawrence: To *The Times*, do you mean?

2007. *Sir Philip Gibbs*: No; the fact that he was a correspondent of *The Times* was known to you when he was made your agent?

Sir Herbert Lawrence: No, as far as I am aware it was not.

2008. *Sir Philip Gibbs*: Would it not have been necessary for you to have had his credentials?

Mr. Yapp: Mr. Bryce was a member of a company. It was the company which held the agency in Yugo-Slavia. Mr. Bryce was a member of that company, and Mr. Bryce personally was for a period a correspondent of *The Times*.

2009. *Professor Gutteridge*: Is he the gentleman, who utilised his typist to do all the work for *The Times*?

Sir Herbert Lawrence: Oh, no.

Professor Gutteridge: There was one of them who did, I believe.

2010. *Sir Philip Gibbs*: May I ask you whether the firm of Vickers made a loan at any time to Roumania for the purposes of buying munitions of war?

Sir Herbert Lawrence: Never. We have never made any loan to Roumania of any kind whatever, either direct or indirect.

2011. *Sir Philip Gibbs*: Because there is a statement in the *Manchester Guardian*—I am sorry I cannot give you the exact date—which states that a loan was made to Roumania, and the question was whether Vickers were repaid for the delivery of arms in Roumania, where English merchants had to cut a great amount of the moneys due to them, owing to the failure of the Roumanian Government.

Sir Herbert Lawrence: That story might have arisen from this fact, that the Roumanian Government after the War wanted to start the manufacture of arms themselves in government factories, and they asked us for our technical advice, and also for machinery. We sold them a considerable amount of machinery which was not required at our works, and at works which had been closed down here. They could not pay us, and we took shares in the company which they formed in place of it—in place of the money.

2012. *Professor Gutteridge*: That was the Copsa Mica?

Sir Herbert Lawrence: Yes.

2013. *Sir Philip Gibbs*: Thank you very much indeed. I think I will reserve my other questions for Sir Charles Craven, as they are rather more on matters of detail than of general policy.

2014. *Sir Thomas Allen*: In paragraph 2 of Statement No. 1* you say: "If the manufacture of arms is to be a function of the State, the State will have to keep large plants in being without having the advantage of supplying an export trade". We have been told in one connection that the export trade in arms is possibly the most lucrative part of the business. Why should the State in the event of national monopoly not have the advantage of this trade?

Sir Herbert Lawrence: I think that is more a political question than a commercial one. I do not

know if any state responsible for its own manufacture would also be prepared to manufacture for foreign countries. I should have doubted it. However, it is a matter of opinion.

2015. *Sir Thomas Allen*: But you would not preclude a state from doing a business which private enterprise now regards as legitimate and necessary to be done?

Sir Herbert Lawrence: Not necessarily, of course, but one would have thought, perhaps through experience, that it was inconceivable. I may be quite wrong. It is really an expression of opinion.

2016. *Sir Thomas Allen*: But there are many non-producing countries to which arms would be essential in any view?

Sir Herbert Lawrence: Certainly.

2017. *Sir Thomas Allen*: And there is no reason why a government producing nationally should not produce for those countries an essential commodity?

Sir Herbert Lawrence: Might I submit to you that that is the very argument that is being used by those who advocate peace at any price against the armament firms.

2018. *Sir Thomas Allen*: I know that that has been so, but while war organisation is essential to any nation there is no reason why, under a national system, a state should be precluded from doing what private enterprise does. That is my point.

Sir Herbert Lawrence: Certainly.

2019. *Sir Thomas Allen*: In the same paragraph of your statement you say: "In order to be in a position to pass rapidly from a peace-time to a war-time production, it will have to manufacture on a scale far higher than is normally required". If the state supplied all its requirements, it would naturally manufacture some at present and keep, I take it, plant accordingly. Why should the state monopoly affect the position any more than under the present system? You told us just now that you produce to order—that is, to the order of the state requirements.

Sir Herbert Lawrence: What I had in mind there was this. In the event of the state being the sole supplier of certain types of arms, they would have to keep a very considerable staff in existence and to employ them, and in order to employ them they would have to produce much larger quantities than a private firm has to do, because the private firm's business needs surplus employees either for foreign work or for commercial work.

2020. *Sir Thomas Allen*: In the same paragraph you say also: "After a prolonged peace, most of its production would be obsolete".

Sir Herbert Lawrence: Well, take matters like ammunition for field artillery, and a variety of stores that one can think of. That would have to be manufactured in excess of the actual consumption, year by year. You would be gradually accumulating vast quantities of stores which after a number of years would become completely obsolete.

2021. *Sir Thomas Allen*: Why so? Why would that be necessary?

Sir Herbert Lawrence: Do you mean necessary to accumulate?

2022. *Sir Thomas Allen*: Yes.

Sir Herbert Lawrence: Because you have got to keep the people employed. We employ our people because they are not only required actually for the armament work, but for a variety of similar commercial work.

2023. *Sir Thomas Allen*: Your point being that the Government would be obliged to manufacture above requirements, under a state system?

Sir Herbert Lawrence: Certainly.

2024. *Sir Thomas Allen*: It has been suggested to us that under a state system a reserve of plant to ensure the opening out of general possible requirements if war occurred, would obviate the necessity of accumulating stocks. You would simply have your plant ready.

* See p. 347.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Herbert Lawrence: For extensions?

2025. *Sir Thomas Allen:* Yes.

Sir Herbert Lawrence: There I have to be careful as to what I answer, because it is a matter on which I think, if you asked the Defence Forces, I mean the Army and Navy, what has occurred in industrial establishments, they would be able to tell you what has been done under that scheme, and I do not think I am at liberty to talk about it.

2026. *Sir Thomas Allen:* Do you think that in order not to necessitate the accumulation of stocks it would be practicable to have this plant ready and workable at a given time of emergency?

Sir Herbert Lawrence: Under a government control do you mean?

2027. *Sir Thomas Allen:* Yes.

Sir Herbert Lawrence: But you would not have the men. You might have the plant, but you would not have the men. The plant is expensive to keep up, but you might have the plant; but you might not have the men.

2028. *Sir Thomas Allen:* But all plant necessary for production has to be kept up somewhere at the present time. Is it your point that your plant can be taken over to some other productive purposes?

Sir Herbert Lawrence: Not the armament plant. The armament plant is kept in existence and going by simply (a) our supply to the Defence Forces here, and (b) our supply to foreign countries. The two combined keep our armament plant in fairly good condition.

2029. *Sir Thomas Allen:* But if there are no orders, the plant is idle, and that would apply to a state plant?

Sir Herbert Lawrence: Yes. For example as far as the steel plant is concerned, certain portions can be turned over to commercial steel for passenger ships.

2030. *Sir Thomas Allen:* In paragraph 3 of Statement No. 1 you say: "State manufacture is traditionally unenterprising and there will always be a tendency to be satisfied with conditions which may be expected to 'last my time'." Would you elaborate that point a little for us?

Sir Herbert Lawrence: I think there is no particular inducement. The arguments are common to all state enterprises, I think. It depends on whether you believe in a national system of administration of commercial businesses or not. I do not think that any of the great inventions of the last 100 years would ever have been heard of if you had had a purely national system or a system which depended purely on a democratic vote. Probably a democracy would have voted against any single one of the inventions which have improved life in the last 100 years.

2031. *Sir Thomas Allen:* Do you say that state monopoly would never pay as a business proposition?

Sir Herbert Lawrence: I think it is extraordinarily difficult to see how it is going to, personally. It might prosper in some countries, but not in a country like this, which has got to compete with world prices. I do not conceive it to be possible.

2032. *Sir Thomas Allen:* But it proved to be possible in war time. It has been advanced to us that in so far as the state is unenterprising, the main reason is the constant pressure of private manufacture on the three Services which otherwise would go to Government workshops, and that this has tended to reduce their efficiency, especially so since the War. Do you in any way bring pressure upon the Government for orders in order to keep your plant working?

Sir Herbert Lawrence: No, we have no power to bring any pressure.

2033. *Sir Thomas Allen:* Then you go on to say that under state manufacture there will always be a

tendency to be satisfied with conditions which may be expected to "last my time." Is not that in itself a reason why there is no enthusiasm for a change over from the present dual system to state responsibility, and really affords an argument against that system?

Sir Herbert Lawrence: Against private manufacture, or against state manufacture?

2034. *Sir Thomas Allen:* Against state manufacture.

Sir Herbert Lawrence: I think it is an argument.

2035. *Sir Thomas Allen:* Against state manufacture?

Sir Herbert Lawrence: Yes.

2036. *Sir Thomas Allen:* Your argument against state manufacture is contained in paragraph 3 of Statement No. 1 where you say: "In private manufacture there is the restless activity which derives from competition." You have already dealt with this competition point in answer to previous questions, but it does seem to us that this restless activity of private manufacture has been more in the direction of eliminating each other as manufacturers and therefore, naturally, the elimination of competition. In reply to a question put recently in the House of Commons the answer given was that there were fewer firms in existence for the purpose of manufacturing arms than in 1914. That is so, I take it, by reason of the amalgamations that have taken place?

Sir Herbert Lawrence: Yes.

2037. *Sir Thomas Allen:* Could you say there is any really effective competition in the armament trade at the present time?

Sir Herbert Lawrence: In this country?

2038. *Sir Thomas Allen:* Yes.

Sir Herbert Lawrence: No, I should say there is practically none.

2039. *Sir Thomas Allen:* Then in paragraph 3, coming to the point of the question which was raised by Sir Philip Gibbs, you say: "It was the genius of Sir A. Noble and his staff at Elswick which drove the Government to equip the Army with rifled ordnance and breach loading mechanism, after they had supplied numerous foreign countries." Is that a good reason really for supporting one enterprise, or for sustaining the element of competition, to supply countries abroad, and then make that a good reason for driving the Home Government to give orders for similar equipment?

Sir Herbert Lawrence: It would be surely natural that this country should not be worse equipped than other countries in respect of an invention of that kind. It would be like this country contentedly going to war with a muzzle-loading gun against a man who had a repeating rifle. It was the fact of Sir Arthur Noble's invention and that it was adopted by foreign countries, which did make this Government at last take up the question.

2040. *Professor Gutteridge:* I do not know if you can tell me, but I believe the first man who invented a breech-loading rifle was a German?

Sir Herbert Lawrence: Yes, I believe so.

2041. *Professor Gutteridge:* The breech-loading, I think, was not a British invention, was it?

Sir Herbert Lawrence: No.

2042. *Sir Thomas Allen:* Then there is a statement in the fourth paragraph, and does it not resolve itself into this, speaking of competition, that such competition as does exist between purchasers is really competition to create an atmosphere amongst governments to create demand?

Sir Herbert Lawrence: I think that must be a matter of opinion. I do not think so myself.

2043. *Sir Thomas Allen:* If this is a correct reading of it, is it not a very strong reason for abolishing the present system in respect of salesmanship?

Sir Herbert Lawrence: I do not know that that follows.

(Adjourned for a short time.)

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

On resuming:—

2044. *Sir Thomas Allen*: Still on Statement No. 1, paragraph 5, you say: "The Dockyards and Arsenals belonging to the State are no doubt very highly efficient, but in the event of war they could not do much more than keep abreast of repair work". I take it that adequacy in wartime depends really upon planning in peace time, and preparedness would apply equally to private manufacture as to the State, would it not?

Sir Herbert Lawrence: What I meant to imply there was that the existing factories which are under the control of the State could not do more than repair work in case of emergency, that their whole capacity would be occupied in repair work and not in fresh construction.

2045. *Sir Thomas Allen*: I take it that, in the event of the State deciding to nationalise, it would be upon an arranged plan, that they would be efficiently equipped for the work they would have to do in wartime.

Sir Herbert Lawrence: I presume so. Which would involve the taking over of our existing establishments, of course.

2046. *Sir Thomas Allen*: Yes, and providing other establishments. Following up the question put by Sir Kenneth before lunch: In paragraph 5 you say, "The State can, as long as private firms exist, fall back on them to supplement their normal production. The Government could do what was done in the last war with the railways—namely, take over the whole business as a going concern". I take it from your reply to Sir Kenneth that you raise no objection to a procedure of that kind. My point is this: If this is a good policy or a necessary policy in wartime, why not obviate the waste by not having to make it?

Sir Herbert Lawrence: By taking it over in peace-time?

2047. *Sir Thomas Allen*: Yes, that is the inference.

Sir Herbert Lawrence: The only objection to that—it is an objection from the State's point of view, not from my point of view—is the expense.

2048. *Sir Thomas Allen*: The expense?

Sir Herbert Lawrence: The cost.

2049. *Sir Thomas Allen*: We will, perhaps, come to that a little later on. In the sixth paragraph, you say "... when we, that is Vickers-Armstrongs, Limited, are considering the term 'armaments,' we do not think in terms of shells. . . . but we think in terms of the more advanced and complicated type of armaments." There are two things I would like to mention there. First of all, you did take orders for shells; we were told by Dr. Addison, I think, that Vickers and Armstrongs between them took orders for £1,927,000 worth of shells, that they delivered £543,000 worth, and that there were arrears of £1,384,000. While you were not thinking in terms of shells, you did take orders, and failed to deliver the goods. That is the first point. The second point is, that the tables submitted by Dr. Addison showed that the private firms generally, not only yours, were just as far behind in their promises of delivery in respect to machine guns and fuses as they were with respect to shells and cases. Is that correct?

Mr. Yapp: I am not sure that it is. I cannot answer definitely. I do not know that any definite promises about delivery of shells were made.

Sir Thomas Allen: Have you seen Dr. Addison's tables?

Mr. Yapp: I have seen Dr. Addison's statement. He does refer to definite promises having been made to deliver shells and certain other things in definite times. I am not quite sure that that is a correct statement.

2051. *Sir Thomas Allen*: You do not dispute it?

Mr. Yapp: I do not dispute it, but I think it is very much more likely that we were told that that was what they would like us to do and we said that we would do our best to do it. But you must

remember that we had so few orders for those shells before the War, and for machine guns, that we were not in production in any real sense of the word.

2052. *Chairman*: With reference to that point: We have been told that those orders, or the bulk of them, were given as a consequence of your people and some others who were present saying, "We cannot promise, but we will do our best." We have had that evidence, have we not?

Sir Thomas Allen: Yes. Only, that they did take the orders.

2053. *Chairman*: And Dr. Addison said they were written orders.

Mr. Yapp: Oh! yes, definite orders were received for the manufacture of shells.

2054. *Sir Thomas Allen*: In "B. VICKERS GROUP—BRIEF HISTORICAL SURVEY" you refer to the writing down of share capital. Was this attributable in any way to loss on armament production or to outlay in providing for or extending production in war-time emergency? I ask that for this reason. Sir Stanley von Donop, when he came before us, said that in October, 1914, a Committee of the Cabinet called upon the English armament firms to produce larger quantities than were already arranged, and that they were given a free hand as regards cash to set up plant and buildings. I was wondering whether you put that statement in as justification for any loss on armaments.

Sir Herbert Lawrence: No, it is not put in for that.

2055. *Sir Thomas Allen*: You do not attribute it to that at all?

Sir Herbert Lawrence: No. An allowance was made in the final adjustment of the accounts for excess profits duty.

2056. *Sir Thomas Allen*: I want to get it clear, because we have been assured again and again by various statements that have been made to us that every extension was paid for directly or in an agreed price for the munitions to cover any expenditure that might be necessary for undertaking this Government work.

Sir Herbert Lawrence: It was not done entirely in that way. When the final adjustment for E.P.D. was made that was taken into account. 2057. *Sir Thomas Allen*: In Statement No. 2, paragraph 5, you say: "An organisation such as that referred to above"—that is, Vickers—"is dependent upon the highest classes of engineering employment, both military and commercial." Is there anything peculiar to armament firms in this respect which is not common to other great firms not engaged in armament manufacture?

Sir Herbert Lawrence: Only in so far as nearly all military and naval production is a very high class of manufacture both in steel and in design. It is quite a speciality of its own.

2058. *Sir Thomas Allen*: In paragraph 6 you refer to facilities for design, etc. You say they "must all be available instantly, and capable of immediate practical development." Would you say that that is the state of your position now, in the event of an emergency, or was it the state?

Sir Herbert Lawrence: Yes.

2059. *Sir Thomas Allen*: I pass to the second paragraph under "Costs" in Statement No. 2. Another side of this picture was shown to us—I think by Dr. Addison—in this respect, that dependence by Government Departments on selected firms led to private inflation, and that knowledge of that dependence resulted in a fairly tight armaments ring and price understanding among the firms concerned. I think we have got that fairly well out in the morning discussion. You have nothing further to say upon that, I suppose?

Sir Herbert Lawrence: No.

* See p. 348.

† See p. 371.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

2060. *Sir Thomas Allen*: On the same page, under "Foreign Trade"—"the abolition of private manufacture would entail the loss to this country of an export of considerable importance with corresponding injurious effect on employment." We have been told that half the world's exports of munitions was made by Great Britain. Is that anything like the fact?

Sir Herbert Lawrence: Would you mind repeating that question?

2061. *Sir Thomas Allen*: We have been told that half the exports of armaments in the world is contributed by Great Britain. Do you know anything about that?

Sir Herbert Lawrence: I could not answer that question. I can tell you the proportion of foreign work which we do compared with our home work. We have given you that in one of the schedules which was asked for by the Commission.

2062. *Sir Thomas Allen*: You do not really know what the armament trade of the world is?

Sir Herbert Lawrence: No.

2063. *Sir Thomas Allen*: Is your point that the armaments trade is helpful and necessary to keep you in a competitive place in the markets of industrial and commercial production?

Sir Herbert Lawrence: Not so much commercial; but I would again refer you to that schedule. I am speaking from memory at the moment. You will see that during those five years the proportion of the foreign work which has been done by this firm is roughly about 30 per cent. of the whole that we have. That is a very considerable proportion. Of course that figure is largely made up of vessels of war of one kind and another—big and expensive things. The actual volume is not big; the cash representation of it is large.

2064. *Sir Thomas Allen*: I come to the point of redundant machinery which you would have in the event of a national monopoly. You say that machinery of the value of £22,300,000 would be rendered redundant in the event of a state monopoly. Is that the present value as shown in your balance sheet.

Sir Herbert Lawrence: It is the replacement value. It is the amount of money that you have to spend in order to create the machinery that is necessary, but it does not include goodwill, or anything else connected with the business at all.

2065. *Sir Thomas Allen*: Is that quite independent of writing down the £12,000,000?

Sir Herbert Lawrence: Quite!

2066. *Sir Thomas Allen*: Do you know what the total plant is in your balance sheet?

Sir Herbert Lawrence: It is such a tremendous group of companies that that would be very difficult to ascertain quickly.

2067. *Sir Thomas Allen*: My point is this: I have been totting up the figures of total production and, as far as I can make them, your turnover for 1934 for all purposes was £13,892,142, and on a succeeding page you show a specific production in armaments of £7,288,451 for the year, leaving commercial production at £6,603,691.

Sir Herbert Lawrence: Yes.

2068. *Sir Thomas Allen*: My point was this, that if we knew something of the balance sheet value of the total machinery it would help us with regard to the £22,000,000 figure.

Sir Herbert Lawrence: We will try and prepare something for you if you wish, but I think it would be very difficult to disintegrate. I can put it better in this way, that in certain factories—probably 100 per cent., or the vast majority, is purely armament work. In others—take Sheffield, which includes the English Steel Corporation—it is about 75-25, 75 commercial, 25 armament. And so it goes on through the various factories. At Barrow and Newcastle it is preponderantly armament; at Crayford and Dartford, it is almost entirely

armament. There is practically no commercial work there at all.

2069. *Sir Thomas Allen*: When you speak of replacement value are we to understand that depreciation has not been taken into account at all?

Sir Herbert Lawrence: Oh! it certainly has been taken into account.

2070. *Sir Thomas Allen*: Would it be too much to ask what is your rate of depreciation?

Sir Herbert Lawrence: It is what is allowed by the Inland Revenue for the purposes of ascertaining taxation, 7½ per cent.

Mr. Reid Young: 7½ per cent. on plant and 2½ per cent. on buildings, generally speaking.

Sir Herbert Lawrence: That is not the whole story. A great deal more is allowed than that.

2071. *Sir Thomas Allen*: More depreciation?

Sir Herbert Lawrence: We do not get relief from taxation in respect of it, but we allow more.

2072. *Sir Thomas Allen*: That is not my point. It does seem to me that if you depreciate at a rate of 7½ per cent. on a redundant value of £22,000,000 it is a very low rate of depreciation and would take longer to redeem in totality than by the ordinary business practice of wiping out machinery, say in ten years.

Mr. Reid Young: I think I might make it clear that the £22,000,000 figure bears no relation whatever to the book values of the plant. That £22,000,000 figure has been prepared by our engineers on the basis of putting in the place of the plant as it exists to-day a similar plant.

2073. *Sir Thomas Allen*: I did not ask you for the book values. What I asked you for was the balance sheet values.

Mr. Reid Young: The balance sheet values? It is the same thing.

2074. *Sir Thomas Allen*: The balance sheet values would bear no relation to the values of replacement?

Mr. Reid Young: No, none at all.

2075. *Sir Thomas Allen*: I come now to your Appendix 9.* On sales abroad, we have been told that the British Diplomatic Service has been used to secure orders. I think Mr. Newbold stated in his evidence (Questions 801 to 804) that firms are agents of the Foreign Office and are carrying out their policy as agents. Have you, in your own experience, any evidence of help or assistance having been given you by the Diplomatic Service in inducing other nations to give you orders?

Mr. Yapp: No.

2076. *Sir Thomas Allen*: I see that Sir John Simon, in answer to a Question in the House of Commons said practically that the United Kingdom Diplomatic Service assists British firms to obtain orders. You have not had that assistance at all in any way?

2077. *Chairman*: What we have been told hitherto is that where it has become common knowledge or has been advertised that foreign governments require certain—whatever it may be—then the representatives of this country in the particular place do their best to help them.

Mr. Yapp: Certainly they would; if we thought we were not getting fair treatment *vis-à-vis* our competitors we should certainly appeal to the Minister.

2078. *Chairman*: Then they do help?

Mr. Yapp: To that extent. That does not often happen.

2079. *Sir Thomas Allen*: The answer, I thought, indicated that assistance had never been sought.

Mr. Yapp: I would not say it had never been sought.

2080. *Sir Thomas Allen*: Are there any sales other than national undertaken by your firms abroad?

Sir Herbert Lawrence: To governments?

2081. *Sir Thomas Allen*: Yes.

* See p. 406.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

Mr. Yapp: No, except to foreign shipbuilders who may be building a hull for another country, and we may supply the armaments to them for ultimate delivery to another country.

2082. *Professor Gutteridge*: That would be within the knowledge of our government?

Mr. Yapp: That is all disclosed.

2083. *Sir Thomas Allen*: Coming back again to the totality of your production of armaments, I find an average sum of between £6,000,000 and £7,000,000 per year over the last five years. Would you not regard a £7,000,000 annual production of a commodity as good financial business to be undertaken by the state? Is it not big enough, or is it too big?

Sir Charles Craven: I do not know, Sir, that I can answer that question directly. That £7,000,000 may be £1,000,000 next year. If you had a guaranteed order for stuff every year for twenty years, yes; but you do not. What is going to happen to the state concern? I suppose I cannot ask you questions, but I draw your attention to the chart we put forward and the years following the War. A state factory would be shut.

2084. *Professor Gutteridge*: I think I am right in saying that in one year your armaments production was almost nil?

Sir Charles Craven: Yes.

2085. *Professor Gutteridge*: And I take it in that particular year you were supplanted by the state arsenal?

Sir Charles Craven: Yes.

2086. *Sir Thomas Allen*: It has been put to us that the cost of nationalisation would not really increase the cost of production to the government over the problematic period because the state already reimburse private firms for the whole of their charges incurred in maintaining private plant in the price paid for the commodity. Is there any truth in that at all?

Sir Herbert Lawrence: I say that is not true. It is definitely untrue.

2087. *Sir Thomas Allen*: My point is: If there is no truth in it at all—

Sir Herbert Lawrence: The state contracts are *ad hoc*, they do not bear reference to anything at all.

2088. *Chairman*: A suggestion has been made that the State is subsidising some firms now for maintaining their plant; but it does not apply to Vickers, I understand?

Sir Charles Craven: In one year, six years ago, a small subsidy was paid to the armour firms when no armour was ordered.

2089. *Chairman*: To your firm?

Sir Charles Craven: Yes, and the other two—to the three armour firms.

2090. *Professor Gutteridge*: How much was it, do you remember?

Sir Charles Craven: £60,000.

2091. *Chairman*: It was only done for one year in your case?

Sir Charles Craven: Yes: We have had nothing since then.

2092. *Sir Thomas Allen*: Under our present licensing system is it possible for component parts to be sent abroad for assembly to any firm with which you may have relationship?

Mr. Yapp: Is it possible, do you mean, within the limits of the licensing law?

Sir Thomas Allen: Yes.

Mr. Yapp: I should not think so.

2094. *Sir Thomas Allen*: Does the licence cover component parts?

Mr. Yapp: The licence covers components of all descriptions of armaments.

2095. *Professor Gutteridge*: What we were told by the Government Departments was that it covered component parts of everything except aeroplane engines.

Sir Herbert Lawrence: I think that is true.

2096. *Professor Gutteridge*: They said that aeroplane engines stood on a different footing, that nothing could leave an aeroplane factory without the Air

Ministry people knowing about it, because they had people on the spot, technical officers and inspectors.

Sir Herbert Lawrence: We do not make aeroplane engines.

2097. *Professor Gutteridge*: You only make the structure?

Sir Herbert Lawrence: Yes.

2098. *Sir Thomas Allen*: With regard to the convertibility of machinery, is it possible by any factor to convert any of this armament machinery to industrial purposes?

Sir Charles Craven: I think it is a very difficult question. There are certain machines that we should not have in our shops—machines, some of them, that cost £40,000—unless we were armament manufacturers. For a lot of their time they are used for machining large winders for the gold mines of South Africa.

2099. *Professor Gutteridge*: Have not some of them been used by Imperial Chemicals?

Sir Charles Craven: Yes, that is industrial.

2100. *Sir Thomas Allen*: I ask that question because it seems to me to be a rather important one from our national point of view. We have been told, for example, that in Germany all the new machinery that is being put down for industrial purposes is easily convertible for the purposes of munitions production. Do you know anything about that?

Sir Charles Craven: It is possible. I do not know.

2101. *Sir Thomas Allen*: Short of nationalisation, are you in favour of any system of control by the state that would help to minimise the objections alleged against private manufacture that have been put to us from time to time, and which you have no doubt read in the evidence that has come before us? Have you anything in your mind that, subject to the continuance of private manufacture, would give the public confidence and would remove any doubt with regard to the efficiency of our present system and prevent or minimise the alleged evils connected with the trade? It would help us to know if you are looking into the future and visualising the possibilities of what might be done. I do not know whether there is anything you can suggest to us, having in mind the continuance of private manufacture?

Sir Charles Craven: The only practical suggestion I have to make is that licences—

2102. *Sir Thomas Allen*: Before you answer: We have heard some evidence about a national central control board, to whom all the three Services would come, through whom all orders should be placed, and who should organise the industry in peace time, so that it would be prepared in the hour of emergency immediately to turn over to war-time production. Then we have had the American proposals placed before us with regard to licensing and other kinds of things. Are you familiar with that?

Sir Charles Craven: Yes, generally with the American proposals, but the only proposal that we would object to is international inspection. If it meant to say that international inspection was going to pry into every development we were trying to do, those inspecting government commissions would very soon be agents for firms in their countries.

2103. *Sir Thomas Allen*: Can you help us?

Sir Charles Craven: The only suggestion we have thought out is that licences should be licensed, that you should have to have a government licence to grant a licence to manufacture any of our products abroad. At the present moment every export is licensed, but the licensing is not licensed. I know of an instance where Mr. Yapp went to the Admiralty and got permission before we granted a licence to a foreign firm.

2104. *Professor Gutteridge*: You mean for certain of these components used for gun mountings on aeroplanes?

Sir Charles Craven: Take the anti-aircraft gun.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

2105. *Professor Gutteridge*: You licensed a foreign firm to make that gun?
Sir Charles Craven: Yes.
2106. *Professor Gutteridge*: And your point is that it might be advisable to get government authority before you grant the licence?
Sir Charles Craven: Yes.
2107. *Professor Gutteridge*: And that is not so now?
Sir Charles Craven: No.
2108. *Sir Thomas Allen*: Supposing the Government accepted all responsibility for receiving orders and sales generally, leaving private enterprise to manufacture, how would that work?
Sir Charles Craven: We should not get any orders. Government Departments move so slowly.
Sir Thomas Allen: That would mean state monopoly.
2109. *Professor Gutteridge*: Sir Herbert, may I ask you a question which springs from the last question? What, in your opinion, would be the effect on your business of a prohibition of export of arms to foreign countries? Would you still be able to carry on as an armament firm or not?
Sir Herbert Lawrence: I think undoubtedly it would hamper us to a very great extent. I think you have a return already before you which shows that that is something like 30 per cent. of our total production. Quite obviously, if you cut your production down by 30 per cent. it is a serious matter.
2110. *Professor Gutteridge*: Would it extinguish you as an armament-making concern? I am putting a purely hypothetical case. Supposing the Government said "We want you to make armaments for us but we do not want you to make armaments for the foreigner, therefore you must not export"?
Sir Herbert Lawrence: If the Government were to assure us a continuity of orders for a series of years—
Professor Gutteridge: I am assuming that.
Sir Herbert Lawrence: —it would replace others.
2111. *Professor Gutteridge*: May I put this to you: It has been suggested to us that it might be a desirable thing that publicity should be given to all orders placed with British armament firms for arms to be sent abroad. Would that publicity be injurious to your business, do you think?
Sir Herbert Lawrence: I think very few foreign orders would come to us under such terms and conditions.
2112. *Professor Gutteridge*: They would not care to place their orders if that were done?
Sir Herbert Lawrence: I think not. That must be a matter of opinion.
2113. *Professor Gutteridge*: What about publicity for licences? Would you object to that?
Sir Herbert Lawrence: You mean where the Government had given us a licence to export a, b or c?
Professor Gutteridge: Yes. Supposing they had given you a licence to export an anti-aircraft gun to Bolivia, for the sake of argument, would it harm you in any way if the details of that licence were to be made public?
Mr. Yapp: I do not think so.
2115. *Professor Gutteridge*: But the orderer, you think, would object?
Mr. Yapp: I think the customer would.
2116. *Professor Gutteridge*: That is what was in my mind—whether the foreigner would not object.
Sir Herbert Lawrence: I think he would.
2117. *Professor Gutteridge*: He can go to Germany or Switzerland and buy an Oerlikon gun where there would be no publicity.
Mr. Yapp: Yes.
2118. *Professor Gutteridge*: Let me take the anti-aircraft gun. There is a good deal of competition, is there not, in the anti-aircraft gun market, if there is a market for the anti-aircraft gun?
Sir Herbert Lawrence: Very large indeed!
2119. *Professor Gutteridge*: The Swiss make the gun?
Sir Herbert Lawrence: And the Swedes.
2120. *Professor Gutteridge*: The Abyssinians are using the Swiss gun?
Mr. Yapp: The Oerlikon gun.
2121. *Professor Gutteridge*: The Oerlikon gun. That is the one the Abyssinians are getting. And I suppose there is competition in warships?
Sir Charles Craven: Internationally?
2122. *Professor Gutteridge*: Yes. Is it keen?
Sir Charles Craven: Very!
2123. *Professor Gutteridge*: Now, Sir Herbert, if I may go on to another subject—do not answer this if you would rather not—am I right in thinking your view is this: That the problem of expansion in time of war is very largely one of man-power.
Sir Herbert Lawrence: Yes, undoubtedly.
2124. *Professor Gutteridge*: To turn to another matter: Do you subscribe to any of these so-called "patriotic societies"? I do not like the word "patriotic" society, but that is what they have been called—the Air League, the Navy League.
Sir Charles Craven: To the Air League we do; not to the Navy League.
- Sir Herbert Lawrence*: I know we do to the Air League.
2125. *Professor Gutteridge*: How much?
Mr. Reid Young: £250 a year, I think, speaking off-hand.
2126. *Professor Gutteridge*: That is a subsidy?
Mr. Reid Young: It is an annual subscription.
2127. *Professor Gutteridge*: What does an ordinary member pay to the Air League?
Mr. Reid Young: I think a guinea or two guineas a year. That is individual members.
2128. *Professor Gutteridge*: Is that the only amount you pay?
Mr. Reid Young: That is all.
2129. *Professor Gutteridge*: Do you assist in any other way?
Mr. Reid Young: In no other way at all.
2130. *Professor Gutteridge*: You do not subscribe to the Navy League, I think you said?
Sir Charles Craven: The Navy League would not accept a subscription from us. May I suggest you address the question to Sir Robert McLean, because he is chairman of the aviation company?
2131. *Professor Gutteridge*: I am reluctant to take up any more time than I can help. I happened to look at a book entitled *Merchants of Death* the other day and I see it is asserted there that Vickers is connected with a large number of firms none of which have been mentioned here—Brown Boveri, of Switzerland.
Sir Herbert Lawrence: The Italian company.
2132. *Professor Gutteridge*: Not the Swiss Company?
Sir Herbert Lawrence: No, not the Swiss Company.
2133. *Professor Gutteridge*: What is the Italian Brown Boveri? Is that an off-shoot of Vickers?
Sir Herbert Lawrence: No, it is an electrical company.
2134. *Professor Gutteridge*: Does it make armaments?
Sir Herbert Lawrence: No.
2135. *Professor Gutteridge*: Fokker Aviation?
Sir Herbert Lawrence: No.
2136. *Professor Gutteridge*: No interest. Pintsch, of Berlin?
Sir Herbert Lawrence: No.
2137. *Professor Gutteridge*: I have taken those names out of the book. I do not know anything about them. Nederland Engelsche Company?
Sir Charles Craven: Those are our Dutch agents.
2138. *Professor Gutteridge*: You have no shareholding in them?

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: They are just an agency firm.

2139. *Professor Gutteridge:* Then there is another company, which is described as Polonaise Materiel de Guerre. Do you know anything about that?

Mr. Yapp: No, we have no interest in that.
2140. *Professor Gutteridge:* So with the exception of the trifling interest in the Italian Brown Boveri you are not in any way connected with any of those companies?

2141. *Chairman:* Is not Brown Boveri mentioned in the papers you have given us?

Sir Herbert Lawrence: It is shown in the investments. Our policy has for a long time past been to get rid of those investments. They are of no value to us.

2142. *Professor Gutteridge:* You will correct me if I am wrong, but I understood you to say that you were compelled in some cases to take shares in settlement of bad debts.

Sir Herbert Lawrence: Yes.

2143. *Professor Gutteridge:* I do not want to travel over the same ground again, but I gather you say you have no arrangements of any kind for the sale of armaments as regards Schneider or Skoda.

Sir Herbert Lawrence: Other than I have mentioned to you.

2144. *Professor Gutteridge:* Skoda?

Sir Herbert Lawrence: No, none.

2145. *Professor Gutteridge:* Nor with any of the German manufacturers?

Sir Herbert Lawrence: No.

2146. *Professor Gutteridge:* And that applies not merely to military armaments but to naval armaments and aircraft?

Sir Herbert Lawrence: No agreement of any kind.

2147. *Professor Gutteridge:* There are two other questions that I think I ought to put to you, as I think you are the responsible financial head of the firm. May I ask you this: It has been suggested to us—I do not quite follow it myself—that in some way or other where you have a factory which produces both armaments and commercial products the administrative expenses may in some ways be increased. Do you agree to that?

Sir Herbert Lawrence: No, I do not think so at all. I should think it is not true.

2148. *Professor Gutteridge:* I cannot quite follow the reasoning but I imagine the objection is that in some way you get double administrative expenses.

Sir Herbert Lawrence: No. In ascertaining the price to be charged for work for the Admiralty, for instance, the whole question of management charges is brought out; a certain percentage is allowed for the commercial side, a certain percentage is allowed for the armament side, and that is agreed by the authorities. There is no duplication. Those figures are disclosed to the Government.

2149. *Professor Gutteridge:* And in effect it does not cost the Government any more, you say?

Sir Charles Craven: No.

Sir Herbert Lawrence: Really it costs less, because the Government get the benefit of a certain amount of charge on the commercial side.

2150. *Professor Gutteridge:* I follow that. There is another point that perhaps might be put to you. It has also been suggested that in some cases armament firms like yours are linked with other firms producing raw materials and half finished products and that you disguise the profit made by the ultimate manufacture of Vickers by putting part of it on to the partly finished goods and the raw material which is the product of your associated companies. Is that so? "Cutting up the melon" I think it is called commercially, is it not?

Sir Herbert Lawrence: We do not make the raw material or the semi-manufactured raw material.

2151. *Professor Gutteridge:* The English Steel Corporation do, do they not? You see the idea—the

English Steel Corporation take this bit and then they pass it on to—

Sir Herbert Lawrence: Barrow or Elswick.

2152. *Professor Gutteridge:* . . . and you put so much per cent. on each time it moves, and you disguise the profit.

Sir Herbert Lawrence: There is no hidden profit. It is very strictly regulated, the price that one factory charges to another.

2153. *Professor Gutteridge:* Supposing you did that, would it be possible for the government investigator to discover it when the price-fixing takes place?

Sir Herbert Lawrence: Absolutely!

2154. *Sir Philip Gibbs:* I do not want to ask you any more questions, Sir Herbert, but I want to call your attention to what I think is a rather unfortunate phrase that you used in the first few lines of your statement this morning, in which you referred to "an honourable but perhaps mistaken ideal respecting the sanctity of human life and the iniquity of war." I want to suggest that that is an unfortunate phrase, which rather lays you open to criticism by your pacifist friends.

Sir Herbert Lawrence: I am quite prepared to admit, Sir Philip, that it is rather rhetorical.

2155. *Sir Philip Gibbs:* Do you not think it is rather unfortunate?

Sir Herbert Lawrence: I would not like to say that, because—you are cross-examining me on the point—I think the question of the sanctity of human life, which is one which appeals to every human being, every civilised human being, has sometimes been exaggerated, altogether to the disadvantage of certain other features of public life, and I think it is a pity it has been exaggerated in that sort of way.

2156. *Sir Philip Gibbs:* Do you think you can exaggerate the iniquity of war?

Sir Herbert Lawrence: I think you can, yes. I would take it to this point: There are certain people, for whom I have very great personal respect, who under no circumstances whatever would go to war or defend themselves. That is a very high ideal. It is not one with which I am in sympathy. I think it is a wrong appreciation of the existing conditions of life. Mr. Lansbury, for whom I have great respect, practises his ideal. I respect him for it; but I do not agree with it. I think he is wrong. That is all that I convey there. Not that I do not appreciate the value of human life. It is not that.
2157. *Sir Philip Gibbs:* It seems to me it lays you open to the criticism that you are under-estimating the iniquity of war, and it seems to me inconsistent with your statement at your last general meeting, when you said "Both the directors and the shareholders know to their cost the sorrow and suffering which war entails, the wastage of human life and material, the final loss which posterity has to bear, and the damage which is done to the economic structure of the world." You do not think there is any inconsistency between those two statements?

Sir Herbert Lawrence: No, frankly, I do not. I endorse every word I have put down. I do not think it is inconsistent.

2158. *Chairman:* I have one or two supplementary questions, please. The first is this: I ought to have asked it before. You are in favour of the licence system?

Sir Herbert Lawrence: Yes.

2159. *Chairman:* It has been suggested to us that it would be an improvement of the licence system if the orders when they were received by a firm should be licensed, that the firm should obtain a licence for the orders before they proceeded with the work, that it ought to be necessary to have the order licensed and not merely a licence to export. Do you see

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

any business objection to that? I suppose in the majority of cases people ask beforehand whether they are likely to get a licence.

Sir Herbert Lawrence: What happens is this. Somebody offers us an order, or we apply for an order. If the order is given to us, before we begin the work, or accept it, we put it before the Board of Trade officials concerned.

2160. *Chairman:* Then it is only a matter of book-keeping to go a little further and say "You must have a licence". You quite agree to that?

Sir Herbert Lawrence: Yes.

2161. *Chairman:* The other question is about publicity. Considerable importance is attached apparently to publicity and that both the licence for the order and the licence for the export should be published, and the Professor put to you the question: What effect would publicity have upon your business? I would ask you to consider this other possible effect. One of the objections to the private manufacture and export trade in arms is that it is suggested there is a great deal of touting goes on and that an agent goes to Country A and says "Country B have given an order for an improved gun and you will find yourself in difficulty if you do not give me an order for a similar kind of gun" and that in that way the quantity of such armaments and arms is increased. Now I want to know what your view would be about publicity. Supposing there is to be publicity of these armaments, would not the effect upon various countries be exactly the same as if the tout had gone to them and said "So-and-so country has given an order", because it would be common property, and instead of one country ordering an improved gun perhaps half a dozen countries might do so? It seems to me the cure may be worse than the disease, if you have publicity.

Sir Herbert Lawrence: I think it is conceivable. It is very difficult to say what is the psychological effect of these movements. I think it might well be what you say.

2162. *Chairman:* From a business point of view I would like to know first of all what is your view. If that is likely to be the effect, it seems to me that you are creating another way of doing the very thing that people are complaining about.

I am requested to ask these questions: There are two to you, Sir Herbert, and one to Mr. Dunbar. The first is this: "Has Vickers Limited or its subsidiary companies any shareholding or interest in the Vickers Terni Company of Italy?" Have you any interest in the Terni Company, or is there a separate company.

Sir Herbert Lawrence: Not now; no, the Terni shares have all been sold.

2163. *Chairman:* When were they sold?

Sir Herbert Lawrence: We have been trying to sell them for a couple of years past. Nearly two years ago.

2164. *Chairman:* "If not, had Vickers any shareholding or any interest in this company in the past, and when did this interest and/or shareholding cease?"

Sir Herbert Lawrence: That was two or three years ago.

2165. *Chairman:* Had you a large interest in it? Is the company still in existence?

Mr. Reid Young: Not as Vickers Terni.

2166. *Chairman:* Is it under a different name?

Sir Charles Craven: Terni is the company to-day.

2167. *Professor Gutteridge:* It is something to do with the Orlando?

Mr. Yapp: It is a combination of the Italian shipyards and Terni.

2168. *Professor Gutteridge:* Orlando were competitors of yours?

Mr. Yapp: Yes.

2169. *Professor Gutteridge:* Armstrong-Pozzuoli went out years ago?

Mr. Reid Young: We held at one time shares to the nominal value of 4,200,000 lira out of an issued capital of 15,000,000 of the Vickers-Terni Company.

2170. *Chairman:* That has all been disposed of?

Mr. Reid Young: That has all been disposed of.

2171. *Chairman:* And your name no longer appears in connection with this company?

Mr. Reid Young: No.

2172. *Chairman:* You have never controlled that company, I take it?

Mr. Reid Young: No.

2173. *Chairman:* The other question is this: "Was there a provision in the former articles of association of Vickers, Limited, or a resolution of the company or of the board under which a percentage of the profits were to be distributed among the directors or certain of them?" I did not frame this question.

Sir Herbert Lawrence: In the old company, before the reconstruction in 1926, I believe there was something in the articles of association which permitted some percentage of profit to go to the managing directors.

2174. *Chairman:* That was in the old company?

Sir Herbert Lawrence: That was in the old company.

2175. *Chairman:* And before the amalgamation?

Sir Herbert Lawrence: Before the amalgamation.

2176. *Chairman:* "During the late War were certain sums paid under this provision to Sir Basil Zaharoff, and to some of the directors of Vickers, Limited? If so, how much, and to which directors were these payments made?"

Sir Herbert Lawrence: I have absolutely no record of anything of that kind at all. I do not know anything about it, Sir John.

2177. *Chairman:* That disposes of that. Now I ask this question of Mr. Dunbar: "Does Mr. Dunbar dispute the evidence tendered to the Royal Commission by the Union of Democratic Control (Days 7 and 8, pp. 197-198) with regard to the holdings of Vickers-Armstrongs and the English Steel Corporation in the Steel Manufacturers Nickel Syndicate?"

Mr. Dunbar: Not with regard to the holdings—certainly not, Sir. I think it would be well if you would allow me to say a word about the Nickel Syndicate.

2178. *Chairman:* Yes.

Mr. Dunbar: I would, first of all, like to emphasise that the Nickel Syndicate is by no means an international armaments ring, still less is it a sinister international armaments ring. It exists purely for the benefit to be derived from collective buying of nickel. It was formed 35 years ago, and was probably very wisely formed at that time, in view of the fact that there was only one source of supply of nickel and that was in French hands. An agreement was made with the French suppliers which assured supplies of nickel at reasonable prices and preferential treatment. In effect that state of affairs has existed ever since. In the evidence which was given by the Union of Democratic Control there was an inference, I take it, that some dark secret lay behind the acquisition of the former German shares. The Germans and the Austrians were shareholders and their shares during the late War were vested in the Public Trustee. The shares were £1 shares, 10s. paid, and were subsequently purchased by the Syndicate from the Public Trustee. They belong to the Syndicate as a whole. We still buy our steel under an agreement with the French company, Le Nickel. Le Nickel is now very closely linked up with the International Nickel Company—how closely and what their arrangements are we do not know, and it is not our business to know. We buy under a contract with the French company; but practically the whole of our supplies are of Canadian nickels refined in this country. During the last three years, speaking for my own company, less than one per cent. has been continental.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

2179. *Chairman*: Do you buy from the Syndicate?

Mr. Dunbar: The Syndicate does not actually buy. The Syndicate is simply a collection of firms who benefit from this joint agreement whereby they restrict their purchases to one source. It is no hardship because there is only one source of supply. In return they get a sliding scale rebate based on the total purchases of the whole group. Thus each individual firm qualifies for a higher rate of rebate than would be possible by buying individually.

2180. *Chairman*: What fixes the market price?

Mr. Dunbar: The market price is fixed by the suppliers, who are the International Nickel Company. The market price in this country is £200 a ton—everyone knows that—but the members of the Syndicate get a rebate on a sliding scale. The suggestion was made that that rebate was concealed from the Government. That is not so; that is incorrect. As a matter of bookkeeping, the rebate is treated as a direct credit to Profit and Loss. That is, I think, reasonable and accurate; because you will understand that until the end of the year the rate of rebate is not definitely known, but in any discussions that we have had with the Government Departments, it has been assumed that the full rate of rebate would be earned and the net price of the nickel has been included in our costing returns or estimate of the costs.

2181. *Chairman*: Thank you. There is another branch of the same question. "Is it one of the principal objects of the Steel Manufacturers Nickel Syndicate to supply to the shareholders of the company certain non-ferrous metals, raw materials essential for armament and other high grade steels?"

Mr. Dunbar: The answer is no.

2182. *Chairman*: The third branch is "Has the Steel Manufacturers Nickel Syndicate been supplying or financing the purchase of these raw materials or acting as the agent for the Italian Terni Company (a shareholder in the Steel Manufacturers Nickel Syndicate) during the present Italo-Abyssinian dispute?"

Mr. Dunbar: No. The Syndicate is not even in touch with Terni at the moment. Terni orders direct from Le Nickel in Paris, but for purposes of record they advise the Syndicate of what they are ordering. Since the present dispute started, I think I am correct in saying that they have not even advised them.

2183. *Professor Gutteridge*: Might I ask Sir Herbert a very short question that I omitted to put before? It has been suggested to me that it might be a desirable thing that British companies carrying on armaments business should include a clause in their articles of association limiting the holding of shares to British subjects. Do you think there is any point in that?

Sir Herbert Lawrence: That is a question which has been raised in the last 10 years in regard to certain definite companies.

2184. *Professor Gutteridge*: Yes.

Sir Herbert Lawrence: And arrangements were made by which foreign shareholdings should be taken over by a group. I think the danger of foreign shareholdings is exaggerated. I was a member of a small committee which attended upon the Treasury and the Governor of the Bank of England in regard to this very point, and my recollection is that we came to the conclusion that it might be desirable, but in the present situation there was no particular fear of this being a serious matter.

2185. *Dame Rachel Crowdy*: May I ask a question on this point—unless Sir Herbert feels that it should be asked later. I wanted very much to hear something about your sales organisation. Could you tell me anything about that, distinguishing between subsidiary companies, selling agencies and what are ordinarily called commercial travellers? Obviously, they fall into three sections. At the same time, could you give us roughly a list of the places where you

have permanent selling agencies and, again roughly, the number of commercial travellers or the number of agents that you have in your employ at the moment?

Sir Herbert Lawrence: You shall certainly have the information; Madam, but I would like you, if you will, to allow Mr. Yapp to reply. He is the head of the organisation which deals with the appointment and organisation of those gentlemen.

Mr. Yapp: I think, as a matter of fact, you have already some information with regard to our foreign agencies.

2186. *Dame Rachel Crowdy*: We have some information, but it is not a complete answer to this question, so if you would be good enough to answer it as far as you can at the moment, I should be very grateful, if you have these figures in your head.

Mr. Yapp: In most countries we have permanent agents. You are speaking of armaments and not of commercial products?

2187. *Dame Rachel Crowdy*: Yes.

Mr. Yapp: We have not any "commercial travellers" for armaments. We have a staff of officials in London who are partly technical, partly commercial, who go abroad in connection with definite armaments inquiries as required. Otherwise we have permanent agents in practically every country in the world.

2188. *Dame Rachel Crowdy*: As a person who travels a good deal, I come across your agents frequently—in the Far East, in Turkey, or wherever I may be—and that is why I am particularly interested in the subject because I have talked informally to them from time to time, and I wondered if you could give this Commission a general idea of the total strength of your permanent agents abroad.

Mr. Yapp: I can quite easily give you the number of our permanent agents abroad. They are set out in a book which the secretary has. As far as our staff in London is concerned, it consists of about six men.

2189. *Dame Rachel Crowdy*: I am more interested in your staff abroad than in your staff at home.

Mr. Yapp: I can give you those particulars immediately.*

Sir Herbert Lawrence: What happens is this. Supposing we are likely to get an order from Turkey or wherever it may be, one of our officers working under Mr. Yapp goes out from here and explains it technically to the agents.

2190. *Dame Rachel Crowdy*: One of your five or six men?

Mr. Yapp: Yes.

2191. *Dame Rachel Crowdy*: How do you remunerate your agents? Is it entirely by salary, or is it by salary and commission?

Mr. Yapp: It is by commission. Most of these questions are dealt with in our reply to your questionnaire.

Chairman: We have the form of agreement.

2192. *Dame Rachel Crowdy*: We have not the whole of the detail, Mr. Chairman. If it is by commission, what is the proportion of the commission expenses and what goes into the pocket of the man who gets your order for you? I am interested in the business as a whole, as compared with other businesses. Have you any definite proportion, or does it alter?

Mr. Yapp: No, we pay our agents a percentage of commission.

2193. *Dame Rachel Crowdy*: A percentage?

Mr. Yapp: Yes. But as to what part of that goes into his own pocket, or what he does with it, we have no control.

2194. *Dame Rachel Crowdy*: You pay their expenses in addition to the commission?

Mr. Yapp: No. In a few cases we do make an office allowance of £500 a year to our agents—I think that is the most we pay to any agent—to cover part of the expenses of his office, but beyond

* See Appendix 17, p. 430.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

that he gets nothing but the commission on an order.

2195. *Dame Rachel Crowdy*: Therefore any entertainment has to come out of his commission, really?

Sir Charles Craven: Yes.

2196. *Dame Rachel Crowdy*: And any "palm-greasing" has to come out of his commission?

Sir Charles Craven: Certainly.

2197. *Dame Rachel Crowdy*: Then again when your agents have to—I use the words "palm-greasing" because I can think of no other at the moment—when your agents have to resort to what is sometimes called bribery, handing a certain amount of money to a person in an official position in a country in order to get a contract—and one knows that is done very largely in South and Central America—how do your people distinguish between a bribe paid in the ordinary way, and a bribe which would induce the government to place an order which would not otherwise be placed with anybody? You pay your agents, and it is a very clear distinction, is it not?

Mr. Yapp: I really could not distinguish as to how they do it. I do not think our agent makes them a payment to induce them to buy something which they would not otherwise buy.

2198. *Dame Rachel Crowdy*: It would be a very unusual business, would it not, in certain countries, if money of that kind did not pass in order to get a contract? In every business which one knows anything of in certain countries one has to do that to get orders. I cannot think that arms are distinct in that practice.

Mr. Yapp: No, I do not think that arms are distinct from any other trade; but I have no knowledge of our agents having paid anything to any government—

2199. *Dame Rachel Crowdy*: Government officials; it is not quite the same as the government.

Mr. Yapp: —to government officials or anybody else, to purchase arms which otherwise they would have had no intention of purchasing.

2200. *Dame Rachel Crowdy*: But if it was a case of obtaining an order for your firm which might otherwise go to some other firm?

Mr. Yapp: Yes, I quite appreciate that.

2201. *Dame Rachel Crowdy*: In a case like that, how do you enter a sum of that kind in your financial returns? Does it come under charity, entertainment, or what does it come under?

Mr. Yapp: The agent has to do that. It is not a matter which enters into our calculations.

2202. *Chairman*: It comes out of their commission?

Mr. Yapp: Yes, it does not enter into our calculations at all.

2203. *Dame Rachel Crowdy*: They would find it difficult to pay out of their £500?

Mr. Yapp: That is only office expenses. Our average rate of commission, which we shall come to when dealing with the question later on, paid to our armament agents abroad for the last five years is 3.4 per cent. That is in a matter of fourteen foreign countries from whom we have received orders, the average rate of commission is 3.4 per cent.

2204. *Mr. Spender*: You say you do not solicit orders, and yet you pay your people only by commission. How can they earn commission unless they solicit orders?

Mr. Yapp: Well, orders are placed without any solicitation. If a government decides to buy ships for which orders are eventually placed, our agents try to get them, naturally.

2205. *Dame Rachel Crowdy*: Do you say no effort is ever made to make a country take war materials or aircraft that it would not take without a little giving from your agents or your representatives?

Mr. Yapp: I do not think so.

2206. *Dame Rachel Crowdy*: I am thinking for a moment of something which we had quoted from Sir Charles Craven: "I am trying to ginger up Chile."

Sir Charles Craven: Might I answer that question?

2207. *Dame Rachel Crowdy*: Yes, please do.

Sir Charles Craven: The Chileans had a naval programme consisting of six submarines. We delivered three of them, but the others have not been delivered because the Chileans could not afford to pay us what they owed us. That was the "ginger."

2208. *Chairman*: I think I am right in saying that we have had no evidence of any bribery to induce a government to give an order which it would not otherwise have given. I do not think we have had any direct evidence of it, but when an order is advertised and there are a number of firms competing for it, it does no doubt come out of his commission when the agent pays certain expenses.

Mr. Yapp: I do not think there is any question about that. I do not deny that for a moment.

2209. *Dame Rachel Crowdy*: Before lunch I asked a question, and I am afraid I put it rather badly, about what sum of money your firm spends on advertising, and Mr. Twentymann pointed out to me afterwards that you had given some figures which I had not noticed in my reading of your statements.

Sir Herbert Lawrence: Yes.

2210. *Dame Rachel Crowdy*: There were advertisements in 1932 of, I think, a tank and a machine-gun, and something else of that kind, advertisements which you inserted in a German paper?

Sir Herbert Lawrence: Yes.

2211. *Dame Rachel Crowdy*: At the time, as far as I know, the supply to Germany of arms was not allowed. I should like very much to get your explanation of that, because it is an accusation that has been made against you several times by various people who have given evidence here, that at a time when arms were not officially allowed to be given to Germany under the Treaty of Versailles, Vickers were advertising in that country that arms could be supplied. You yourself probably would be glad of an opportunity of replying to those accusations.

Sir Herbert Lawrence: I should like to answer that, because I was asked the question before. I regret that the advertisement ever was published in a German newspaper, but the reason for it was that the newspaper in question was the only one with a circulation in South America, where we were very anxious to establish contacts; and it also had a circulation in Northern European countries. But it had no reference to supplying Germany with arms themselves.

2212. *Dame Rachel Crowdy*: And no demand came from Germany?

Sir Herbert Lawrence: No.

2213. *Dame Rachel Crowdy*: And none was fulfilled?

Sir Herbert Lawrence: That is so. I may say that the advertisement was stopped at once. I saw the objection to it at once.

2214. *Dame Rachel Crowdy*: I am afraid I have still some questions, Sir John; I am sorry. They are not necessarily to Sir Herbert. If Sir Herbert wants to leave, I shall be perfectly satisfied to ask them of any member of his staff.

2215. *Chairman*: Sir Herbert, is it convenient for you to stay?

Sir Herbert Lawrence: Yes. For the moment I prefer to stay.

2216. *Chairman*: We have got now to go back to the statement. You are going to deal first of all with Statement No. 2, I think. I did ask some questions about it. You wish that read, I suppose?

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: No, Sir. I do not know whether you wish it read. It will be published, will it not?
2217. Chairman: It becomes part of the record, and it has been supplied to everybody, so that unless you wish it read I do not think it is necessary.
Sir Charles Craven: I do not think so.

The following statement was taken as read:

STATEMENT No. 2

STATEMENT OF THE POSITION OF VICKERS-ARMSTRONGS, LIMITED, AS AN ARMAMENT MANUFACTURING FIRM.

The Group of Vickers-Armstrongs' Companies comprises several branches of activity, the main branch being armaments, especially of the heavy and highly specialised types. Among these are included heavy and light guns, transferable and non-transferable gun mountings, armour plate and bullet proof plate, fire control gear, torpedoes and torpedo tubes, ammunition, etc. The Vickers-Armstrongs Company is also the largest builder in the country of warships of all types, including their propelling machinery, and, in fact, is the only British Company capable of building a complete warship with its armour and armament.

In addition, the Group have a large commercial engineering business, including among its activities merchant shipbuilding (particularly high-class passenger shipbuilding), a highly developed steel industry producing especially the highest quality of alloy steels, the heaviest types of forgings, and drop-stampings as required by the aviation and motor-car industries. The Company also has a considerable capacity for the production of non-ferrous metals.

In the course of the ordinary fluctuations of business each of these industries may vary enormously in the receipt of orders. It is therefore an administration problem of great importance so to arrange a balance of work in order that overhead charges may be rigidly controlled and what is of even greater importance, that labour dislocation shall be reduced to a minimum, however the activity of the various manufactures of the firm fluctuate.

It must be remembered that the whole of this work, thus intimately interconnected, is of a very highly specialised character and demands specialised and highly trained labour. It is, for example, imperative that facilities for the training and experience of apprentices in the most accurate forms of engineering shall be provided in a steady stream, and this obviously can only be done if work is varied and well maintained.

An organisation such as that referred to above is dependent upon the highest classes of engineering employment, both military and commercial. If such an organisation were confined solely to the construction of armaments, there would be times when it would be necessary to close down due to lack of work. Reference to the chart* will show the situation which would have arisen at the Barrow Works of Vickers-Armstrongs (the largest works in the Group) if no commercial work had been available to meet the practical cessation of armament orders in the years following the War. Such a situation would disperse a highly technical organisation which it would be impossible to reassemble within a reasonable time, even if any form of skeleton nucleus, however highly trained, were retained.

War Time.—By War-time expansion is meant *very rapid expansion*; immediate repetition in large quantities of highly complex engineering structures. In the nature of things there is very little opportunity for preliminary preparation. Facilities for design, method of manufacture, technique, routine, procedure, must all be available instantly and capable of immediate practical development. It may be necessary to add structurally to an establishment, to provide for increased output, but the important point to notice is that in a Group such as Vickers-Armstrongs, by the very nature of the normal character of its activities the technical staff, trained work-

people, and equipment are to the greatest possible extent already available. Not only this, but existing complementary engineering and technical activities may be immediately modified to urgent and specialised requirements without involving new organisation.

The only nucleus which could have any value in such an emergency as war, or a crisis in national defence, is one of such magnitude as to ensure a smooth working organisation complete in every detail and practised in appropriate manufacturing processes. In other words, it requires trained and specialised personnel, in ordinary employment, where expansion would merely be a question of numerical addition to an existing structure. In this respect, it is important to realise that in a national emergency the private armament firms inevitably bear the brunt of immediate urgent demands. They are, as it were, the spearhead of the war-time production. It is impossible to assign too much importance to the question of war-time expansion. It is unquestionably the keynote of national defence.

In considering war-time expansion it should, of course, be understood that the Armaments products referred to above do not include the manufacture of Shell, other than Armour Piercing Shell. The manufacture of High Explosive, Common and Shrapnel Shell is only undertaken by the Company in peace time in order to ensure single responsibility for the supply of complete equipments, and for this reason Shell Shops of small dimensions are maintained.

It is considered that the mass supply of ordinary Shell in an emergency is not essentially within the scope of the expert Armament firms and provided that the design is correct and inspection is rigid, such Shell can be produced in any ordinary Engineering establishment with unskilled labour. It may perhaps be considered desirable that the Armament firms should equip a Shell Shop in the event of an emergency arising, but the only reasonable excuse for their doing so would be in order to absorb female labour in an outlying district where there were no other facilities for their employment.

Labour.—Vickers-Armstrongs and their Subsidiaries alone employ to-day approximately 30,000 people. This number is divided between a few important centres of which Barrow is the largest from an employment point of view. Barrow is an example of an organisation consisting of an Armament and Engineering Works and a Shipbuilding Yard. Such a comprehensive focus of industry is the centre of employment and activity for the whole surrounding area of several square miles. Apprentices are recruited largely from the sons of the workpeople and the organisation is such that promotion by merit is the central feature. Thus every stimulus is offered to the Staff to observe the most intense personal interest in the efficiency of the Works. The holders of the highest managerial posts are often recruited from the ranks of those who have been apprentices and so have lifelong experience and interest in the activities of the firm. Technical educational facilities are available for those who show marked ability.

It is obvious that a large works, dealing as its normal practice with an extremely accurate and specialised form of engineering, employs specialists in great variety, and as outstanding engineering specialisation is to be attained only by incessant

* See p. 373.

8 January, 1933.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

practice and variety of experience, it is essential that work, having these characteristics, should be constantly provided. Experience in armament work by no means produces the arms specialist in any narrow sense, but obviously experience gained in that, the most exacting form of engineering, evolves the very best engineer and operative for passenger shipbuilding and high-class commercial engineering work. It is very largely because of this special training and experience of the Staff, that Vickers' products have acquired their high reputation throughout the world.

Such an organisation of employment as that outlined above would be impossible, if in times of scarcity of work, the Works had to be shut down. On the other hand, such drastic action would be inevitable if a large part of the work such as armaments, were removed from the realm of private enterprise.

Costs.—A comparison of costs of production as between a State-owned organisation and a private concern is one which presents very considerable difficulties.

To take as a case in point, Warship building; it is obvious that in a State-owned establishment where the State is able to provide sufficient work to maintain a steady and continuous employment, it is possible that in consequence a comparison of costs of production of such an establishment with those of a private concern might be found to show to the advantage of the State-owned concern. On the other hand, in the case of a private shipbuilding establishment which in addition to Warship building is able to obtain a reasonable amount of mercantile shipbuilding, the costs would be definitely lower than those of a State-owned organisation. Any private concern which is endeavouring to obtain a share of merchant shipbuilding must of necessity endeavour to keep its Standing Charges and production costs as low as possible in view of the very strong competition which it has to meet from other similar establishments, and it can be shown that Warships built in private yards, while yielding a reasonable profit to the builders, still cost the Country less than similar ships built in Government yards. It must, however, be borne in mind that in the case of Vickers-Armstrongs, which specialises in shipbuilding and other highly specialised forms of armament manufacture it is essential that a highly trained and efficient Staff and the most up-to-date plant and equipment should be maintained and on this account there is a tendency for Establishment Charges to be higher than in the case of a concern whose only interest is mercantile shipbuilding and/or general engineering. It is pointed out, however, that while commercial shipbuilding and engineering cannot make, under to-day's conditions, any very large contribution towards the necessarily heavy establishment charges incurred by the highly specialised forms of manufacture referred to above, the effect of such work is to tend to lower the charges which would fall to be borne by armament production.

It is pointed out that in regard to many of the large Government contracts, before prices are agreed in respect of the supplies involved, a thorough examination of charges, and of estimates of materials and wages is made by the Government Department concerned and care is taken by their investigators to see that a reasonable proportion of the Establishment Charges is borne by the commercial work.

Development and Research.—All branches of engineering, whether directed to the production of armaments or to any commercial engineering problem, depend vitally upon research. The results of research do not depend upon flashes of intuition; invention rather is the product of intimate experience of existing processes and sound foresight of future requirements, combined with technical ability of the highest order. It will be conceded at once that

stimulus to research and invention is most often the result of competition. It is the truth of these considerations which explains the fact that the vast majority of vital engineering inventions have had their origin in private enterprise. A very large number of examples might be quoted, but to mention only a few, we have the variety of special steels which are so essential, not only in Gun constructions but in every phase of engineering experience; the Parsons Turbine, the Diesel Engine, the Water-tube Boiler and, on the armaments side, Hydraulic Gun Mountings and the Automatic Gun. In the event of the State assuming the manufacture of all armaments, it may be argued that commercial competition would still exist and might suffice for progress in ordinary engineering problems, but nevertheless, progress in the specialised essentials of armaments is vital to our main consideration of National defence and security, and undoubtedly, the development of Marine Engineering in this country has been due to the collaboration between the Admiralty and the private firms, the joint experience being of the greatest value to the Marine Engineering Industry of the country. This is exemplified in the case of the *Queen Mary*, the machinery of which ship could not have been designed without the joint experience of the Admiralty as users of High Power Turbine Machinery and of the private firms as designers and manufacturers. Similarly, there is no doubt that the very heavy forgings of special Alloy Steel required by Imperial Chemical Industries for the new Plant at Billingham recently erected for the production of Oil from Coal by the Hydrogenation process could not have been manufactured without the accumulated knowledge of the three principal Forgemasters, which they could not have acquired but for their long experience in the manufacture and heat treatment of Special Armament Forgings. Therefore, it appears unwise to confide this matter of development and research to a purely national organisation which would be denuded of competition and the stimulus of continuous consultative collaboration with commercial engineering experts.

Foreign Trade.—If there was a State monopoly of armaments manufacture it follows that either the State would supply foreign countries with armaments, or foreign countries could not obtain them in this country. It is unquestioned that all armaments, and particularly ships of war, constructed in this country are in particular demand universally, this fact probably finding its explanation in the unique tradition and proverbial efficiency of the British Navy, and therefore the abolition of private manufacture would entail the loss to this country of an export of considerable importance with corresponding injurious effect on employment.

If the export of Armaments is prohibited, it would probably have the direct effect of multiplying armament organisations throughout the world and this would militate against the extension of any practical system of international control. Under the present system, the matter of foreign trade is one of importance and a factor of value technically and economically to the industry and to general progress.

In the first place, it keeps British firms in close touch with armament activity throughout the world in virtue of ordinary competition. Secondly, foreign orders are essential to provide that volume of work which helps to stabilise employment and to provide experience for personnel in specialised armament work, in those periods when, of necessity, the experience for personnel in specialised armament considerations primarily which contribute to the great value of foreign trade in a private armament works.

Owing to the particular demand for British armaments and particularly British warships, British armament Works and Shipyards certainly have enjoyed greater employment from foreign sources than those of other countries and it would be an economic

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

loss if this precedence were lost. To quote a particular instance of the value of competition with foreign firms in defensive armaments, we may cite the case of Anti-Aircraft Defences, a matter in which many Governments are interested at the present time. If the British armament firms did not compete in this field, the potential loss in specialised experience to the country would be serious.

National Defence.—If armament firms are abolished, it is submitted that at one stroke we limit drastically the power of adequate expansion in the emergency of war. We limit development and invention in its relation to all branches of engineering activity, which may be so urgently necessary in general munition production. It follows that severe limitation of these three essentials is the very reverse of preparedness.

Experience during the late war demonstrated that a private armament firm is peculiarly adapted by its organisation for extremely rapid increase of output. The Vickers Barrow Works alone were responsible for the following numerical examples of urgently required armaments—4 Battleships, 4 Cruisers, 4 sets of Machinery for Cruisers, 6 Auxiliary Vessels, 53 Submarine boats of all types, 62 vessels for transport and river work; these together giving an aggregate displacement tonnage of something like 170,000 tons; 9 Airships and many associated forms of aircraft, together with something like 16,000,000 Shell, over 2,000 completed Gun Equipments and approximately 1,000 Limbers for Howitzer Mountings. This list is quite irrespective of the large number of modifications and conversions of armament supplies that were demanded with

extreme urgency. It is not practicable immediately to expand the national armament organisations so that they could satisfy the urgent demands to which they would be subjected, which demands unquestionably constitute the vital exigency of war. In the first place, it would be necessary to multiply, distribute and maintain in peace time in various industrial areas, the National Arsenal and Dockyards and to equip and staff them adequately. Dealing, as they would be, exclusively with armaments, there would certainly be long periods when they would stand idle. Machinery would deteriorate and become out of date and a standing staff of the necessary magnitude would prove an irksome burden on the National Revenue. Research and development would be very seriously hampered and the absence of foreign competition would militate against fertility in invention.

Allied commercial work, as we have asserted, absorbs a share of Establishment Charges in private organisations and what is of even greater importance, we have seen that it provides for that interaction of Staff, equipment, and supervision which enables armament work to be undertaken in the normal course, without the formidable initial charges which would occur from time to time if the work were intermittent. The relative amount of armament and commercial work which is carried out by a typical armament works such as Vickers-Armstrongs, Barrow, is shown in the following chart which covers the years 1917 to 1934. This chart illustrates the distribution of the work which is so important in reducing costs, maintaining adequate organisation and stabilising employment.

BARROW—ORDERS BOOKED.

Control of the Industry.—Unrestricted export of armaments to all potential purchasers might very definitely engender certain evils, such as brigandage and allied unlawful activity. Unrestricted export of armaments, therefore, while it would not have any appreciable effect on the business of reputable firms, might encourage the growth of small mushroom armament firms of doubtful standing, and so flood the market with inferior materials to the severe detriment of British industry and prestige. For this and other reasons Vickers-Armstrongs wholeheartedly support the present Licensing System in force in this Country.

This system is administered with vigilance in which Vickers-Armstrongs collaborate to the utmost of their power, in conjunction with the Defence Departments. In consequence, there is very little doubt that the system is effective in preventing any of the abuses which might conceivably result from inadequate supervision. In criticism of the system, the comment has been made that only very few licences have been refused since the Arms Convention has been ratified by this Country. This circumstance is capable of a very simple explanation. Very many inquiries are received from abroad which are, obviously, undesirable. Such inquiries are at once

rejected by the firm without reference to any Government Department. In other cases, where inquiries involve questions of technical or tactical interest to the Defence Departments the appropriate Department is at once consulted. As a result of this policy, many potential contracts have been abandoned without reference to the Board of Trade. It follows that before a request for an export licence is finally submitted to the Board, the circumstances have already been the subject of critical consideration from all points of view. Hence it is only on very infrequent occasions that the Board of Trade has had cause to raise objection to issuing a licence. On the other hand, the expansion of British industry and the furtherance of British trade in the world markets is of primary interest to the Government.

The licensing system not only works smoothly and efficiently in this Country but there is very little question that if a similar system were adopted throughout the world, administered with energy and justice, it would provide a completely efficient check on the abuses that are alleged to have become apparent. On the other hand, if armaments exports are unchecked in other countries, the possibility of abuses will inevitably continue to cause anxiety and so perpetuate general disquietude.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: The only point is on the section headed "Labour," where at that time I said that we "employ to-day approximately 30,000 people." Well, yesterday the employment at Vickers-Armstrongs was 36,200 people. I should like to record that.

2218. *Sir Thomas Allen:* Could you tell us what proportion of those is on armaments? Is that a total increase on armaments?

Sir Charles Craven: I could not tell you. A considerable proportion of that extra 6,000 are on armaments, but we also have orders for a large passenger ship. It is very difficult to tell you off-hand, but to take the particular works where a great deal of that work has gone through during the last few years, it has been employed roughly 50 per cent. on armaments—that is, calling a warship armaments.

2219. *Mr. Spender:* There are a certain number of women employed, I suppose?

Sir Charles Craven: Yes, and I can give you the details. I thought you would probably be referring to the skilled man question, and I have the whole statement for you then.

2220. *Chairman:* Then if there is nothing more you want to say on Statement No. 2, we had better have Statement No. 3, which was in answer to our questionnaire. Will you read that?

Sir Charles Craven: I have a covering statement which I should like to read to you.

2221. *Chairman:* Yes. I thought we would have the Statement read first, and then your covering statement.

Sir Charles Craven: I will ask (Mr. Reid Young to read the answer to the Questionnaire. There is a good deal of accounting in that.

Mr. Reid Young (reading).

STATEMENT No. 3

In considering the answers to the questions set out in the Commission's letter of the 23rd April* last and in particular in regard to the opening paragraph of the letter in which information is asked relative to "Messrs. Vickers Limited, Messrs. Vickers-Armstrongs Limited and any Subsidiary Companies under their control", there are certain general points to which the Commission's attention is asked. It is pointed out that the Vickers Group of Companies consists of:—

- (a) The Parent Company, Vickers Limited.
- (b) Certain wholly owned manufacturing Companies.
- (c) Certain partly owned manufacturing Companies.
- (d) Finance Companies wholly owned.

Vickers Limited itself carries on no manufacturing or sales activities and therefore certain of the questions asked are inapplicable to it. This refers particularly to the following:—

- (1) Turnover.
- (2) Turnover divided between British and foreign orders.
- (3) Value of plant employed in the production of arms.
- (4) That portion which deals with the proportion of profits attributable to the production of arms and munitions of war.
- (5) Employees engaged on the production of arms.
- (6) The firm's capacity for expansion for production of arms.

With reference to Classes (b) and (c), manufacturing Companies both wholly and partly owned, it is pointed out that certain of these Companies are not in any way engaged on the manufacture of arms or munitions of war. As it is assumed, however, that the information asked for is desired in respect of the whole Vickers Group of Companies, the questions asked (so far as they are applicable) have been answered in regard to all Companies whether manufacturing arms or not.

In regard to Class (d) (wholly owned Finance Companies), the only questions which appear to be applicable are No. 4 (amount of declared profits), and No. 8 (details of the Company's holding of capital of other Firms).

QUESTION 1.

The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war.

Appendix 1† sets out in detail the information asked for, and, in accordance with the arrangement made with the Secretary to the Commission, the

relative information in regard to each manufacturing Company in the Group is shown separately. Generally speaking, the basis adopted has been the amount of sales invoiced by each particular Company for the years in question, but in certain instances it has not been possible to adopt this basis owing to the nature of the contracts involved. However, it is explained that the figure given in each case represents the total amount credited to the final Trading Account of each Company concerned for each year in question.

No figure is included in this schedule in respect of Vickers Limited, in view of the fact that, as already explained, it is a Holding Company and carries on no manufacturing or selling activities.

QUESTION 2.

The proportion of the turnover in each of the last five years representing arms and munitions of war, attributable to (a) United Kingdom, (b) British Empire, and (c) foreign, orders.

Appendix 1 gives the information asked for as well as that required by Question 1, but it is pointed out that it has not been possible to separate the turnover as between the United Kingdom and the British Empire as requested. This is due to the fact that in many cases material required by the Dominions and Colonies is ordered by the appropriate British Government Department in London, that is either the Admiralty, War Office or Air Ministry, and in many cases the ultimate destination of the material is not known to us. Certain orders are, of course, received direct from certain parts of the Empire, but it is felt that with the information at our disposal the figures cannot be reliably divided as between the United Kingdom and the British Empire.

QUESTION 3.

The estimated value of plant employed in the production of arms and munitions of war that would be rendered redundant in the event of the establishment of a State Monopoly.

Appendix 3* gives the information asked for. In answering this question it has been assumed that the word "plant" used in the Commission's letter is intended to mean the complete layout of Works, i.e., land, buildings, plant, loose tools, etc. It has also been assumed that the information required is the estimated cost to the Government of purchasing similar plant of similar age and condition for the production of arms and munitions of war in the event of the establishment of a State Monopoly. With this factor in mind the estimates have been prepared by the Engineers of the respective Companies on the basis of the estimated replacement value of the assets concerned. It is desired to

* See p. 345.

† See p. 402.

* See p. 403.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

emphasise the fact, however, that such valuations, to be reliably compiled, would require a much longer time than has been available to us, and the figures given in Appendix 3 are, therefore, put forward with all reserve in an endeavour to put some helpful information in the hands of the Commission. With regard to the following Companies, viz.:—

Vickers-Armstrongs, Limited,
 Vickers (Aviation), Limited,
 The Supermarine Aviation Works (Vickers), Limited,
 The Whitehead Torpedo Co., Limited,
 The Thames Ammunition Works, Limited,

it is further pointed out that although in some cases a certain portion of the plant is at present and has been during a number of years employed to some extent on general commercial work, it is our view that in the event of the establishment of a State Monopoly of arms and munitions, the whole of the plants would necessarily be redundant for the reason that they have been laid down primarily for the production of armament material and it would not be possible to maintain any of them as going concerns on commercial work alone.

In the case of English Steel Corporation, Limited, only certain parts of its plant have been dealt with, but it is pointed out that the removal from this Company of the munitions manufacture, which at present forms part of its output, might have a far-reaching effect on the remaining portion of the Works and, while the figures are put forward for the purpose of answering the question as far as possible, these again are given with all reserve. In regard to The Darlington Forge Limited, although that Company is at present non-operative, it has always been the intention of the directors to re-open its works provided that a sufficient volume of work could be foreseen to justify such a decision, but if armament manufacture be made a State Monopoly, it is quite clear that the plant of English Steel Corporation, Limited, in the absence of armament manufacture, would be ample or more than ample to meet the requirements of commercial work alone.

With regard to Cooke, Troughton & Simms Limited, which Company undertakes a certain amount of armament work, it will be seen that in Appendix 3 no part of the plant has been earmarked as necessarily redundant in the event of the establishment of a State Monopoly. This view of the matter is correct if the Company were able in that event to obtain such an increased volume of commercial business as would compensate for the loss of Armament turnover. In actual practice, of course, this hope would probably not be realised, and in that event plant of considerable value would become redundant.

QUESTION 4.

The amount of declared profits of each of the last five years; and an estimate of the proportion thereof attributable to the production of arms and munitions of war.

Appendices 4*, 4a* and 4b,* give the information requested in detail in so far as it is applicable, but, as submitted in the covering letter, it is suggested that the information given in Appendix 4† is sufficient for publication.

In regard to the request that copies of the published accounts of the Companies for the five years should be provided, it is pointed out that only in the case of the following Companies are accounts published, these being the only Public Companies in the Group namely:—

Vickers Limited;
 Vickers-Armstrongs Limited;
 English Steel Corporation Limited;
 The Darlington Forge Limited;—(converted to Private Company before issue of Accounts for

1932—went into voluntary liquidation for purposes of reconstruction, 16th November, 1933); The Ioco Rubber & Waterproofing Co., Limited; Metropolitan-Cammell Carriage, Wagon & Finance Co., Limited;—(went into voluntary liquidation for purposes of reconstruction 31st October, 1934);

and copies of the printed accounts in each of these cases are appended.

The Metropolitan-Cammell Carriage & Wagon Co. Limited, formed on 31st October, 1934, is a private company, as is also the present Darlington Forge Limited.

All the other companies in the Group are also private companies and, therefore, there are no published accounts.

It has been considered that it would make the position clearer to the Commission if the companies in the Group were sub-divided, and accordingly the Appendices show:—

(1) *The profits of Vickers Limited—Appendix 4*.*—By way of explanation it is pointed out that the profits of this company during the five years in question have been derived, generally speaking, from the following sources:—

(a) From dividends on shares held in manufacturing companies in the Group whether arms producing or not.

(b) Income from the Company's investments in finance companies and in British Government securities.

(c) Sundry items.

In regard to (c), the items comprised in this heading are profits brought in to the Company's accounts as a result of the terms of the Vickers-Armstrongs amalgamation agreement of 1927 under which part of the profits accruing from certain contracts taken by the transferor companies prior to the amalgamation were retained by the respective companies. Also included are the losses sustained by a subsidiary company, Messrs. Vickers (Crayford) Limited on certain commercial trading activities carried on during the year 1930-31, which losses were written off in the books of the parent company. It has been thought advisable in view of the special nature of these items to include them under a special heading, and it is pointed out that although a certain portion thereof was derived from armaments contracts they have not been included in the figures shown by Vickers-Armstrongs Limited.

2) *The profits of the companies which are either wholly or partly engaged in the production and/or sale of Munitions of War.—Appendix 4a*.*—In regard to Vickers-Armstrongs Limited in particular, it is pointed out that the accounts of the Company as ordinarily prepared do not show the final profit earned from the manufacture and sale of armaments as distinct from commercial products. There are, as will no doubt be appreciated, many items of a general nature which in the accounts of the Company are charged directly to Profit and Loss Account and are not allocated specifically to any particular production. It has therefore been necessary, with a view to affording the information asked for by the Commission, to adjust the accounts in such a manner as to show as nearly as possible the actual final trading results in regard to armament manufacture and sales as distinct from other products and for this purpose, as well as making the adjustments mentioned above, to eliminate also credits and expenses directly attributable to purely financial transactions. It will be noted also that the calculation of profit is shown in the first instance without deduction of certain necessary charges against profit in the nature of provision for bad debts and for a heavy item of expenditure of removal of the Erith Works to Crayford. In the case of English Steel Corporation Limited and Darlington Forge Limited

* Not printed.

† See p. 404.

* Not printed.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N. Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

(Old Company), it has been necessary to make adjustment for very heavy expenditure which was necessary in connection with the reorganisation of those companies. The final column of Appendix 4a, therefore, in the case of these particular companies, shows the profit after adjustment in respect of these items.

(3) *The profits of the companies wholly engaged in the manufacture of commercial products—Appendix 4a.*—It will be noted that certain necessary adjustments have been made.*

(4) *The profits of the Subsidiary Finance and Estates Companies of the Group.—Appendix 4b.*—In these cases the total profits of the companies are derived from interest, dividends, rentals, etc., received and are in no way connected directly with armament manufacture. It has therefore not been considered necessary to show any details of these.*

QUESTION 5.

The average number of employees engaged in each of the last five years on the production of arms and munitions of war and other products respectively.

Appendix 5.†—In some cases it has been difficult to answer the questions as framed in view of the fact that certain of the departments at all of the works of Vickers-Armstrongs Limited and of some of the other Companies in the Group are general departments which are applicable either to armaments or commercial work. Accordingly a proportionate basis has been adopted, and the employees in such departments have been allocated on the basis of productive wages expended on armament production and commercial work respectively. Staffs have been dealt with on the same basis.

QUESTION 6.

The firm's capacity for expansion for purposes of the production of arms and munitions of war (a) with (b) without, the use of plant normally employed on other products. What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war?

Reply not printed.

QUESTION 7.

Particulars of any agreements with other firms engaged in the production of arms and munitions of war stating the names of the parties, British and foreign, to such agreements.

Appendix 7* gives a summary of agreements for each Company in the Group. It is pointed out that it has been considered desirable to make this list comprehensive and it will, therefore, be found that it includes many agreements which do not refer in any way to arms or munitions of war, but these have been included on the basis that they are agreements between Vickers Companies and other Companies which we believe are engaged in or connected with the manufacture of arms and munitions of war. Similarly it will be found that the list includes agreements between the Vickers Companies and private individuals, which information, we understand, has not been requested by the Commission, but it is given in case it may be of interest. It will be found that such agreements largely refer to licence arrangements.

It is pointed out that in the ordinary course of business certain of the Companies in the Group are members of trade and similar associations, and where to our knowledge any other armament firm is a member of an Association particulars are given. We would mention, however, that the Companies in the Group are members of many ordinary trade associations, particulars of which would presumably not be relevant to the present enquiry. These are

merely ordinary exclusive buying and rebate agreements generally, which are not in any sense peculiar to the armaments industry.

In the event of the Commission requiring copies of any of the agreements we shall be happy to supply them.

QUESTION 8.

Details of the firm's present holding of the capital of other firms, giving names (British or Foreign) and of the holdings of the firm's capital by other firms, giving names (British and Foreign).

Appendix 8* gives the information asked for relative to the first part of this question in regard to the various Companies in the Group. With reference to the second part of the question, namely, the holdings of capital of the Vickers Group of Companies by other firms, the information is given on Appendix 8a* for all Companies other than Vickers Limited. Regarding Vickers Limited, however, the register of members has been scrutinised with a view to seeing whether or not any Company, which to the best of our information is engaged in armament production, holds shares in that Company. The name of only one Company which may have some connection with the armament trade has been found; this is a French Company called Société Alsacienne d'Explosifs, which holds 1,000 ordinary shares. In fact, we have no knowledge of the trade carried on by the Company concerned. It is pointed out, however, that the shareholders of the Company number approximately 65,000 and there are, as in all Companies of this size, a large number of holdings in the names of nominee Companies, and, it may be, in the names of individuals who are likewise nominee holders. It can, however, be definitely stated that there are no arrangements or agreements to which Vickers Limited is a party under which any Company engaged in the manufacture of arms and munitions of war or, in fact, any Company or individual whatsoever either at home or abroad, holds shares in the Company.

Similarly it can be stated definitely that no bank or financial house, British or foreign, has any controlling interest in the Company or has any part in the management or direction of the Company's affairs.

QUESTION 9.

The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war.

Appendix 9† deals in detail with the information asked for in this question.

2222. *Chairman:* Just to take the Appendices for the moment. Appendix 1‡ is a statement showing the total turnover in each of the five years from 1930 to 1934 attributable to the production of arms and munitions of war divided between the British Empire and foreign. It is not necessary to go through all the companies, but the two companies with the largest turnover are the English Steel Corporation, Limited, and Vickers-Armstrong, Limited, are they not?

Sir Charles Craven: Yes.

2223. *Chairman:* Let us take the proportion attributable to foreign armaments of the English Steel Corporation. In 1930 it was 1.88 per cent. Is that right?

Secretary: That is the proportion of the total armaments that were foreign.

Chairman: No, it is divided into percentage attributable to armaments, percentage of arms British Empire, and percentage of arms foreign. I am taking that column of the percentages of arms foreign, and that is 1.88. Is that right?

* Not printed.
 † See p. 405.

* Not printed. † See p. 406.
 ‡ See p. 402.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN and Mr. A. DUNBAR.

Mr. Reid Young: Yes.

2224. *Chairman:* And in 1931 it is 0.09 per cent.?

Mr. Reid Young: Yes, of 25.71 per cent.

2225. *Chairman:* And in 1932 it is 1.01?

Mr. Reid Young: Yes.

2226. *Chairman:* In 1933 it is 0.35, and in 1934 it is 0.14?

Mr. Reid Young: Yes.

2227. *Chairman:* Then the other large turnover is Vickers-Armstrongs, and taking it the same way, the percentage of foreign in 1930 is 34.65, in 1931 it is 40.19, in 1932 it is 30.73, in 1933 it is 38.40, and in 1934 it is 45.63. Is that right?

Mr. Reid Young: Yes.

2228. *Chairman:* Then Appendix No. 3* contains the estimated value of lands, buildings, and so forth. I need not refer to that, I think. Appendix No. 4† is the form in which you have summarised the contents of the other appendices which are not published?

Mr. Reid Young: Yes.

2229. *Chairman:* That gives the replacement value of armament land, buildings, etc., annual value of armament turnover, profit after charging special expenditure, and profit before charging special expenditure. What would be included in the special expenditure there?

Sir Charles Craven: The closing of the works was one special item, Sir, and special compensation of staffs.

2230. *Professor Gutteridge:* Did it include anything for breach of contract?

Sir Charles Craven: No; compensation for loss of office.

2231. *Professor Gutteridge:* Only?

Sir Charles Craven: Yes.

2232. *Chairman:* Then in the rest of the document you give the percentage of profit to replacement value, and the percentage of profit to turnover. I need not trouble about that. Appendix No. 5‡ shows the average number of employees engaged in each of the last five years. Then Appendix No. 9§ is "Statement of the Practice of the Firm in regard to the Advertisement of, and the Soliciting for Orders for, Arms and Munitions of War." I see there is a definite statement there with regard to some questions that were put to you by Dame Rachel Crowley, on the section headed "SOLICITING FOR ORDERS." You say: "The selling arrangements of the company being as outlined above, it is emphasised that there is no general practice of soliciting for orders for armament material. Only where it is definitely known that the government is in the market for a certain type of material, and where the agent of the company concerned so recommends, does the company send representatives, technical or otherwise, abroad." Then I also see there that the agent obtains a tender, and the acceptance of the order by the company.

Sir Charles Craven: Entirely.

2233. *Chairman:* Then there is a long statement showing the amounts paid for advertising, and there is a standard agency agreement for Vickers-Armstrongs' agents, and a standard agreement for Vickers Aviation, Limited. That comprises the whole of the information which you think should be made public, and the rest of the appendices are material which you supply to us and think it is either against the public interest or your private interests that they should be published?

Sir Herbert Lawrence: Yes.

2234. *Chairman:* Then you have a statement which you wish to make to us in addition to that, have you not?

Sir Charles Craven: Yes, Sir. It is very short. Before I do that I wish to submit that we have received a letter from Mr. Walton Newbold telling

me that the evidence already given* with regard to Mr. Loewe, who was a managing director of Vickers over thirty years ago, is not correct. He tells me that he knows he was still a director of the Deutsche Waffen Company, and of another company the name of which I cannot read, in Germany, while he was with Vickers. He died in 1903. I wanted just to correct that, if I might, and apologise.

2235. *Chairman:* Thank you. Now will you read your statement?

Sir Charles Craven (reading):

I have very little to add to the opening statement which has been made by Sir Herbert Lawrence, the chairman of our parent company, but there are one or two points which I would submit for the consideration of the Royal Commission.

We have given careful consideration to the question of submitting replies to the evidence offered by various witnesses who have already appeared before the Commission, but we feel that having answered in writing as fully as we possibly can the various questions that have been addressed to us, no good purpose would be served by our submitting a long statement. We sincerely hope, however, that the members of the Commission will, in the questions they address to us, give us an opportunity of replying to many of the points raised by previous witnesses, as we feel it would be wrong for many of the allegations to stand as fact when we know they cannot be substantiated.

In the statement put forward by the Union of Democratic Control certain very serious charges were made against the efficiency of the English Steel Corporation Ltd., which corporation operates the principal steel industries of our country. Sir William Jowitt, who put forward the Union's case, when asked by the Commission if he was in a position to produce witnesses, frankly admitted that he was not able to do so. The English Steel Corporation felt that as these particular charges of inefficiency could be categorically denied it was right that we should submit a statement giving the facts of the case; and as chairman of the corporation I have brought with me three whole-time directors of the corporation who can support the statements made in our memorandum.

2236. *Chairman:* Please stop there for a moment. That deals with the question that I referred to at the opening of the sitting to-day. On these technical questions if necessary we shall have to take technical advice. They are not matters which we can dispose of otherwise.

Sir Charles Craven: I submit, Sir, that technical experts will have to visit the plant to see whether we are telling the truth or not.

(Reading) Sir Herbert Lawrence in his opening letter to the secretary of the Commission particularly refers to the agreements that have already been made public by the United States Inquiry and offers a full investigation into these agreements and the fullest publicity regarding them. I submit a memorandum‡ which briefly summarises the association between ourselves and the Electric Boat Company and also gives some explanation regarding my personal correspondence with the directors of that company, and particularly with the vice-president, Mr. Spear. As my personal reputation has been attacked I should, quite apart from the interest of my company in this matter, welcome the opportunity of replying in detail to any questions which the members of the Commission may see fit to put to me.

I wish to take this opportunity of explaining in general terms the circumstances in which these letters were written and I submit to the members of the Commission the fact that I have known Mr. Carse, the present president of the Electric Boat

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

Co. for over 15 years and a close friendship has existed between Mr. Spear, the vice-president of the Electric Boat Co., and myself, for over 23 years. Under these circumstances the correspondence which passed between us was not couched in ordinary business language but in colloquial language, such as is used when writing to close personal friends. From the fact that all such correspondence was clearly marked as "personal" or in some equivalent manner it will be appreciated that it was never anticipated that these letters should form part of the official business records of either company. The members of the Commission will, therefore, no doubt understand that the terms used in certain of the letters, and out of which great capital has been made, did not imply the meanings which have been attached to them and I can explain in detail to the members of the Commission, should they feel disposed to address questions to me on the subject, that this was the case. In this connection also I would like to inform the Commission that immediately these letters became public through the American Inquiry, in view of reference to certain high officials at the Admiralty contained therein, I wrote an explanatory letter to the First Lord of the Admiralty. I wish to hand to the Commission a copy of that letter* together with a copy of the reply which I received from the First Lord.† I have obtained his authority to do so.

Another point on which efforts have been made to make much capital by the critics of the private manufacture of arms is that of the employment of ex-government officials and in certain of the statements put before the Commission various names have been instanced. The Commission will undoubtedly recognise the fact that in appointing such ex-government officials to positions with the company whether on the board or otherwise there are no ulterior motives in the minds of the directors, it being obvious that a company whose business is the manufacture of armaments must obtain the benefit on its staff of men with expert knowledge as users of its products and user knowledge can obviously only be obtained by the engagement of retired specialist officers.

Certain of the witnesses who have appeared before you, in particular Dr. Addison, have severely criticised the private manufacturers of arms for their alleged failure at the outbreak of the Great War. The Commission will no doubt have noted that any criticism on this count has been made because of the shortage of material for supplying the army. No criticism has been made that the needs of the navy were not fully and adequately met. I would like to take this opportunity of pointing out to the Commission that before the War, with the exception of one period in 1906 and 1907 when the army was being re-equipped, the amount of orders received by Vickers Limited from the War Office was negligible, whereas the company had been very largely occupied during that period in supplying the needs of the Admiralty. It therefore will be obvious that by relying to a very large extent on the resources of private manufacturers the Admiralty obtained satisfaction in regard to all its requirements, and that even on the outbreak of war the increased needs of that department were satisfactorily dealt with. It could not be expected that the War Office, which had not been placing orders of sufficient magnitude to ensure that sufficient plant and personnel was available for an emergency, could obtain the necessary sudden expansion of capacity from the private manufacturers. Then I have written in those figures which I gave you this morning—that the average orders from the War Office were £55,000 a year and from the Admiralty £2,588,000.

I feel sure that on examination it will be found the army expansion in the Great War was never

foreseen and that even some months after the declaration of war the requirements of supply were found to be very much greater than was anticipated in August, 1914, and, therefore, whatever pre-War organisation had been set up, the demands, particularly for ammunition supplies, became so tremendous that measures had to be taken which had never been considered as likely to be necessary.

Much has been stated about the efficiency of the National Shell Factories which were set up by the Government. We would remind the Royal Commission that the majority of these shell factories were laid out, equipped, and, certainly in some instances, managed by the armament firms. Comparisons of cost have been made between these modern mass production shell factories and the modest pre-War shell shops being operated by the principal armament companies in the early stages of the War. No such comparison is justified, as the private shops dealt with many types of projectiles with a relatively small output; and we would further submit that when comparing the output from the private shell shops at the beginning of the War with that of Woolwich, consideration should be given to the volume of pre-War orders placed with the private firms and Woolwich Arsenal.

No doubt the Commission will be informed by the Service Departments of the position in regard to supplies which exists to-day, and I feel sure that evidence will be forthcoming which will show that where any specially urgent demands have been made on private industry since the War, the companies concerned have in every case risen to the occasion.

A typical misunderstanding regarding the secrecy with which armament firms are stated to carry out their businesses may be corrected when I inform the members of the Royal Commission that at the present time we have in the various works of Vickers-Armstrongs and its associated companies no less than 521 inspectors appointed by the Government. The rank of these inspectors ranges from senior naval officers, who inspect work under the warship, armament and steel contracts, down to the junior women inspectors in the fuse departments.

2237. *Chairman:* May I ask if those are whole-time inspectors?

Sir Charles Craven: Whole-time; yes, Sir. They fluctuate according to the amount of work we have in hand.

2238. *Chairman:* At whose charges are the 521 inspectors?

Sir Charles Craven: The taxpayer. They are government servants. We have nothing to do with them.

2239. *Chairman:* They are nothing to do with you?

Sir Charles Craven: No, Sir.

(*Reading*) It appears that considerable difference of opinion has been expressed by various witnesses regarding the necessity of skilled men in the armament industry. As I believe this to be a very important matter, I have prepared figures showing the numbers of skilled, semi-skilled and unskilled people employed in the various branches of our organisation, which I will hand to you if you desire.*

2240. *Chairman:* When I used the term "whole-time", what I meant was: Are they people who pay casual visits, or when there is work for them to do, do they remain at the factory the whole day?

Sir Charles Craven: I should say that 95 per cent. of these people are whole-timers; but at Sheffield they have a central office of their own in the town, and they go from one firm to another; but even in Sheffield there are some full time inspectors at our works as there are in Barrow.

(*Reading*) In conclusion I submit that in view of the very large capital and research expenditure which has been undertaken by Vickers-Armstrongs, its subsidiaries and associated companies during the last few years and the special steps that have been

* See p. 379.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAFF, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

taken to train personnel in the most accurate form of engineering, an independent examination would abundantly show that the group of companies is efficiently managed and is equipped with plant and personnel at least as good as that in any other company in the great industries of the country.

That is all I have to say, except just to correct the figures that were given when we sent in our return. The figures of employment of Vickers-Armstrongs, as I mentioned before, including the English Steel Corporation, are 36,200 to-day, and the Vickers Company, directly under Vickers—that is, the various companies—10,569; so that Vickers Limited, as a whole, is employing to-day 46,769 people. I do not suppose you want me to read the letter from me to the First Lord. It is very long. It is on the record.

2241. *Sir Thomas Allen*: We had better make the correction of the date, I think, from 1917 to 1927.

Sir Charles Craven: Would you like me to read it?

2242. *Sir Thomas Allen*: That ought to go in, that it was written not in 1917, but in 1927.

Sir Charles Craven: It was implied in the newspapers—but I do not think before the Committee in America—that this had been going on in 1917, when there was a war on.

2243. *Professor Gutteridge*: Might I ask Sir Charles something on this? In your letter to the First Lord you set out what you say is the correct version of that letter. That is so, is it not?

Sir Charles Craven: Yes, Sir.

2244. *Professor Gutteridge*: Had not you better read that, do you not think? If it differs from the letter as stated in the American report, had you not better read it?

Sir Charles Craven: Well, Sir, as stated in the American evidence it is correct, but not as stated in the English newspapers which came out then, when I saw a leading article headed "His Admiralty Friend," I think.

2245. *Chairman*: I think it is rather suggested it would be wise to read this letter. It will not take more than a minute or two.

Sir Charles Craven (reading):

19th September, 1934.

The Rt. Hon. Sir Bolton M. Eyres Monsell,
 G.B.E., M.P., The First Lord of the Admiralty,
 London, S.W.1.

Dear First Lord,

I am venturing to trouble you with this letter because I feel that some explanation is due to you from me in connection with the reports that have appeared in the Press of certain evidence given at the Enquiry into the Armament industry now being held at Washington.

These reports allege that a letter written by me in 1917 to Mr. L. Y. Spear, Vice-President of the Electric Boat Company of America, and produced before the Committee of the U.S. Senate, contained the following passage:—

"We have received invitations from the Admiralty for one, two or three submarines. Armstrong Whitworth has, too. Armstrong will put in their bid. Whatever the price, I shall tell Armstrong to put the price slightly above ours so that whatever is built will be built by Barrow.

My friend at the Admiralty will help us, as he tried to get all five submarines for us last year." You have no doubt noticed that, on the strength of these words ascribed to me, suggestions of improper relations existing between armament firms, and of collusion between contractors and Admiralty officials have been made in certain quarters.

I should like, therefore, to explain that, apart from a mis-statement of the date of my letter to Mr. Spear, which was written not in 1917 but on the 7th October, 1927, the passage in question has been seriously misquoted, and given without its context. The letter was written on the eve of the conclusion of the agreement for the amalgamation of Vickers and Armstrongs (which agreement was actually signed on the 31st October, 1927), and what I actually wrote to Mr. Spear was as follows:—

"Absolutely personal and confidential.

7th October, 1927.

L. Y. Spear, Esq.,
 Electric Boat Company,
 Groton, Conn., U.S.A.

My dear Spear,

By the time this letter reaches you it is possible that we may have come to an agreement with Armstrongs whereby a new Company is formed to take over the shipbuilding and armament sides of Vickers and Armstrongs. The terms are such that the new Company will be run by Vickers. This opens up an interesting question regarding our agreement with you, and it would be necessary to have a discussion when next we meet. In the meantime, however, we have just received an enquiry for one, two or three boats for the Admiralty. Armstrong-Whitworths have also received a similar enquiry. My present feeling is that we should quote for one, two or three from Armstrongs, who have agreed to put in whatever price I tell them, and that we should also quote for one, two or three boats from Barrow. I would keep the Armstrong price very slightly above ours, the idea being that whatever boats were ordered from either party would be built at Barrow, so effecting considerable economies. I also think that perhaps it would be worth while putting forward a tender for six boats, the total number to be built. I have had a word with the Director of Contracts at the Admiralty, who is a friend of mine, and who would like this. He, I know, tried to get us the order for all five submarines last year.

Whatever happens will you give me authority to make the same reduction in your Royalty as we did last year? According to my pocket book we reserved for you £9,000 for one, £7,200 for each of two, £5,600 for each of three, £4,375 for each of four, and £3,600 for each of five, and I suggest to you that we should put in £3,200 for each of six.

I do not know if I have made the matter as clear as I should. At the moment the two firms are not combining in any way, and therefore, if negotiations break down, Armstrong-Whitworths will, of course, be free from us, but the tenders have not to be in until the middle of November, so we should certainly know one way or another before then. Needless to say we do not want anything to come out about the proposed fusion until it is all clear, and I am just sending you this letter so that you can think over the situation."

As regards the general tenor of these remarks, you will see that I was expressing my opinion that as the Vickers-Armstrong agreement appeared to be on the point of conclusion—under which it was intended that all submarine building by the new combined firm should be concentrated at Barrow owing to the greatly superior facilities there—no good purpose would be served by Armstrong putting forward a serious competitive tender. I think that the Admiralty will agree that, in the circumstances then existing, that opinion was quite intelligible.

8 January, 1936.] General The Hon. Sir HERBERT A. LAWRENCE, G.C.B., [Continued.
 Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
 Sir ROBERT McLEAN and Mr. A. DUNBAR.

My letter distinctly pointed out that if the proposed amalgamation did not materialise, Armstrong's would naturally be free to put in whatever tender they pleased.

I desire, however, to express my great regret that the particular reference which I made to the Director of Contracts should have been made, even in a personal and confidential letter to a man I had known for over 22 years—realising as I do on reflection, that it could be read as tending to discredit the impartiality of an Admiralty official who is universally respected and trusted.

I was, of course, well aware, from my own experience when serving at the Admiralty, that the decision in matters of such importance rests entirely with the Board, and that it would not be within the power of the Director of Contracts, or any other Head of a Department, to bring about a decision in favour of a particular contractor. A reference to the context of my letter makes it perfectly clear that in expressing my favour of ordering all the submarines from one contractor I took it for granted that he would have been actuated not by any partiality towards any particular firm, but solely by the probability of its being the most economical arrangement for the Admiralty to make.

I think my letter to Mr. Spear will make it quite clear to you that my main object in writing to him was to effect a reduction in the amount of royalty that my company were entitled to pay to the Electric Boat Company under an agreement of long standing, so reducing our price for the vessels.

Yours sincerely,
 (Sgd.) C. W. CRAVEN.

Shall I read the First Lord's reply, Sir? It is quite short.

2246. *Chairman*: Yes.

Sir Charles Craven (reading):

October, 1934.

Dear Sir Charles Craven,

Thank you for your letter of the 19th September. It was obvious to the Admiralty that the statement attributed to you could not have been

written in 1917, as at that date, owing to war conditions, all warshipbuilding in contract yards was on a "time and line" basis. I am glad to have a copy of what you actually wrote in 1927, and I can quite understand the awkward position in which you were placed when the Vickers-Armstrong merger was on the point of completion, and when you felt that no good purpose would be served by Armstrong's putting in a serious competitive tender, and so perhaps receiving a contract which under the merger arrangements would be executed at Barrow.

I am also glad to receive your apology for your unfortunately worded reference to the Director of Contracts. I share your regret that it was ever made, for it was capable of an interpretation utterly at variance with the truth. In allocating shipbuilding orders, the Admiralty are, of necessity, guided chiefly by the prices tendered, though such considerations as the experience and capacity of the various firms and also the desirability of preventing monopoly and maintaining an adequate field upon which the Department can rely, are given weight. I had already, before receiving your letter, examined carefully the files relating to the tenders for submarines in 1926 and 1927, and had satisfied myself that the allocation in each year had been considered carefully and without bias, from these points of view, and had been finally decided by the First Lord himself on the advice of the two responsible Members of the Board, namely the Controller and the Parliamentary Secretary of the Admiralty.

Yours sincerely,

B. EYRES MONSELL.

Commander Sir Charles Craven,
 O.B.E., R.N.

2247. *Chairman*: We cannot have this building to-morrow morning, so we have decided to utilise the opportunity of having a meeting in private; but we shall be able to have accommodation here in the afternoon, and therefore we propose to sit again to continue this evidence to-morrow at 2 o'clock. Will you be able to come here to-morrow at 2 o'clock.

Sir Charles Craven: Yes, Sir.

Chairman: Then we will continue the evidence to-morrow.

(Adjourned.)

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Commander Sir CHARLES W. CRAVEN, O.B.E., R.N. (retired), Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A.,
Sir ROBERT McLEAN, and Mr. A. DUNBAR; representing Messrs. Vickers Ltd. and Associated
Companies: called and further examined.

2248. *Chairman*: Sir Charles, I should like to clear this up. In the information which you have given us in answer to our questions you include particulars of agreements with other firms engaged in the production of arms and munitions of war; you give the dates of the agreements and a short statement of the contents. I am assuming that all those documents are at our disposal to look at, if we call for them.

Sir Charles Craven: Certainly, Sir.

2249. *Chairman*: You have had supplied to you, have you not, a copy of extracts that we have made of particulars referring to passages in the evidence dealing with your firm? We have supplied that in order that we may know which witness would be prepared to deal with the questions that we were going to put. You have that?

Sir Charles Craven: Yes, Sir.

2250. *Chairman*: I will go through that now, asking you questions, not with regard to each item but some of them. On the second page of the document,* Mr. Arnold Forster in his evidence suggests that the armament firms should be questioned as to whether any agreement exists as regards tenders amongst the firms who compete, or ostensibly compete, for Government orders for armour plate. I think that that particular matter was dealt with, was it not, so far as the English firms were concerned, when it was assented to that practically all iron and steel firms engaged in business in England were more or less in association?

Sir Charles Craven: Yes, Sir.

2251. *Chairman*: Does that mean that there is practically no competition?

Sir Charles Craven: For armour plate there are three firms, as I said yesterday, and those three firms have their books examined by the Government and a price is agreed by the Government department concerned.

2252. *Chairman*: If those three firms send in tenders, they are not independent tenders?

Sir Charles Craven: No. The order is placed and very often the price is agreed later. There is no tender.

2253. *Chairman*: But there is no such thing as independent tendering left now, in the iron and steel trade in England, is there?

Sir Charles Craven: We were practically ordered, I think, to build ourselves into an association before we were given the tariff to protect steel.

2254. *Chairman*: I am not asking how it came about, but it is a fact, is it not?

Sir Charles Craven: That is practically the position. I wish to make it clear that there is no real competitive tendering for armour plates for the navy. Every cost is examined by the Admiralty and a price is built up.

2255. *Chairman*: Mr. Arnold Forster also suggests that inquiry should be made as to whether any secret agreement exists between British firms who make military aircraft for the governments of this and other countries.

Sir Charles Craven: I will ask Sir Robert McLean, the chairman of our Aviation Company, to answer that.

Sir Robert McLean: No, Sir. No such agreement exists.

2256. *Chairman*: Thank you. On the next page there is a question which I will ask Mr. Reid Young, if he will, to answer. It is in Mr. Pollitt's evidence. He says that the entire capitalist class is interested in the benefits to be derived from armaments production, and that the control, though not necessarily the ownership, is monopolised in very few hands. Then he produces a chart illustrating the control exercised by important financial interests in the case of Vickers. What is the position with regard to that?

Mr. Reid Young: The position is that no control is exercised over Vickers by any particular body or financial house, or any such arrangement at all.

2257. *Chairman*: You are quite independent of any outside influence.

Mr. Reid Young: Most definitely.

Sir Charles Craven: I think my chairman, Sir Herbert Lawrence, definitely brought that out in his evidence yesterday.

2258. *Chairman*: Mr. Pollitt, on the next page, deals with the Sun Insurance Office policy matter. Sir Herbert explained that to us. I need not ask about that. At the bottom of the page Mr. Pollitt refers to a statement made by Sir Herbert Lawrence in 1934: "Our relations with the three defence services continue to be satisfactory, and though as an armament firm we are the subject of opprobrium in certain quarters, we claim that so long as our products are necessary for the defence of the Empire we are rendering a national service." I understand that is your position to-day.

Sir Charles Craven: That is so.

2259. *Chairman*: I skip two pages; then we come to what Dr. Addison said about deliveries of shells. Have you that passage?

Sir Charles Craven: Yes, Sir.

2260. *Chairman*: Dr. Addison says: Deliveries of shells by contractors to May, 1915, amounted to 1,526,400 against promises 5,729,900. The position with regard to the chief British contractors was: Vickers—promised 907,550, delivered 235,550, arrears 672,000; Armstrongs—promised 1,020,925, delivered 308,090, arrears 712,000. Can you say whether those figures are accurate, according to your books?

Sir Charles Craven: No, Sir, I cannot; but assuming that they are correct—it is going back a long time; I was not in the position I am to-day, but I can visualise the managing director of any of those firms being sent for and begged to promise deliveries or begged to accept orders that he could not possibly do. He was doing his best. I think I have, in the short address I gave you yesterday, pointed out that consideration ought to be taken of the pre-War orders that Vickers received for shells and what we did to multiply our output.

2261. *Chairman*: By that you mean that, having had so few orders before, you were not equipped for large orders?

* Not reproduced.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: No, Sir; I do not believe that the War Office knew the tremendous requirements that they wanted, even in August, 1914.

2262. *Chairman:* There is another reference to Dr. Addison's evidence. He says that the experience of the late War showed that the prices paid to private manufacturers prior to the establishment of a costings system under the Ministry of Munitions were excessive. What have you to say about that?

Sir Charles Craven: I think he compared the cost of a shell produced in our small modest shell shops, to which I referred before, which turned out all kinds of shells, with the cost of a shell that he could get out of a mass production factory. My grievance against Dr. Addison is that he does not give any credit to the armament firms for having equipped those big national shell shops of which he is so proud. We equipped them and managed them in many cases. The shell is not a high-class armament. It is a mass production article and, frankly, Sir, when you hear us in private I hope to explain to you a little more about it. I do not consider that the mass production of shells is a matter that Vickers, or other specialist armament firms, ought to be called upon to undertake. I think it is a waste of energy.

2263. *Chairman:* Whatever the position might have been on the outbreak of war, with regard to the prices charged, have the Government now an efficient system of checking prices for orders given?

Sir Charles Craven: The Government have, and we have too.

2264. *Chairman:* Yes; but the point is this. From the point of view of the nation, is the practice which is now adopted by the Government in dealing with prices charged for armament work sufficient to check any excessive prices being charged or obtained?

Sir Charles Craven: I think so. In some cases they actually get the cost from our books. Of course, if we were inefficient, they would get an inflated cost; but then they have Woolwich Arsenal and other firms by which to check us. There is no collusion or collaboration between the firms. I would like, if I may, to turn back to that word "promise." I do not think it quite fair to talk about the "promises of the armament firms." The armament firms worked day and night, all of them, to do their best and I can quite conceive the directors at that time being pressed to accept work that they did not want.

2265. *Chairman:* Who was the gentleman acting on Vickers' behalf in making those provisions?

Sir Charles Craven: Sir Trevor Dawson, who is now dead. He was then the vice-chairman and managing director. The other director who would deal with cost questions was Sir Vincent Caillard; he also is dead.

2266. *Chairman:* So there is no one from Vickers who was actually concerned in making the arrangements, whatever they were.

Sir Charles Craven: Mr. Yapp was a very junior hand in the contracts department at the time. I do not know whether he could answer.

Mr. Yapp: I could not answer these questions with regard to promises of delivery.

2267. *Chairman:* We have been told by somebody who was there that the result of the interview was that quantities were mentioned and people were asked to undertake the work and they did sign contracts; but at the same time they said "After all, we can only promise what we are in a position to fulfil."

Over the page there is a reference to the Mulliner incident. Are you in a position to give any evidence about what happened?

Sir Charles Craven: No. The only information I have about the Mulliner incident I have obtained from the evidence of the Royal Commission and from gossip. But I will say this: I have done exactly

what Mr. Mulliner is supposed to have done, within the last twelve months; I have given to the Government information that came to me which I thought was of value to them.

2268. *Chairman:* Do you mean in reference to what some other country was doing?

Sir Charles Craven: Yes.

2269. *Chairman:* In reference to armaments?

Sir Charles Craven: Yes.

2270. *Chairman:* Do you know anything about the next incident, the case of the Japanese official?

Sir Charles Craven: No. I have no evidence of any kind about it. It happened before I joined the Vickers Company.

2271. *Chairman:* Or the third incident—about E. J. Reid?

Sir Charles Craven: No. To go back to the Japanese incident, we have searched *The Times* files but they are not very conclusive. The only thing I would say is that if a managing director of Vickers behaved as one is supposed to have done, I cannot understand his being retained in the employment of the company; and he was. There is nothing in our books to show it.

2272. *Chairman:* I think we shall get definite information about the Mulliner incident. We shall have a full statement about it. You cannot help us with regard to the case of the Japanese official?

Sir Charles Craven: We have nothing in our books at all.

2273. *Chairman:* Or about E. J. Reid?

Sir Charles Craven: No. We know nothing about that. Was it about the design of battleships for Chile?

2274. *Professor Gutteridge:* He was a government official, was he not?

Sir Charles Craven: I cannot remember.

2275. *Professor Gutteridge:* Was he not a naval constructor?

Chairman: Yes.

Sir Charles Craven: Watts I can remember. Reid was a great naval architect; whether he was Director of Naval Construction or not, I cannot tell you. This evidence, I understand, is to show that there was competitive design between Vickers and Armstrongs. Is that right?

Secretary: That is the intention of the evidence.

Sir Charles Craven: There would be at that time.

2276. *Professor Gutteridge:* That was before the amalgamation?

Sir Charles Craven: Yes. It must have been pre-war.

2277. *Chairman:* The next case refers to a report in the *Japanese Weekly Chronicle* concerning a Japanese officer.

Sir Charles Craven: Yes, Admiral Fujii.

2278. *Chairman:* If you turn over two pages, you will find that, at the top of the page, Mr. Walton Newbold refers to the question of rings and you see he says that he does not know of anything in the nature of a world ring of armament manufacturers; but that there are signs of local rings, e.g., Vickers have an interest in Spain. That has reference to those small Spanish works, has it?

Sir Charles Craven: That is the small company, the Placencia Company, that is owned entirely by Vickers. Then we have a minority share in the big Spanish company which builds and maintains the Spanish navy.

2279. *Chairman:* "... and they have certain holdings in Japan." You have given us particulars of those.

Sir Charles Craven: Yes.

2280. *Chairman:* They are more or less investments. They are not a controlling interest.

Sir Charles Craven: No. We have nothing to do with them at all.

2281. *Chairman:* Mr. Fenner Brockway stated that British armament firms have produced war materials

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

which have been used against Britain in time of war. Then he says that the Turkish arsenal and dock at the Golden Horn and the naval base at Ismid used against British and Australian troops in the Dardanelles, were maintained up to the very eve of the War by Vickers and Armstrongs. What is the fact about that?

Sir Charles Craven: I think Mr. Reid Young had better give you the history.

Mr. Reid Young: In 1913 an arrangement was entered into between the Turkish Government and Vickers and Armstrongs—that was before the amalgamation—under which Vickers and Armstrongs became technical advisers to the Turkish arsenals and docks. A company was formed called the Imperial Ottoman Docks Company in which Vickers and Armstrongs had certain shares. That company carried on until the outbreak of war in 1914. The docks and arsenals were then taken back by the Turkish Government and kept by them and maintained by them during the War. Subsequent to the War Vickers and Armstrongs were again asked to take up their interest in this company, which they did. That lasted until 1922, I think, when the company went into liquidation and Vickers' and Armstrongs' interest then ceased entirely.

2282. *Chairman:* Before the War had Vickers and Armstrongs had controlling interests in this company?

Mr. Reid Young: No, not controlling interests. They were technical advisers with a minimum interest in the shareholding.

2283. *Chairman:* Who had the controlling interest?

Mr. Reid Young: The Turkish Government.

2284. *Chairman:* That was a business arrangement which lasted up to the time of the War?

Mr. Reid Young: Until the outbreak of war, and was subsequently renewed after the War for a short period.

2285. *Chairman:* How was it terminated at the outbreak of war?

Mr. Reid Young: The Turkish Government took possession of the docks and arsenals themselves, and they were carried on, I understand, during the War under their own supervision.

2286. *Chairman:* You had nothing to do with it during the War?

Mr. Reid Young: No. All the staff who were there were sent home just after the outbreak of war.

2287. *Chairman:* Then Mr. Fenner Brockway goes on to say that the docks of Henry Whitehead & Co. (a subsidiary of Vickers and Armstrongs) at Fiume, in Austria, provided torpedoes, torpedo-boats, torpedo-boat destroyers, submarines and mines for Austria immediately before the World War, and during the War these docks were used to supply the navies of the Central Powers. Was Whitehead a subsidiary of Vickers and Armstrongs?

Sir Charles Craven: I do not know that it was a subsidiary. Vickers and Armstrongs were shareholders in the Whitehead Torpedo Company.

2288. *Chairman:* Had they a controlling interest?

Sir Charles Craven: Yes, they had in 1906. We started in the early sixties at Fiume where Mr. Whitehead, the inventor of the torpedo, started his works, and I am advised that it was at the request of our own Government that Vickers and Armstrongs took an interest in this torpedo company. Then in 1906 we acquired control. At Weymouth we still operate a torpedo company which is entirely owned by Vickers-Armstrongs, and which was incorporated under English law as a separate company in 1907. We still had a shareholding in the main Whitehead company at the declaration of war, had we not, Mr. Reid Young?

Mr. Reid Young: Yes.

2289. *Professor Gutteridge:* What happened to the Austrian Whitehead company in the end? Is that still in existence or has it been wound up?

Mr. Reid Young: The original company went into liquidation in 1924 and then they took them over.

Sir Charles Craven: Our sole interest in torpedo work now is in the Whitehead works at Weymouth, of which I am chairman. It is a branch of Vickers-Armstrongs.

2290. *Chairman:* Then if you turn over the page you see the comment of Sir William Jowitt about transfer of profits. He suggests an example of how profits can be manipulated by the Vickers group, by means of the internal sales of raw materials or partly finished goods at arranged prices between subsidiary or associated firms. Do you know to what he is alluding?

Sir Charles Craven: He says they can be manipulated; he does not suggest they are manipulated. But in any case he is wrong. The Government can check, for instance, a forging coming from Sheffield for a gun. The Government have a right to check anything going into the Vickers-Armstrongs works at Elswick.

2291. *Chairman:* Then, Mr. Noel Baker in his evidence says that there is evidence of a financial connection between the private manufacturers and the Air League, and that the Air League has been active in promoting the cause of "air power." He says that it is a fact worth mentioning that the secretary-general of the Air League, who has been in charge of its affairs during the period of the Disarmament Conference, came to his office from the post of director of Vickers Aviation, Ltd., and another post as director of Supermarine Aviation, Ltd. Is that correct?

Sir Charles Craven: No, Sir. He was with us, but there was a gap of 18 months or 2½ years.

Sir Robert McLean: He left us in November, 1931, and took the post at the Air League in April, 1933.

2292. *Chairman:* That is all I wanted to ask about that. Now I want to ask about some of these letters. What I want particularly to refer to is the agreement which you, or Vickers, made with the Electric Boat Company. Have you these books—*Hearings before the Special Committee of the United States Senate investigating the Munitions Industry?*

Sir Charles Craven: Yes, Sir.

2293. *Chairman:* It is Part I, page 317, and is Exhibit 12. That is a very long document and it has to do, has it not, with the business of making and selling submarines?

Sir Charles Craven: Yes.

2294. *Chairman:* It is confined to that?

Sir Charles Craven: Yes.

2295. *Chairman:* And it provides, does it not, that as between Vickers and the Electric Boat Company certain countries should be excluded altogether from the agreement?

Sir Charles Craven: Yes.

2296. *Chairman:* And that certain other countries should be reserved for Vickers and certain others for the Electric Boat Company?

Sir Charles Craven: Yes.

2297. *Chairman:* And then there is a provision as to the payments that should be made from one to the other in the event of business being done in any of the reserved territories or the common territory. Is that right?

Sir Charles Craven: That is correct.

2298. *Chairman:* Now I want to know what was the business reason for that agreement being entered into?

Sir Charles Craven: May I read a memorandum that I submitted to you, Sir, about the whole history of the business, because it goes back to 1900?

2299. *Chairman:* Is it the STATEMENT BY SIR CHARLES CRAVEN ON THE RELATIONS BETWEEN THE ELECTRIC BOAT COMPANY OF AMERICA AND VICKERS-ARMSTRONGS LTD. Is that the document?

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: Yes.

2300. *Chairman:* Will you read that? Because I think it is important.

Sir Charles Craven (reading):

STATEMENT BY SIR CHARLES CRAVEN ON THE RELATIONS BETWEEN THE ELECTRIC BOAT COMPANY OF AMERICA AND VICKERS-ARMSTRONGS LIMITED.

(1) The negotiations in connection with the construction of the first five submarines for the British Navy were in the first instance conducted in 1899/1900 between the Admiralty and the Holland Torpedo Boat Company, which later became the Electric Boat Company. The first intimation that Vickers had of these negotiations came to them from Mr. Isaac Rice, who was then the President of the American Company. He called on Colonel Vickers and Mr. Albert Vickers, and told them that he was prepared to grant Vickers an exclusive licence for building submarines for the British Navy to the American drawings. He was informed by Colonel Vickers and Mr. Albert Vickers that there was no possibility in their opinion of the British Navy building submarines and, by so doing, lend encouragement to the construction of a type of vessel which, if adopted throughout the world, would seriously jeopardise England's otherwise favourable position as an island country. Mr. Rice replied that he had received an order for five submarines, provided they could be built in England. I have no confirmation of the meeting referred to, but I was certainly told about the negotiations some years afterwards both by Mr. Albert Vickers and by Mr. Rice. The only document I have which confirms that the negotiations originated between the Admiralty and the American Company and not between the Admiralty and Vickers, is a letter from Mr. Rice to the Secretary of the Admiralty, dated 18th October, 1900, a copy of which is attached. It is a short letter, and I will read it.

The Secretary of the Admiralty,
Whitehall,
London, S.W.1.

18th October, 1900.

Sir,

Re Holland Sub-Marine Torpedo Boat.

Referring to the interview I had the honour of having with the Controller of the Navy on the 16th instant, when I requested permission to arrange for constructing the five Boats referred to in your favour of the 13th instant at the works of Messrs. Vickers Sons & Maxim, Ltd., and which permission you were good enough to give me, I have now to inform you that I have made all the necessary arrangements with this firm, and have authorised them to negotiate with you in regard to all details in connection with this business.

I have, furthermore, handed them your letter of the 13th instant for the purpose of replying to your various queries contained therein.

I have the honour to be,

Sir,

Your obedient Servant,

(Signed) ISAAC L. RICE,
President of the Holland
Torpedo Boat Company.

I have not the letter of the 13th October from the Admiralty to Mr. Rice. I am sorry, Sir, but I cannot find a copy anywhere (*reading*).

(2) During the Inquiry in Washington, Mr. Carse, the present president of the Electric Boat Company, who, perhaps, does not know the old history of the agreement between the Electric Boat Company and Vickers, is reported to have stated that "He believed the British Government had no knowledge of the agreements between

Vickers-Armstrongs and the Electric Boat Company, but the Electric Boat Company had advised the United States Navy Department of them." This evidence is incorrect. Paragraphs 7 and 11 of Admiralty letter to Vickers of the 13th December, 1900, prove that the Admiralty had full knowledge of the agreement between Vickers and the Electric Boat Company. In this letter the Admiralty offer Vickers the contract for the first five Holland submarines. In Vickers' letter to the Admiralty dated 27th October, 1900, they refer to their "rights of design, patents, etc., being respected during the terms the patents or any improvements thereon are in force," and enclose a list of patents which are the property of the Holland Torpedo Boat Company.

I have enclosed those letters in full.* There is nothing in them to hide, but they are very long and they are Admiralty documents. You have them before you. I will read them if you wish.

2301. *Chairman:* What is the date?

Sir Charles Craven: One is dated 27th October, 1900. Would you like me to read that?

2302. *Chairman:* Who is it from?

Sir Charles Craven: It is from Vickers, Sons & Maxim, Limited, to the Admiralty.

2303. *Professor Gutteridge:* It is headed "Strictly confidential"?

Sir Charles Craven: Yes. I have obtained permission from the Admiralty to use the document.

2304. *Chairman:* You might read this one because it is an indication of the type of correspondence that was passing.

Sir Charles Craven (reading):

Strictly Confidential.

The Secretary of the Admiralty,
Admiralty,

Whitehall, S.W.

Oct. 27th, 1900.

Sir,

Your letter of the 13th instant addressed to Mr. Isaac L. Rice has been handed to us to deal with, we having entered into an agreement with the Holland Torpedo Boat Company of America, for the exclusive manufacturing rights of boats under their patents, together with any improvements which they may make from time to time.

Furthermore, this agreement includes the manufacture for Her Majesty's Government of any boats required by them, and we have received from the Holland Torpedo Boat Company a guarantee that the conditions to be enumerated hereafter will be fulfilled by the boats supplied by us to Her Majesty's Government, and will be in every respect similar to the best submarine boat which is now under manufacture for the United States of America.

Our agreement also includes the service of an engineer who has had experience in the manufacture of boats in America, and also the use of a trained crew which will be at the service of the Admiralty for the purpose of instructing a British naval crew in the working and general operation of the boat under all circumstances of service.

The actual time for the manufacture of these boats is rather difficult for us to compute, as the drawings of the boat have not yet reached us, but they should do so in the course of a few days, but from experience in America, we are led to believe that we should have no difficulty in supplying the Government with the first boat about nine months after the signing of the contract.

The subsequent four boats would follow very quickly after the first boat, but, from the inter-

* See Appendix 19, p. 431.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

view our Director, Lieut. Dawson, had at the Admiralty, we understand that it would be the wishes of the Admiralty first to thoroughly test the first boat before finally completing the remaining four.

In regard to paragraph 2 of your letter, we, of course, shall make no objection to the trials taking place in an English port, as the boats, being built at Barrow, they can easily be sent round to any port you determine upon.

We note that facilities will be given in Her Majesty's Dockyards for carrying out at the Company's expense any work that may be necessary, after the arrival of the boats in England. This point should not arise, in consequence of the boats being built in England, but as it will be necessary for the trained crew to remain at the port during the carrying out of the trials and for the purpose of instruction we are prepared to agree that the cost of their maintenance and services shall be met by the Admiralty paying the actual cost only.

We think that this arrangement will be best suited to this particular case, as the services of the crew may be required for a short or a very prolonged period.

In regard to the conditions which our Company are prepared to undertake that the boat shall fulfil at the official acceptance trials, we submit for your consideration the following:—

2305. *Chairman*: I do not think you need read the remainder.*

Sir Charles Craven: No, it is purely historical.

2306. *Chairman*: It deals with the specification of the vessels?

Sir Charles Craven: Yes.

2307. *Chairman*: Will you go back to your statement?

Sir Charles Craven: (reading.)

(3) According to the early correspondence between the Admiralty and Vickers the construction of Submarines for the Admiralty commenced in the year 1900. By an Agreement of 17th May, 1902, between the Admiralty and Vickers the Admiralty agreed to confine Submarine construction to Vickers for five years, provided that Vickers did not build, design or sell to any other Government any Submarine Boat of any kind whatever before 1st April, 1909.

This Agreement of 17th May, 1902, was cancelled by a further Agreement dated 14th May, 1906, which again tied Vickers to the Admiralty for five years from 1st April, 1906, and precluded Vickers from foreign business for this five years and two years thereafter, except with the consent of the Admiralty. In this Agreement, however, the Admiralty only bound themselves to give us one half of the Submarines ordered, but agreed not to invite other Firms to compete provided Vickers could give satisfaction regarding deliveries.

(4) It will be seen that the closest possible liaison existed between the Admiralty and Vickers in connection with the construction of the "Holland" type submarine for the British Navy up to 1911. About that time, the Admiralty desired to consider other foreign designs and Scotts of Greenock made an arrangement with the Fiat San Giorgio Company, and Armstrong Whitworths with Schneider. Two or three submarines were built under this Agreement.

(5) Much has been made of the fact that profits are shared with the Electric Boat Company. To the best of my belief, the arrangement of profit sharing instead of payment of a fixed royalty in the original agreement with the Electric Boat Company was due to the fact that Vickers were not prepared to put down the necessary capital for the equipment of special shops and the provision of the necessary special jigs and tools for the production of a type of vessel the future of which was

in doubt. This capital expenditure was equally divided between the American Company and Vickers, and a division of profits reducing from two-thirds to the Electric Boat Company and one-third to Vickers down to 40 per cent. to the Electric Boat Company and 60 per cent. to Vickers was provided for in the agreements. A settlement of the Capital Account was made by a cash payment to the Electric Boat Company shortly after the Armistice, and the plant is now the property of Vickers-Armstrongs.

(6) In the year 1924, when Submarine construction appeared to be reviving for the British Navy on a modest scale, I approached Sir Trevor Dawson and told him how hard we were going to be bit by the Electric Boat Company agreement in that we should have to pay a proportion of our profits to the Electric Boat Company, and other British firms who had acquired all information during the War would not have to do so. I remember distinctly telling Sir Trevor Dawson that in my opinion the agreement should not be renewed when it automatically expired in 1927. Sir Trevor did not agree with me entirely, because he felt that owing to our old associations with the Electric Boat Company we should run a considerable commercial risk if we suddenly cancelled our agreement. Sir Trevor arranged for a representative to go to America and the result of the visit was a new agreement expiring on the 31st December, 1937. . . .

2308. *Chairman*: Is the new agreement the one to which I referred?

Sir Charles Craven: That is the one.

2309. *Chairman*: Of 1924?

Sir Charles Craven: Yes. (reading.)

. . . which provided for a royalty of 3 per cent. on British submarines built by us and a division of foreign business between the two companies. Much has been made of this carving up of the world into zones of operation, but it seems to me that the only reason for this arrangement was that the Electric Boat Company in the meantime had agreements with certain foreign countries and had associations with others, and, therefore, in some cases they could not agree to our interference. In others, such as Peru, for which country they had been building submarines in America, they did not feel disposed to give us a licence to compete with them.

(7) I wish to make it clear that in my opinion the "Holland" (U.S.A.) submarine was the first practicable submarine vessel produced in the world. I would go further and say that in 1914, when the American "H" boats were bought by the British Navy after assembly in Montreal, the design of these small submarines was then the best in the world.

(8) Particular reference has been made to certain letters of mine to Mr. Carse, the president of the Electric Boat Company, and Mr. Spear, a vice-president, who really carries out the duties of managing director. I should like to make it clear that I have known Mr. Spear intimately ever since I joined Vickers in 1912, and this accounts for the fact that my letters to him are written in a very free and friendly way. Naturally, had I known that such letters would be published, the wording would have been different, but there is nothing in the letters which will not bear close investigation, and practically every letter in my file was written with one object only and that was to impress on the Electric Boat Company the vital necessity of their reducing the 3 per cent. royalty paid on British submarines, in order that I could more satisfactorily compete with the British war-time builders, who had no such royalty to pay. The success of the efforts, which I have made in this direction, is evident when it is appreciated that in no case since the signature of the

* See Appendix 19, p. 431.

9 January, 1936.]

Commander Sir CHARLES W. CRAVEN, O.B.E., R.N.,
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

[Continued.]

new agreement has royalty in accordance with the agreed scale been paid on British submarines, but always some mutually agreed amount considerably less, thus enabling us to reduce the price quoted to the Admiralty.

(9) I am confident that at Barrow we can build submarines more cheaply, more quickly and more efficiently than any other builder in the country, and possibly in the world, but in order to place ourselves in this position we have spent very large sums of money since the War in equipping ourselves for this very special and difficult form of construction.

(10) During the periods of the agreements with the Electric Boat Company the closest possible relationship has existed between the two companies for the obvious reason that we wished to obtain all technical information from the Electric Boat Company. In no case has any secret information been divulged by Vickers to the Electric Boat Company, or vice versa.

Note.—It is of particular interest to note that for 13 years Vickers were precluded from building submarines for foreign navies.

2310. *Chairman*: This agreement apparently deals with what you call in your statement the Holland submarine?

Sir Charles Craven: Yes, that was the type; but the Holland Company became the Electric Boat Company.

2311. *Chairman*: Was that particular type of submarine protected by patent, or was it merely that they had the drawings?

Sir Charles Craven: No, Sir. At that time when they started they had had their vital master patents.

2312. *Chairman*: It was protected by patent?

Sir Charles Craven: Yes, very firmly in all countries of the world.

2313. *Chairman*: Then the effect would be that unless you made some agreement with them it would not be possible to build that type of submarine?

Sir Charles Craven: No.

2314. *Chairman*: When you say "no" you mean "yes"?

Sir Charles Craven: Yes. Similar arrangements were made with other foreign countries. For instance Dutch firms to-day are building under licence.

2315. *Chairman*: A great deal of correspondence passed between you and the officials of the Electric Boat Company. I do not want to trace it all through, but did the bulk of that correspondence have reference to this agreement and the terms of working under this agreement, or were there other matters referred to in the correspondence?

Sir Charles Craven: I do not think there was anything that I can remember that did not refer to the working of this agreement; but, as I say, it was done in a personal way.

2316. *Chairman*: I am not referring to the terms that you used or the language that you used, but to the subject-matter of the documents.

Sir Charles Craven: I cannot remember anything else.

2317. *Sir Philip Gibbs*: I think we may be able to refresh your memory a little, Sir Charles.

Sir Charles Craven: Be it so. I cannot think of anything.

2318. *Chairman*: I want to refer to certain of the letters in the same Part at page 332. There is a letter dated 30th July, 1932:—

H. R. Carse, Esq.,

The Electric Boat Company,
40, Wall Street, New York.

My Dear Mr. Carse,

Very many thanks for your telegram which, being decoded, reads as follows:

"Referring to your telegram of the 25th and to your letter of the 18th ultimo, the directors will

accept £10,000 settlement of 'Thames', 'Porpoise' 'S' engines, also agree to £7,500 'Thames', £3,000 'S' boat tender(s). Stop. We cannot now decide about possible business next March."

First may I suggest that even in code it is better not to mention any names of ships, as I am rather afraid that such telegrams might get into the hands of our clients.

To whom were you referring as "our clients"; do you remember?

Sir Charles Craven: I suppose it must have been the Admiralty. I cannot see much point in it. I was writing to an American trying to stop him sending telegrams and letters mentioning His Majesty's ships. It is never done by anybody—not by telegram at any rate—and I think I was trying to emphasise the desirability of his not doing so. That is all. But it is quite possible—it was certainly published by the Admiralty months before this—that that ship might not then have been christened. I cannot say.

2319. *Chairman*: Mr. Arnold-Forster suggests that inquiry should be made as to whether royalties paid by Vickers to the Electric Boat Co. were disclosed to the British Admiralty. It is quite clear from your correspondence that the agreement was disclosed to the Admiralty, but were the terms of it disclosed to them indicating that these royalties were payable, or paid?

Sir Charles Craven: I cannot tell you. I do not know. As to whether they saw the agreement—I do not think they would see the agreement.

2320. *Chairman*: But they knew it existed?

Sir Charles Craven: They must have known it existed.

2321. *Professor Gutteridge*: They must have known that you would be paying royalties?

Sir Charles Craven: Yes. I want to make it clear there was no collaboration at the time with regard to the price of these vessels. We were in strict competition with the builders and any royalties were paid out of our pocket.

2322. *Chairman*: But they knew there was an agreement and they knew it was an agreement enabling you to do so?

Sir Charles Craven: Yes.

2323. *Chairman*: Therefore, they knew you must have been paying patent royalties.

Sir Charles Craven: I do not know whether they knew in regard to the 1924 agreement, the terms being a flat rate—

2324. *Professor Gutteridge*: It would not affect them?

Sir Charles Craven: I do not think so.

2325. *Dame Rachel Crody*: But you did say in that letter that "it would be awkward if our clients asked me about it"?

Sir Charles Craven: I know. I do not know why I told them that, unless I was trying to impress upon people in America not to write silly letters.

2326. *Professor Gutteridge*: I suppose the Admiralty would not agree to have a telegram sent *en clair*?

Sir Charles Craven: I think they would dislike it very much.

2327. *Chairman*: In the same Part, page 195, there is a letter which has been referred to a great deal, with reference to your trying to ginger up the Chileans to take three more boats. I think you explained that to us yesterday. That is Exhibit 124.

Sir Charles Craven: There were six and a depot ship and we built three and a depot ship. I think actually it was the depot ship they were short of cash for. There were two separate contracts. We built the depot ship and three and the original scheme was for a depot ship and six.

Mr. Yapp: It is true that we built only three submarines out of their original programme of six.

2328. *Chairman*: At page 431 there is a letter, Exhibit 162?

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: Referring to a Portuguese tender?

2329. *Chairman:* Yes. Mr. Arnold-Forster in his evidence suggests that the reference to arrangements with Hawthorn Leslie's and Thornycroft's calls for explanation. What does that refer to? Does it mean a standing arrangement or a special agreement?

Sir Charles Craven: It was a special arrangement. It was quite a large naval programme for a country of the size of Portugal, including submarines, and at that time an aircraft carrier, destroyers, sloops and so on. Some of these were to be built in Portugal and some abroad. At that time when the inquiry was issued they wanted rather long-dated payments. Portugal was not then in quite the same wonderful position that she is to-day, so we formed a team of what we thought were the three strongest British firms at that time and we tendered competitively for certain products in which we specialised. Thornycroft's tendered for destroyers and Hawthorn Leslie's for sloops. It was not quite a joint tender, we were three separate firms, but we were a team. We were in competition not only with the continent but with other British firms.

2330. *Professor Gutteridge:* Were Yarrow's in?

Sir Charles Craven: Yarrow's, unfortunately, got the contract for the destroyers. Our team partly failed, but we got the armament, submarines and sloops. May I supplement that by saying that when we are in competition with a country like Italy our one firm is in competition with the whole of the Italian shipbuilding industry? This was a miniature attempt to bring the most efficient group together to try and knock out the foreigner.

2331. *Professor Gutteridge:* I suppose in the case of a country like Portugal there is a certain advantage in having their warships built by a British firm, in a friendly country.

Sir Charles Craven: You mean from the national point of view?

2332. *Professor Gutteridge:* From the national point of view.

Sir Charles Craven: I think there is every advantage.

2333. *Chairman:* The last reference in this document—Exhibit 84 (Part I, page 375)—deals with the export of arms to Peru in 1934. It is in regard to 1,200 rounds of 3-inch ammunition for 50,000 dollars shipped to Para.

Sir Charles Craven: I will ask Mr. Yapp to deal with that if he does not mind.

2334. *Chairman:* What is suggested in reference to this licensing question is that you should be asked under what licence that shipment was made.

Mr. Yapp: The ordinary Board of Trade export licence.

2335. *Chairman:* Was that the open one?

Mr. Yapp: No, a special application was made disclosing fully the material to be shipped and a licence was granted.

2336. *Chairman:* Did the licence indicate what the article was?

Mr. Yapp: Yes.

2337. *Dame Rachel Crowdy:* To where were you licensed to ship? It would appear that when there was tension between Peru and Colombia, Vickers supplied 1,200 rounds of 3-inch ammunition for 50,000 dollars. It was shipped to Para in Brazil, then from Para to the West Indies, and from the West Indies handed over to a Peruvian ship. It was part of a contract by which the Electric Boat Company was delivering two gunboats to Peru. I should be extremely interested to know to where the licence was issued.

Mr. Yapp: The original export licence stated the ultimate destination as being Peru via a South American port. There were changes in the place of delivery before the stuff was shipped. The material was finally shipped to Kingston, addressed to the captain of a Peruvian vessel, after the Foreign Office, at our request, had obtained through the Colonial Office permission from the Government of Jamaica for trans-shipment.

2338. *Professor Gutteridge:* As a matter of fact, I suppose it was finally destined for Iquitos?

Mr. Yapp: Yes.

2339. *Professor Gutteridge:* And then they changed their minds.

Mr. Yapp: Yes.

2340. *Professor Gutteridge:* The fighting was on the upper reaches of the Amazon.

Mr. Yapp: The instructions for shipment we got from the Electric Boat Company.

2341. *Professor Gutteridge:* To send them up the Amazon?

Mr. Yapp: Yes. That is what happened and the final method of delivery was made quite clear to the British Government, who knew all about it.

2342. *Dame Rachel Crowdy:* They knew about this method of trans-shipment?

Mr. Yapp: Yes.

2343. *Dame Rachel Crowdy:* That is interesting to me, because it is similar to some of the illicit transactions in the opium traffic, where opium is shipped to one port and then trans-shipped to another.

Mr. Yapp: The material was finally handed over to a Peruvian vessel.

2344. *Chairman:* I would like to ask a question about what we call in this country bribery. I do not know whether you have the report of our Proceedings containing the evidence of Mr. Walton Newbold. I want to refer to page 142, Fifth Day.

747. *Dame Rachel Crowdy:* First of all I should like to go back to a question which the Chairman has just asked, to ask Mr. Newbold if he would define to us what he considers comes under the heading of a bribe or bribery.

Mr. Walton Newbold: I consider that that is a matter which varies with the standard of morality of the country in which business is being done and the standard of morality of the people doing business. I can conceive that business methods in the country of Ruritania in South-Eastern Europe, which I visited some years ago in a semi-official capacity, are very much different, seeing that the editor of their chief economic paper followed me to the railway station and followed me along the platform at the railway station, pointing out that it would not be possible for us to get any contracts in Ruritania unless we were prepared to grease the officials and the people placing the contracts. I should imagine, knowing the United States pretty well at any rate, and having seen something of the conditions under which public works contracts were being given out in 1933, that they have a very much more liberal interpretation of what constitutes a fair business practice than would be accepted in a British court of law, let alone in leading Nonconformist circles in this country. More than that I should not like to say; and the question then arises as to how far a big employer of labour in this country is to forego export trade, or how far he is to forego his principles. After all, practically all commerce carried on outside of the few countries in North-Western and Central Europe is characterised by what would be called in this country grave irregularities, and I think we are face to face with this problem of how far we can retain our foreign markets if we are to resort to Christian or to legal practices. I think it is impossible to define—

* See also oral evidence before U.S. Senate Committee, Part I, pp. 156-7.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

748. Sir Philip Gibbs: Are you in favour of bribery?

Mr. Walton Newbold: No, of course I am not.

749. Sir Philip Gibbs: You seem to suggest it.

Mr. Walton Newbold: No, I do not. I merely try to face up to the facts of life.

I want to know from your experience of your companies whether the condition of things which Mr. Walton Newbold there describes is general, in reference to trading in those particular countries with regard to large contracts—not merely armaments contracts but industrial contracts.

Sir Charles Craven: That is a difficult thing to answer, but I should say roughly that the further you get away from here the looser are the business morals.

2345. Chairman: I want to know not only as a matter of morality but as a matter of law. In those countries to which Mr. Walton Newbold is alluding, is there a law corresponding to our law with reference to bribery, or is it looked upon as a matter of course against which there is no legislation? Do you know that?

Sir Charles Craven: I could not tell you, Sir, but I do know this, that, when this American Inquiry started, a lot of countries had investigations as to whether the charges that had been put up against certain of their officials could be proven and they all decided they could not. I remember two or three of the South American countries did. I do not know the law, Sir. I know that it is very wide in this country.

2346. Professor Gutteridge: Have you any doubt in your mind that a good deal of it goes on?

Sir Charles Craven: It is only what I think; it is not what I know. I do not think that any goes on to create armaments.

2347. Professor Gutteridge: As you have said, the further you get away from this part of the world, the more likely you are to meet with it, broadly speaking.

Sir Charles Craven: Yes. I do not think in the armament industry—about which I know more than I do of other industries—anything is done to create a demand for armaments. I think if it is done it is a question of one firm trying to get business away from another.

2348. Dame Rachel Croody: When you say that the further you get away from this country the looser are the morals in that connection, do you mean the looser the morals of the briber, or of the bribee? Because that is quite a different thing.

Sir Charles Craven: I really do not know. I am thinking of the country you are living in.

2349. Chairman: It is useless to be a briber unless the bribee accepts the bribe.

Sir Charles Craven: The briber might be a native of that country. It is quite likely he would be.

2350. Chairman: Do I understand that, whatever the facts may be with regard to this particular matter, it is quite clear that if any of your agents do anything of this kind, they pay for it out of their commission?

Sir Charles Craven: Yes.

2351. Chairman: There is nothing extra paid by your firm beyond commission. The agreement provides that they are paid on commission and if they make any other payment they do so out of their commission.

Sir Charles Craven: Yes. They do it out of the 3.4 per cent. That is the average selling expense of the foreign armament business.

2352. Professor Gutteridge: I suppose you issue no instructions one way or the other on such questions.

Mr. Yapp: No, we do not.

Sir Charles Craven: The Commission may be interested to know that quite recently we were trying to get a very large foreign contract. A

mysterious person said that he had very large influence and that if we gave him x per cent. he could, through his influence get us a contract. We told him that we did not want anything to do with him—and we got the contract. I do not know whether that is bribery. He had nothing to do with it. He was a friend—so he said—of the buyers, but at any rate we did not do it, and we got the contract.

2353. Professor Gutteridge: I think sometimes it is regarded as a remuneration for services rendered. That is to say, you go to somebody who is a friend of the Minister of Marine—generally a lady—and you make an appeal to her and pay her something to use her influence with the Minister of Marine in that country. That is the sort of thing that happens. It is not quite the same thing as bribery.

Sir Charles Craven: I accept your standard of morality, Sir.

2354. Professor Gutteridge: These sorts of things are lumped together, and I think very often when people talk about bribery that is what they mean. There are people who, in the Italian language, are called "Affaristi." They are people who go round government offices using their influence. In the torpedo trade, I have been told, at one time there was a lot of that sort of thing went on. Now I do not know whether I ought to put questions with regard to your alleged international ramifications to you or to someone else, Sir Charles.

Sir Charles Craven: One of us will answer, Sir.

2355. Professor Gutteridge: It has been suggested, you know, that there is a kind of arrangement of interlocking directorates by which you are in some way or other connected with Skoda and Schneider. In that connection two companies have been mentioned—the Anglo-International Bank and the British and Allied Investment Corporation. Are you interested in those two companies as a firm?

Mr. Reid Young: In the Anglo-International Bank, as Sir Herbert Lawrence explained yesterday, we did hold shares, and we still hold some shares in that company. Sir Herbert was chairman of the bank up to last year. But beyond having an investment in the company it has no interest in our affairs and we have no interest in it in any shape or form. The company was formed out of a committee that was appointed, in 1920 I think, by the Board of Trade to recommend methods for assisting British manufacturers to do business on the continent after the War. It was, I think, formed in the nature of a finance company or a banking house of some kind and the Metropolitan Carriage Company, which we subsequently bought up, and Vickers took a certain interest in this proposal, as a result of which we acquired certain shares of the trade corporation.

2356. Professor Gutteridge: You went into it with the knowledge of the British Government?

Mr. Reid Young: It was on the recommendation of the British Government. That company got into difficulties, and about 1926 it was amalgamated with a company called the Anglo-Austrian Bank, which was a company of the same nature, for assisting British manufacturers to do foreign business. That was amalgamated into the Anglo-International Bank. We still hold some shares in that company, but, as I say, it takes no interest in our affairs.

2357. Professor Gutteridge: What about the British and Allied Investment Corporation? Is that a similar concern?

Mr. Reid Young: No. That was an English finance house, of which Mr. Carter was a director. He came into touch with us when we started to take an interest in the Darlington Forge. He was a director of the Darlington Forge at that time. He acted as an intermediary with regard to the purchase of the shares of the Darlington Forge by Vickers and he remained on the board of the Darlington Forge for some six months afterwards.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N.,
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT MCLEAN and Mr. A. DUNBAR.

[Continued.]

Eventually, when we got complete control of the Darlington Forge, Mr. Carter resigned from the board. Beyond that he had no connection with Vickers in any shape or form.

Sir Charles Craven: He was the representative of Skoda in England.

2353. *Professor Gutteridge:* I am not sure that that is not where the sting, if there be a sting, lies. It has been suggested that Skoda were interested in the British and Allied Investment Corporation.

Mr. Reid Young: Mr. Carter was the representative in England of Skoda.

2359. *Professor Gutteridge:* So to that extent he did put you in touch possibly with Skoda?

Mr. Reid Young: He did not in fact.

2360. *Professor Gutteridge:* It is also alleged that you got in touch with Schneiders through the other company?

Mr. Reid Young: The Polish company?

2361. *Professor Gutteridge:* Yes. Were Schneiders shareholders in that company?

Mr. Reid Young: Yes, at the invitation of the Polish Government—Schneiders and Vickers.

2362. *Professor Gutteridge:* How did the Polish Government come into touch with them?

Mr. Reid Young: The Polish Government after the War decided to set up an arsenal or establishment for the manufacture of munitions and they asked Schneiders and Vickers to advise.

2363. *Professor Gutteridge:* Somebody yesterday told me—I think it was Sir Herbert—that there never was any working arrangement either with Skoda or Schneider or any German firm. I just want to ask you a question about your submarine business. I notice somewhere or other reference is made to one of your catalogues or trade lists. This is in the Union of Democratic Control's evidence, page 141, second column. Perhaps you would turn that up and then you will have the entry in front of you. There is an extract given there from one of your lists in which you state that you are

in the unique position of possessing the world patent rights of all the useful modern developments in connection with submarines, mines, depth charges, and paravanes.

Sir Charles Craven: "Submarine mines," not "submarines."

2364. *Professor Gutteridge:* "Submarine mines" is it?

Sir Charles Craven: I imagine so. It is not true with regard to submarines. I have not the advertisement.

2365. *Professor Gutteridge:* It may be my transcript that is wrong.

Sir Charles Craven: I think this is either a misprint of the evidence or the evidence was untrue.

2366. *Professor Gutteridge:* Then the print here is wrong, is it?

Sir Charles Craven: Either the print is wrong or the evidence is wrong.

Mr. Yapp: They put a comma after "submarines." It should be "submarine mines."

2367. *Professor Gutteridge:* You can easily verify that.

Sir Charles Craven: Yes, from one of our advertisements. It is definitely incorrect.

2368. *Professor Gutteridge:* I do not know that that necessarily excludes my question, because if that is so, if you hold the master patents for a lot of these things, they can only be manufactured abroad with your consent. The Germans could not make any paravanes without coming to some arrangement with you.

Mr. Yapp: Not unless they infringed our patents.

2369. *Professor Gutteridge:* As regards mines, does it necessarily follow that if a submarine mine is made, or depth charges are manufactured, your patents come into the matter?

Sir Charles Craven: We think ours are very very good, Sir. There are other patents, of course.

2370. *Professor Gutteridge:* Are there any agreements relating to submarine mines and depth charges with any other firms?

Sir Charles Craven: In France we have a license, and in Holland, and in Spain—our Spanish company, of course. They are all returned to you in the return which we have made.

2371. *Professor Gutteridge:* We shall find them in that appendix?

Sir Charles Craven: Yes, quite so. It is Appendix No. 7.* I think.

2372. *Professor Gutteridge:* Now I want to pass on to something else. One of the suggestions that is made against you is that you and other firms from time to time put your heads together in order to put up the price against our own Government. I think your answer to that is No, definitely, and I think you have explained to us why that is impossible. That is so, is it not? I do not want you to go over the points which you have already dealt with.

Sir Charles Craven: I am not saying there is no collaboration between the firms who are tendering to the Government.

2373. *Professor Gutteridge:* But is there a deliberate conspiracy to put up the prices? That is what is alleged against you. You have the evidence before you.

Sir Charles Craven: "Ganging up" I think is the expression, Sir.

2374. *Professor Gutteridge:* Let us look at page 330 in the first volume of the American report. Have you that before you?

Sir Charles Craven: Yes, Sir.

2375. *Professor Gutteridge:* That is one of the letters which has been used against you. It is a letter of the 7th October, 1927—Exhibit No. 18.

2376. *Professor Gutteridge:* There are several questions which arise out of that letter. I do not know whether it is worth while reading the letter.

Sir Charles Craven: This is a letter which I referred to yesterday, which was quoted in my letter to the First Lord of the Admiralty. It was published this morning, I think.

2377. *Professor Gutteridge:* You explained yesterday, I think, the question of the three boats, and I understood you to say that just at that moment you were thinking of amalgamating with Armstrongs?

Sir Charles Craven: Yes.

2378. *Professor Gutteridge:* And it would have been very awkward if there had been a rival tender and therefore you got Armstrongs to put in a dummy tender, if I might call it so.

Sir Charles Craven: It was not quite that. There were six boats to be built, and I put in a price for Armstrongs higher than the one for Barrow. There were six boats to be built, and I did not want them to be built at Newcastle, because we knew we could build them cheaper at Barrow; but the difference in cost between the two ordinary estimators was very large—I mean the ordinary independent estimators.

2379. *Professor Gutteridge:* What do you mean by the independent estimators?

Sir Charles Craven: The estimators of Vickers and of Armstrong-Whitworths. I had not at that time taken over the joint managing directorship, and the difference was £40,000, or something of that sort.

2380. *Professor Gutteridge:* You were, in fact, the only people in it?

Sir Charles Craven: Oh, no, Sir. There were other firms.

2381. *Professor Gutteridge:* Perhaps we might have that later on.

Sir Charles Craven: There was a difference of 13 per cent. in their estimated cost of production at Newcastle, and Barrow's estimated cost.

* Not printed.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

2382. *Professor Gutteridge*: You mean you could build 13 per cent. cheaper at Barrow?

Sir Charles Craven: Yes, and now that we have combined the two firms we do build them all at Barrow.

2383. *Professor Gutteridge*: This letter has also been taken as suggesting that there was leakage from the Admiralty which reached you in an unauthorised manner. You will notice it at the end of the first paragraph. It says: *I have had a word with the Director of Contracts at the Admiralty, who is a friend of mine, and who would like this. He, I know, tried to get us the order for all five submarines last year; and then in the last paragraph but one you say: I have not yet procured a definite list of the firms who have been asked to tender this time, but I am told the same lot are in*”; and it is suggested that you had some roundabout way, as I understand it, of getting information from the Admiralty.

Sir Charles Craven: As to who was tendering, Sir?

2384. *Professor Gutteridge*: Yes.

Sir Charles Craven: But anybody can find out about that.

2385. *Professor Gutteridge*: There is no secrecy about that at all?

Sir Charles Craven: No.

2386. *Professor Gutteridge*: I suppose the detail is secret?

Sir Charles Craven: The tender goes in to the Admiralty in a sealed envelope, and we all think that is absolutely watertight.

2387. *Professor Gutteridge*: But would you go to the Admiralty and ask for the information?

Sir Charles Craven: I should have no compunction in going to the Admiralty and asking if so and so was tendering. I was not concerned with it at this time, but I should have now no compunction in going to the Director of Contracts, or to the people concerned at the Admiralty.

2388. *Professor Gutteridge*: It was not merely because you were *persona grata* at the Admiralty? I think that was the suggestion?

Sir Charles Craven: Not at all. But the other point I think is more serious, about the Director of Contracts. He is a head of a department. He does not place orders, but he writes a letter which is signed by him, and the Committee places the order. The only reason why he wanted us to do it was that it was a saving to the Crown by doing it that way.

2389. *Professor Gutteridge*: It was cheaper that way?

Sir Charles Craven: Yes; he could have got them cheaper that way.

2390. *Professor Gutteridge*: Then on the next page in the letter of 30th November, 1927 (Exhibit No. 19), you speak of being in a position of looking after Armstrongs and keeping them out of the picture?

Sir Charles Craven: There I am referring to the amalgamation.

2391. *Professor Gutteridge*: That is the amalgamation, and I do not think we need pursue that.

Now may I turn to another letter on page 406, which has also been stated to affect you. It is Exhibit No. 125, and in the last paragraph you say: *By skilful manoeuvring we have managed to get some of our competitors' prices in the Chilean competition put up, and so may have prevented a real price-cutting war which would have resulted in our taking the boats at a loss. That, of course, refers to competition abroad in a foreign country?*

Sir Charles Craven: Yes, these were the submarines for Chile. The first three were delivered.

2392. *Professor Gutteridge*: But who would be your competitors in this particular case?

Sir Charles Craven: Cammell Lairds of Birkenhead would be the firm. There is a very simple explanation of it.

2393. *Professor Gutteridge*: Then perhaps you will give it to us, will you?

Sir Charles Craven: Our agents cabled to us and told us that Cammell Lairds had quoted a price for the submarines which was ridiculously low. They had not built this particular type of submarine, and in view of the position, I went to the then managing director of my company—Sir Trevor Dawson—and explained the circumstances. As a result we went together to the chairman of Cammell Lairds and told him that we had been informed they had put in a price which we, in our experience, having already built this type, knew to be much below what they would cost. He informed us that they had quoted this price because their agent informed them that our tender was round about the same figure, and they (Cammell Lairds) thought that if that price was good enough for us, it was good enough for them. The price cabled to them by their agent was about £50,000 below our price.

2394. *Professor Gutteridge*: You mean you saved him from making a very bad mistake?

Sir Charles Craven: Yes. He withdrew his tender immediately.

2395. *Professor Gutteridge*: Then you go on to say something else in the same connection?

Sir Charles Craven: Is that in the same letter?

2396. *Professor Gutteridge*: No. That is about the British tenders. That is simply about the geographical spread of work.

Sir Charles Craven: It was comparable then with the position as it is to-day in the shipbuilding industry. It was even worse then, but I do not think it matters to our case. If I put in a tender for a whole flotilla of submarines to be delivered, it would not make any difference although I think you will remember that in the First Lord's letter prices were the first consideration, and we have to take that into calculation.

2397. *Professor Gutteridge*: In one of these letters—I do not think you say it, but somebody else says that the result of friendly competition would give compensation to the loser?

Sir Charles Craven: Yes, I think that is said somewhere.

2398. *Professor Gutteridge*: I do not know where it came from, but the phrase stuck in my memory—“friendly competition with compensation to the loser”. What is the idea of that?

Sir Charles Craven: The loser would get something for all the trouble he had taken in preparing estimates and tenders, and so on.

2399. *Professor Gutteridge*: Is that genuine competition, or not?

Sir Charles Craven: It might be, or it might not; but it is quite possible that two firms would send their commercial and technical experts to a foreign country to provide for, say, a submarine.

2400. *Mr. Spender*: Who would the loser receive compensation from?

Sir Charles Craven: From the winner, if he got it, Sir—if he got it.

2401. *Professor Gutteridge*: I find it a little difficult to appreciate how it can be genuine competition. I think you told me it was?

Sir Charles Craven: I say it might be, but it might not be.

2402. *Professor Gutteridge*: How could it ever be genuine competition?

Sir Charles Craven: If I were tendering for a vessel, and were to put in £1,000 to cover tendering expenses—

2403. *Professor Gutteridge*: You will never persuade me, as long as I live, that that is genuine competition.

Sir Charles Craven: It is genuine competition with each other.

2404. *Professor Gutteridge*: Well, I do not know in what sense you use the word “competition”.

Dame Rachel Crawdy: Arranged competition?

Sir Charles Craven: No, we should not know each other's prices. You would not see my tender, but if I got an order I might pay you such a sum of money as would recompense you for the expense

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNNAN.

you had undertaken in sending out people to make the tender and the estimate.

2405. *Chairman*: It is like a boxing match; there is a purse for the loser?

Sir Charles Craven: No. It is a matter of business; it is not a matter of courtesy.

2406. *Professor Gutteridge*: It is quite news to me that business men competing with one another are so good to each other.

Sir Charles Craven: After all, this is not one of my letters.

2407. *Professor Gutteridge*: No, that is quite true, and therefore I will not pursue it. If you will look at page 399, Exhibit 115, there is a letter written by Mr. Spear the vice-president of the Electric Boat Company, to Mr. Carse, and he speaks of a Commander Aubry who, I think, was a Peruvian officer?

Sir Charles Craven: Yes.

2408. *Professor Gutteridge*: And right at the beginning of the letter it says that this gentleman is planning to sail for Buenos Aires, and then Mr. Spear goes on to say: *We want him to stay in the Argentine long enough to give us full reports and to receive and carry out instructions from us. I have advised him in a general way that it may be our policy to support the bid of our English friends in the Argentine and that we may also decide to have a friendly controlled bid put in from Italy. Is that a similar sort of arrangement?*

Sir Charles Craven: I could not really say. That is from a member of the staff of a foreign company to his boss.

2409. *Professor Gutteridge*: But who are the English friends?

Sir Charles Craven: We should be his English friends. We are the English people entitled to speak for him.

2410. *Professor Gutteridge*: Can you remember that episode at all, or can Mr. Yapp?

Mr. Yapp: I cannot remember it.

Sir Charles Craven: The submarine was built in Italy; that is all I can remember.

2411. *Professor Gutteridge*: Did you not get the order?

Sir Charles Craven: No, I do not think we were allowed to tender. It is one of the Electric Boat Company's countries. We had not the local rights in the Argentine.

2412. *Professor Gutteridge*: I come to a more serious matter now, and I do not think you have been asked about this. It is on page 406, Exhibit No. 120, where you speak of the appointment of a gentleman called Percy Addison as director of dockyards, and you use these words in writing to Mr. Spear: *I wonder whether you have heard that our old friend Percy Addison is now the director of dockyards. I helped him all I could to get the job, and I think he will be an ideal fellow for it. It means his retirement, but it also means his having a permanent job for about ten years if he behaves himself. I do not know if that means if he behaves himself vis-a-vis the Admiralty, does it?*

Sir Charles Craven: Yes.

2413. *Professor Gutteridge*:—and as he has no private means worth talking about, you will appreciate what this means to him. I have suggested to him that you and I, and he and Johns (who is anxious to meet you), should have a party and thoroughly wet the appointment. Now, that letter has been used to suggest that there was some sinister arrangement between you.

Sir Charles Craven: Well, Sir, as regards the director of dockyards, I hope you will ask the government witnesses about this.

2414. *Professor Gutteridge*: But perhaps you had better give us your own version about it.

Sir Charles Craven: The director of dockyards does not buy a pennyworth from Vickers, or anybody connected with us, as far as I know. I was in submarines with Admiral Sir Percy Addison

in 1905, and we served together in the War, and he has been one of my greatest personal friends ever since; and when this job was going to be offered to him I gave him every commercial help that I could to qualify him to take over what is, in effect, a very big managing director's job.

2415. *Professor Gutteridge*: You mean you helped him to acquire the necessary technical knowledge?

Sir Charles Craven: Yes. He came to me and stayed with me in Barrow, and I did what I could to help him.

2416. *Professor Gutteridge*: You gave him a kind of training?

Sir Charles Craven: Yes, a sort of general idea of administration, which does not ordinarily come in the way of an admiral, to enable him to run a concern like his. He may be employing nearly 40,000 men to-day. But as regards buying from me, the director of dockyards cannot buy anything.

2417. *Professor Gutteridge*: Was it because he was a friend of both of you?

Sir Charles Craven: Yes. He and Spear went out in a submarine together in 1907, for diving exercises, he being an inspector for the Admiralty. But to suggest that there were any improper relations between me and Addison—well, anybody has got a very dirty mind who makes that suggestion.

2418. *Chairman*: The director cannot buy, but from a business point of view it is just as well to be friendly?

Sir Charles Craven: Yes, and from time to time we help each other now. When I started one of the modern cruisers, which have a great deal of welding in them, we had a great deal of consultation on it, and I am sure it is as much in the interests of the country as it is to my company.

2419. *Professor Gutteridge*: I quite agree. You have built some very big steamers at Barrow?

Sir Charles Craven: Yes.

2420. *Professor Gutteridge*: Some of the Orient liners were built there?

Sir Charles Craven: Five out of the six.

2421. *Professor Gutteridge*: May I ask a question arising out of that, or ought it to be addressed to somebody else? It was suggested by Mr. Noel Baker in the course of his evidence that when a man becomes an armament worker he is an armament worker and nothing else, and therefore if a firm which employs him stops making armaments, that man loses his job; he is no use for commercial work. Is that so?

Sir Charles Craven: Absolute rubbish.

2422. *Professor Gutteridge*: You mean you can turn a worker of that kind on to ordinary commercial work?

Sir Charles Craven: Yes, of a high class. We did try to do it with all kinds of industries after the War. It is possible to do it in the case of high class industries such as a passenger ship, as against a cruiser. There there is complete interchange.

2423. *Professor Gutteridge*: Could you tell me this. Do you keep a man working on armaments all the time, or do you shift him about between armaments and commercial work?

Sir Charles Craven: Generally speaking, on the armament work, if possible on the same run of work we should have the same man, say on gun mountings, right through the piece, or in submarine engine construction. We should try to keep them at it. But those are the very men whom we should not lose if things got bad in their particular industry.

2424. *Professor Gutteridge*: I suppose the majority of your men enter as apprentices?

Sir Charles Craven: Yes.

2425. *Professor Gutteridge*: And they are the sons of armament workers, are they not?

Sir Charles Craven: They are the sons of our workers in many cases. In some of the Tyneside works I obviously could not say that that is always

9 January, 1936.]

Commander Sir CHARLES W. CRAVEN, O.B.E., R.N.,

[Continued.]

Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

so, because there are such a lot of other works on the river.

2426. *Professor Gutteridge*: I think possibly Mr. Reid Young could tell me this. I should like to know exactly what you mean by a finance company. The Broadway Finance Company, one of the companies which you mention, is a case in point.

Mr. Reid Young: The Broadway Finance Company was formed out of a company which was during the War a manufacturing company. We sold the business of that company after the War, but retained certain debts due to the company which had to be liquidated. We could not carry on the company under the name under which it was trading when it was manufacturing, so we took over certain of the assets of the manufacturing company and called it the Broadway Finance Company.

2427. *Professor Gutteridge*: It was a kind of dust-bin for bad debts, really?

Mr. Reid Young: Yes, and certain transactions such as the purchase of the Darlington shares were transacted through the Finance Company.

2428. *Professor Gutteridge*: When you speak of a finance company, it is a company which does not manufacture?

Mr. Reid Young: Yes. We use the expression to mean a finance company as distinct from a manufacturing company.

2429. *Chairman*: I wanted to ask something arising out of what the Professor has asked, but which you did not answer. He asked you as to whether you were accused of conspiring to raise prices.

Sir Charles Craven: Yes.

2430. *Chairman*: And you seemed to have some little difficulty in dealing with that matter, because I suppose the natural effect of all these associations that have been referred to—the object, partly, of the associations, and the effect of the associations—is in combination with other firms either to maintain prices or to raise prices?

Sir Charles Craven: Yes.

2431. *Chairman*: “Conspiracy” would not be the appropriate word with regard to that, but the avowed object of these associations is either to maintain or to raise prices?

Sir Charles Craven: Exactly what is happening in the coal trade to-day. We are exactly the same.

2432. *Chairman*: I only wanted you to explain the position. I saw you were in a difficulty in answering the question with regard to conspiracy.

Sir Charles Craven: Yes.

2433. *Professor Gutteridge*: I really ought not to have used the word “conspiracy”. I was really trying to convey in a picturesque way the sort of allegation that was being made against Sir Charles.

2434. *Sir Philip Gibbs*: I wanted to ask you a few further questions about your methods in your foreign export trade. There has been some laughter in court, quite justified, and some suggestions that ordinary business methods in certain foreign countries involve a certain amount of palm oil and bribery, and so on; and it seemed to be accepted both by you and by Mr. Reid Young and by Sir Herbert Lawrence that that was so. I think a distinction ought to be made on that point between the methods of ordinary commercial businesses and your own business, and I would like to ask you first of all whether you regard your particular business as a dangerous trade?

Sir Charles Craven: No, not while properly managed by ourselves and properly controlled by our country.

2435. *Sir Philip Gibbs*: You do not think, for instance, that your wares are any more dangerous or noxious than, we will say, boxes of chocolates, or sugar candy?

Sir Charles Craven: Or novels, no.

2436. *Sir Philip Gibbs*: Well, we will say not more dangerous than pig iron that is to be turned into ploughs and harvesters.

Sir Charles Craven: If the business is honestly managed, and properly managed, and properly controlled by the home country, no.

2437. *Sir Philip Gibbs*: You do not think, for instance, that any of these fancy things which you export to these other countries are likely to be more dangerous than children's Christmas crackers?

Sir Charles Craven: Is that really a question that is intelligent, or requires an intelligent answer, Sir?

2438. *Chairman*: If you can answer it, you had better answer.

Sir Charles Craven: I once nearly lost an eye with a Christmas cracker, and I have never lost one with a gun.

2439. *Sir Philip Gibbs*: That seems to be rather reassuring to the peoples of Europe; but these questions, which seem rather trivial, and which I have put in a light way, really go rather deep into the question which we have to consider; because I want to put it to you that the continual expansion of arms by your export trade abroad might have very unpleasant effects in the world. Do you agree with that at all?

Sir Charles Craven: I do not consider that by so exporting arms we are increasing the consumption of arms at all.

2440. *Sir Philip Gibbs*: You do not?

Sir Charles Craven: No.

2441. *Chairman*: I think that has been generally agreed up to now. If you were to stop exporting arms, I think the evidence up to the present is that it would not diminish the supply. The demand would be supplied by somebody else?

Sir Charles Craven: That is my opinion.

2442. *Sir Philip Gibbs*: I should like to suggest in a friendly way that your own activities really have rather increased the potential weapons of slaughter in the world. For instance, on page 194 of the American evidence, one of the American Commissioners appointed to inquire into this business of arms traffic, and so on, said that Sir Charles Craven was a pretty good trader, and Mr. Carse, who is a friend of yours, said “Oh yes.” Then Senator Clark said: “He would not be holding that job with Vickers if he was not,” and Mr. Carse said: “Yes, that was his job.” I must say, in a most friendly way, reading all your correspondence as published by the American Committee, that it does seem that you were a pretty good trader . . .

Sir Charles Craven: Thank you, Sir.

2443. *Sir Philip Gibbs*: . . . and extremely active in selling the goods of your firm?

Sir Charles Craven: Yes.

2444. *Chairman*: Yes; but I think that “a pretty good trader” has reference to this: it was the suggestion whether Sir Charles was not always trying to endeavour to reduce the amount of royalty he had to pay. I think it was in reference to that.

Sir Charles Craven: Yes. But Sir Philip is trying to turn the word “trader” into “salesman.” It is not written “salesman,” and when an American refers to a trader he means a business man.

2445. *Sir Philip Gibbs*: Yes, that is so; but I think your letters point to the fact that you were very keen, quite naturally and quite honourably, to sell your goods in other countries—as you say, to ginger up the demand.

Sir Charles Craven: I did not say I wanted to ginger up the demand for goods in other countries.

2446. *Sir Philip Gibbs*: You wanted to ginger up the demand from Chile?

Sir Charles Craven: I did not say anything of the kind. I said I wanted to ginger up the Chileans to place their business with us, and it is a mutilation of my expression if you say that that is trying to increase the total armaments of the world.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

2447. *Sir Philip Gibbs*: I think it would amount to the fact that you would have been disappointed if those extra three submarines had not been given to your firm?

Sir Charles Craven: They have not been built.

2448. *Sir Philip Gibbs*: They are not built?

Sir Charles Craven: No. If they are built, we hope to get them.

2449. *Sir Philip Gibbs*: I am not making any suggestion against you, but I am trying to develop the argument that this foreign trade is in dangerous goods, and therefore that your salesmen and agents abroad are not dealing with ordinary commercial goods. There is something rather special about it.

Mr. Yapp: Obviously they are not dealing with ordinary commercial goods. They are dealing with armaments; there is no doubt about that.

2450. *Sir Philip Gibbs*: Thank you very much. I want to deal with a few questions about the methods you have with your agents. In Sir Herbert Lawrence's evidence yesterday he gave us, as a matter of fact, your standard contract. He begins by saying that no encouragement at all is given to your agents abroad to force orders. I understood from him that that was so.

Mr. Yapp: Quite.

2451. *Sir Philip Gibbs*: I am putting it to you, Sir Charles, because, after all, you are the managing director and chairman of Vickers-Armstrongs.

Sir Charles Craven: I think you will notice in the opening letter from my company it says that Mr. Yapp is the director primarily dealing with agencies.

2452. *Sir Philip Gibbs*: But you would deal with that matter?

Sir Charles Craven: Jointly with Mr. Yapp.

2453. *Sir Philip Gibbs*: But I want to ask you this question, Sir Charles, because it is a question of general policy, and I take it you accept responsibility for arrangements with your agents?

Sir Charles Craven: As chairman of the company, yes.

2454. *Sir Philip Gibbs*: May I therefore direct my question to you?

Sir Charles Craven: I am sorry. Would you mind repeating it?

2455. *Sir Philip Gibbs*: I am just going to read to you the facts. The first sentence of the ordinary contract you make with an agent is: "To do your utmost to promote the sale of our products"—"to do your utmost." There is no sinister suggestion in that, but it does seem, of course, from that first sentence in the contract, that they are urged on behalf of the firm to increase their sales?

Mr. Yapp: This is the ordinary standard form of agreement that is issued to all Vickers' agents, whether they are selling commercial goods or armaments.

2456. *Sir Philip Gibbs*: Or armaments?

Mr. Yapp: Yes. It is not peculiar to armaments, and it has not been taken out in the case of armament agency agreements.

2457. *Sir Philip Gibbs*: But it includes armaments?

Mr. Yapp: Yes, it includes armaments, and it does mean that they are directed to promote our business under our direction, when a government has decided to purchase arms. There is no doubt about that; it is the agent's job to endeavour to get the order.

2458. *Sir Philip Gibbs*: I imagine you are very closely in touch with them?

Mr. Yapp: Yes.

2459. *Sir Philip Gibbs*: And that you are in frequent correspondence with them, of course?

Mr. Yapp: Yes.

2460. *Sir Philip Gibbs*: Would you have any objection to my seeing some of the files of your correspondence?

Mr. Yapp: I do not think so. I do not know what files you particularly refer to.

2461. *Sir Philip Gibbs*: Well, I should like to ask whether it is possible to see certain files, subject to the consent of the Chairman in asking this question.

Chairman: If you can select a reasonable period, or an individual, or something as illustrative of the correspondence—

Mr. Yapp: You will not find separate files of correspondence with agents. We have not got all the correspondence together with a particular man.

2462. *Sir Philip Gibbs*: Why have you not?

Mr. Yapp: Because a letter may refer to a particular subject, and it will be in a special file, in a subject file. It will not be in an agent's file.

2463. *Sir Philip Gibbs*: But surely you keep your correspondence with your agents separate from your other business?

Mr. Yapp: Separate from our other business?

2464. *Sir Philip Gibbs*: You are responsible for the agents' department, are you not?

Mr. Yapp: Yes.

2465. *Sir Philip Gibbs*: And therefore you would have files under each man's name?

Mr. Yapp: Oh, no; I am sorry, we have not. We may have a certain amount of general correspondence.

2466. *Sir Philip Gibbs*: No, but I mean particular correspondence with a particular agent.

2467. *Chairman*: How do you deal with the correspondence with your agents?

Mr. Yapp: If we have an inquiry from a country abroad, and we have correspondence with our agency, the correspondence will be in the file relating to that inquiry, and all the correspondence relating to that inquiry will be in that file.

2468. *Chairman*: All the correspondence relating to that inquiry will be in a file by itself?

Mr. Yapp: Yes.

2469. *Dame Rachel Crowdy*: Presumably, being a very first class business organisation, you would have a very comprehensive cross index and therefore it would not be very difficult for somebody on the spot—

Mr. Yapp: No, I am afraid we have not got that.

2470. *Chairman*: At any rate, you could produce a file which would show all the correspondence about a particular subject?

Mr. Yapp: Yes.

2471. *Chairman*: You could take some inquiry about some particular armament business, and produce a file showing the whole correspondence with regard to a particular piece of armament business. Would that satisfy you, Sir Philip?

Sir Philip Gibbs: I must confess that I wanted rather more than that. I think perhaps I ought to submit to you, Sir, the files which I should like to see, unless you have any objection to my asking for them.

2472. *Chairman*: I personally have no objection whatever. I see on this slip which you have handed to me there is, first of all, correspondence with regard to China.

Sir Philip Gibbs: Yes. The dates are given here—from September, 1931, to April, 1933; then Bolivia and Paraguay.

2473. *Chairman*: Let us deal with the first one first of all. Would that require a pantechicon van, or could you bring it here in a motor car?

Mr. Yapp: It would not require a pantechicon van, but it would require some time to extract that correspondence from the various files which it is in.

2474. *Dame Rachel Crowdy*: Would it not possibly be much easier for Sir Philip to go and read it on the spot?

Chairman: Quite so.

Mr. Yapp: That would make no difference to us at all.

Dame Rachel Crowdy: But the pantechicon van would be avoided.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N.,
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR. [Continued.]

Mr. Yapp: Could we have the information on it, Sir? I take it that it is Japan and China, from 1931 to 1933?

2475. *Chairman:* Yes. Then there is Bolivia and Paraguay, from January, 1932, to December, 1934, and from 1928 to 1932. I think this is rather an excessive demand, straight off. Could not you satisfy yourself, Sir Philip, by examining one section, and then if you have any reason to want more, ask for more?

Sir Philip Gibbs: Yes, Sir.

Mr. Yapp: Very well. We will deal with Japan and China.

2476. *Chairman:* Would you prefer Japan and China, or Colombia and Peru?

Sir Philip Gibbs: Japan and China, I think.

2477. *Dame Rachel Crowley:* Might I suggest that to that is added Manchukuo, because it comes into the same situation?

Mr. Yapp: Certainly.

2478. *Chairman:* Would you be satisfied to go to the office, Sir Philip? It would save a lot of trouble.

Sir Philip Gibbs: Yes, and I should like to be accompanied by an able assistant. I suggest Dame Rachel.

2479. *Chairman:* Yes. Then two of the Commissioners will go to the office when you have had an opportunity of looking up this correspondence. If you will let the Secretary know when it is ready, two of the Commissioners will attend to go through it.

Mr. Yapp: Very well, Sir.

2480. *Sir Philip Gibbs:* Sir Charles, it seems to me, if I may say so without offence, that some of your agents in past history have not been perhaps altogether free from criticism as to their methods. Yesterday I think Sir Herbert or Mr. Yapp—I have forgotten who—said that there had been no direct charge of bribery against any agent of Vickers—but of course there have been one or two charges. There has been a charge of bribery, the Japanese one. A proven case of bribery is reported in the *Japanese Weekly Chronicle* of the 23rd July, 1914, concerning a Japanese officer, Admiral Fujii, in which he was found guilty of taking bribes from a dockyard official; and then I alluded yesterday to a very celebrated gentleman who has not been—

Chairman: We had that question yesterday, I think.

Sir Charles Craven: Yes.

2481. *Sir Philip Gibbs:* Do you know anything about that?

Sir Charles Craven: It was before I joined the company, Sir. I am not saying that there was nothing wrong, but I have found nothing to prove that there was anything wrong. That is all I can say about Admiral Fujii.

2482. *Sir Philip Gibbs:* You have gone into the question?

Sir Charles Craven: Yes. The only reference we can find to it is in *The Times*. I am not saying there was not something improper done, but I did say, whether it was yesterday or to-day I forget, that if the general manager at Barrow—he was a director of the company—had done all that he is alleged to have done, I cannot help thinking he would not have remained in his job.

2483. *Sir Philip Gibbs:* There is a rather more recent case of one of your agents who got into trouble, a Mr. Arthur V. Lander, a Vickers agent, who was expelled from Turkey on 3rd August, 1933, without warning, on charges of espionage, corruption of state employees, and *lèse majesté*. Have you inquired into his case at all?

Sir Charles Craven: I think he was one of Mr. Yapp's staff.

Mr. Yapp: We did at the time. The first intimation we had was that Mr. Lander had been expelled from Turkey, and we got into touch with the Foreign Office, and we were informed by the

British Ambassador in Turkey, through the Foreign Office, of the allegations that had been made against Mr. Lander by the Turkish Government, and generally they were that Mr. Lander had been giving small sums of money to civil servants to do translating and typing work for him. They did accuse him also of being too inquisitive as regards their munitions works, the placing of arms orders, and that sort of thing. But we were specifically informed by the Turkish Government that this did not reflect on us at all, and our relations with the Turkish Government continued as before.

2484. *Sir Philip Gibbs:* May I ask you whether, with regard to your agents, you have any item under expenses in addition to their commission?

Mr. Yapp: Only, as I mentioned to Dame Rachel Crowley yesterday, that in certain cases we do make a contribution to their office expenses. That, I think, in no case is more than £500 a year, and sometimes even that is set off against commissions that may become due to them. But there are no other items of expenses.

2485. *Sir Philip Gibbs:* May I ask what method of payment was arranged with regard to Sir Basil Zaharoff—that is to say, what payment he was made, or commissions, on the orders he put into the firm of Vickers?

Mr. Yapp: As far as we are able to trace, Sir Basil Zaharoff did originally receive a commission on orders which he obtained for us. Sir Basil Zaharoff, from the records I have been able to trace, started with the Nordenfelt company in 1877. The Nordenfelt company subsequently amalgamated with the Maxim company, and the company became the Maxim Nordenfelt company. It was then taken over by Vickers, and became Vickers Sons & Maxim.

2486. *Sir Philip Gibbs:* And Sir Basil remained with you for a very considerable period, did he not?

Mr. Yapp: For a very considerable period.

2487. *Sir Philip Gibbs:* And, as a matter of fact, he is still one of your agents.

Sir Charles Craven: For Spain only.

2488. *Sir Philip Gibbs:* But you are associated with that company. You benefit by his activities?

Sir Charles Craven: Certainly as regards Spain.

2489. *Sir Philip Gibbs:* With regard to Sir Basil, who is rather an important figure in the world, and will go down to history, there is no doubt, you will agree, that his value to you was very largely his influence in the political circles of Europe and the world. Do you agree with that, Sir Charles?

Sir Charles Craven: May I submit, Sir, that these are questions that should have been addressed to the chairman of the parent company, who appeared here yesterday, who received many inquiries about Sir Basil, and I think it would be almost improper for me to try and answer them.

2490. *Chairman:* I think we have got all that is necessary. He is your agent only for the Spanish business?

Sir Charles Craven: Yes. I was quite a junior person when Sir Basil was the great salesman.

2491. *Sir Philip Gibbs:* I accept that immediately, Sir Charles. I think that is very fair. I have to ask one general question, and that is this, that in this business of the selling of munitions in foreign countries it is no doubt rather valuable to a firm like Vickers to have people in very high positions who are able to mix with the politicians and with the military and naval staffs of these countries. Do you think that that constitutes a valuable agency for your firm—those qualities?

Mr. Yapp: I do not think we have any such person to-day.

2492. *Sir Philip Gibbs:* You have nobody to succeed to Sir Basil Zaharoff?

Mr. Yapp: Oh, nobody in the same position at all; no.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT MCLEAN and Mr. A. DUNBAR.

Sir Charles Craven: Do you mean from a social point of view?

2493. *Sir Philip Gibbs:* No, I mean from a political influence point of view; that is to say, friends of prime ministers and politicians, and those who rule the destinies of mankind.

Sir Charles Craven: There is no representative of the company who represents us in all countries, no. It is dealt with by Mr. Yapp's agents.

2494. *Sir Philip Gibbs:* I am not going to ask you any more questions, because Dame Rachel, I am sure, wants to ask you several; but may I suggest that throughout the correspondence that was published, inadvertently no doubt from your point of view, before the Committee of Inquiry in America, you show a certain levity of mind with regard to the business that you are doing; that is to say, that all through those letters the general tone is that you think the more munitions in the world the merrier for the world, and that it is a jolly good thing, really, for all countries to buy munitions of war, and that you personally really regard with some contempt all methods to restrict armaments and all peaceful associations which have the idea of the limitation of arms? Is that a fair expression of the rather jocular tone of your letters?

Sir Charles Craven: Most unfair.

Sir Philip Gibbs: You say "most unfair."

Those are all the questions I want to ask you, Sir Charles.

2495. *Dame Rachel Crowdy:* My questions are going to be very short. Will you turn to page 333 of Part I of the American Inquiry? In Exhibit No. 22, which is a letter from you to Henry R. Carse, Esquire, at the top of page 333, you say: *All that you and I gain by the transaction will be that we shall know that if the ship is built Vickers will get the order. If, on the other hand, Geneva or some other fancy convention decide that large submarines have to be abolished, no definite contract will be placed, and the Admiralty can retire gracefully without having to pay us anything.* Then in Exhibit No. 23, again writing to the same man, Mr. Carse, of the Electric Boat Company, you say: *In other words, they—that is, the Admiralty—will have the right to withdraw their promised order for the second ship if Geneva or any other troublesome organisation upsets the large submarine.* Well, I find myself in rather the same state of mind as Sir Philip. The implication in my mind is quite definitely that certainly Sir Charles Craven and, therefore, probably Vickers, is, I will not say working against, but is definitely against any organisation, international or otherwise, which would give a feeling of security in the world. Would you like to make any comment on those two letters of yours, because they are very definite statements on your part, or implications on your part, that you do not want any peaceful settlement, and that you think it is rather better to have a good export of arms by your firm rather than peaceful settlement?

Sir Charles Craven: I do not think anybody could reasonably, by intercepting private letters, anybody's private letters, have the right to assume that. You are really asking my personal opinion of the League of Nations?

2496. *Dame Rachel Crowdy:* No, of any international organisation which will create peace *vis-à-vis* the arms firms who will create war.

Sir Charles Craven: Well, I am not admitting that armament firms do create war, and I think very few reasonably minded people do think that they create war.

2497. *Dame Rachel Crowdy:* But you have no great feeling in favour of any attempt at peace by diplomacy?

Sir Charles Craven: I think that the League of Nations was the most wonderful ideal that has happened in our time, but I submit that it is not for me, as a private individual, to say what I think about the machinery that is operating the League of Nations. I do not think I have any right to. But

I did in my covering statement refer to my free and easy language.

2498. *Dame Rachel Crowdy:* I think, if I may say so, that your free and easy language is the most helpful thing possible to this Commission, because if one writes in diplomatic language one does not always say what one thinks, whereas if one writes as one friend to another one says what one thinks, hoping for the best.

Sir Charles Craven: And hoping that the other friend will put the letter in the fire.

2499. *Dame Rachel Crowdy:* You have got nothing else you wish to say on those two Exhibits, Sir Charles?

Sir Charles Craven: No, I do not think so.

2500. *Dame Rachel Crowdy:* Then would you mind turning to page 407, Exhibit No. 127. This is a letter to you, and not from you and incidentally it does not seem to be signed. There is some rather mysterious figure in the left-hand corner.

Sir Charles Craven: That is Spear's initials.

2501. *Dame Rachel Crowdy:* I want to know if you are really in agreement with what Mr. Spear implies here. He says: *I hear that friend Livingston passed through New York recently on his way back from Peru. I, however, have not seen him. It is too bad that the pernicious activities of our State Department—that is the American State Department—have put the brake on armament orders from Peru by forcing the resumption of formal diplomatic relations with Chile.* Do you agree with Mr. Spear that it is a great pity if brakes are put on your armament orders while formal diplomatic relations are resumed?

Sir Charles Craven: I really do not think that I am entitled to answer a question of that kind. Here is a letter written to me by a gentleman who has not even signed it, and I did not reply to it. That is my answer. I did not express any opinion to him about what I thought of his letter.

2502. *Dame Rachel Crowdy:* I rather hoped that you might feel you could express an opinion now, because it would be extremely interesting to know if you agreed with that or not.

Chairman: But this is not your letter, is it, Sir Charles?

Sir Charles Craven: It is a letter written by Mr. Spear, and it is merely initialled, and not signed.

2503. *Chairman:* I do not think, Dame Rachel, that you can ask what the writer meant, or thought.

Sir Charles Craven: Dame Rachel asked me what impression I had when I received that letter. The only reply I can give you—this was in August, 1928—is that I did not answer it.

2504. *Dame Rachel Crowdy:* That might be due to a dozen things.

Sir Charles Craven: It might be; yes.

2505. *Dame Rachel Crowdy:* I think that is all I want to ask you at the moment on the American evidence, though I have got some other questions which I should like to ask you later, if I may, on general subjects.

Chairman: Do you want to exhaust all the questions that you wish to ask Sir Charles now? We are not limiting it to any particular branch, I think.

2506. *Dame Rachel Crowdy:* Then shall I go on? I have only got very few questions to ask. I think, Sir Charles, that you have given us some of the information which I want in your statements that we had yesterday; but you will not mind my repeating a question, and if it is out of order then of course I shall accept the ruling of the Chairman immediately. Can you give us any idea of how many employees of your companies were engaged in the manufacture of arms between 1st January, 1932, and 1st November, 1935? You cannot give it immediately, obviously. I shall be quite pleased if you will take January, 1932, to November, 1935.

9 January, 1936.]

Commander Sir CHARLES W. CRAVEN, O.B.E., R.N.,

[Continued.]

Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

Sir Charles Craven: You are really asking me if our Government have placed more orders. I cannot, of course, give you details of it.

2507. *Dame Rachel Crowdy:* Would you be able to look up the figures, with not too much difficulty, to find out how many people you were employing?

Sir Charles Craven: Yes, I can give you the figures, but I am not sure whether it ought to be in public, if you want to go up to the present time.

2508. *Dame Rachel Crowdy:* Yes, it is practically to the present time—to November, 1935.

Sir Charles Craven: On that, I would submit to the Chairman that he should give me a ruling as to whether I should answer it.

2509. *Chairman:* I do not quite follow the object of fixing these dates.

Dame Rachel Crowdy: I rather want to find out what proportion of these men were engaged in manufacturing arms for export for non-British concerns at those dates.

Sir Charles Craven: We could give you that, without divulging what our own country has ordered.

2510. *Dame Rachel Crowdy:* It is no good giving the foreign only. What I want is quite roughly the number of people employed, but perhaps you would feel you could hand it to the Commission, if you thought it would be better not to give it to the public. That would suit me just as well.

Sir Charles Craven: The foreign figures I do not mind giving in public a bit; but I suggest it is not quite proper for me at this moment to give publicly the Government orders—not at the moment.

Dame Rachel Crowdy: But would you give us—

Sir Charles Craven: I would very much rather that you asked the Government departments concerned what orders were placed with me. It would be very much simpler.

2511. *Dame Rachel Crowdy:* It is the number of men employed that I really want.

Sir Charles Craven: Of course there are certain common departments, a foundry, for instance, where it is very difficult for me to allot the men over these periods; but I can do it if you will accept it as an average. I shall have to turn my money back into men, and if you will accept that, it will be within one or two per cent.

2512. *Dame Rachel Crowdy:* Then if you will do that, perhaps you will add what proportion are highly specialised workers and not easily to be transferred into the production of peaceful products.

Sir Charles Craven: I can easily give you what we call the proportion of the skilled, semi-skilled men, and the unskilled men.

2513. *Dame Rachel Crowdy:* Many of those, or most of those, could be transferred to other employment if necessary?

Sir Charles Craven: Most of them can.

2514. *Dame Rachel Crowdy:* I understand that the bulk of your men can be so transferred.

Sir Charles Craven: Yes—not all of them. If a man has been spending his life, the whole of his life, in designing a fuse, he is not much use for anything else.

2515. *Dame Rachel Crowdy:* But the bulk of them can be transferred?

Sir Charles Craven: Yes; provided, always, that I can get the orders.

2516. *Dame Rachel Crowdy:* Shall I give you those questions in writing?

Sir Charles Craven: It would help very much if you would.*

2517. *Dame Rachel Crowdy:* Then there is one other thing that I should like to know about. Do you make your peaceful products and your war products in the same section of your factories and shops—actually in the same shops—or are they all mixed up together? Of course, obviously some raw

materials are by themselves, but have you any strict division between your peace products production and your war production?

Sir Charles Craven: We have the strict division in the Metropolitan Carriage Company which is concerned with railway rolling stock, and is a commercial firm. Then you have the rubber company, a little company at Glasgow, which is 99 per cent. commercial, and then we have a little company called Boby's, but all of those companies are given as purely commercial. In our own shops—I am thinking of one of our biggest works—the answer is that there is no division. We do have special designers. For instance, we have a specialist on cement plant, who designs all our cement plant, and he has a team of his own working, and it may be that probably three or four of his team of thirty—I cannot say how many he has at the moment, because it varies—may be working on commercial businesses. They are really specialists, but the rest of them would go to another drawing office, if necessary; they can switch over. But in the shops themselves, excepting for the very special armaments, they are all interchangeable; they are not separated in these works which I am thinking of, where so many of these people are employed.

2518. *Dame Rachel Crowdy:* I was not really meaning: can your men be switched from peace production works to war production work; I was meaning, do you actually make your peace products output in a different section of your factories?

Sir Charles Craven: I am sorry. I did not quite understand. No, they are in the same section.

2519. *Dame Rachel Crowdy:* For example, in the event of a state monopoly, I was wondering about the division of your peace work and your war production.

Sir Charles Craven: They are all in the same shop.

2520. *Dame Rachel Crowdy:* They are all mixed up together?

Sir Charles Craven: Yes. I mean to say that a cement plant, for example, requires the best type of boiler work, and that is obviously done in the same shop where we do our Admiralty boilers.

2521. *Sir Kenneth Lee:* Might I return to another point? Supposing your research department makes a new invention, how is it exploited? Do you take out a patent?

Sir Charles Craven: A patent is taken out in the joint names of the man and the firm and, as I tried to explain yesterday, if it is something which has nothing whatever to do with our business at all, we will go on with the preliminary stage, taking out the patent and all that, and then probably if it did not suit us we should say to the man: "You can do what you like with it," and we should probably help him to introduce it to the public. In the one case, where it is not akin to our business, our general rule is that we should reward the man; in the other case we may take it over and may reward them.

2522. *Sir Kenneth Lee:* That means disclosure to the world?

Sir Charles Craven: Immediately we apply for a patent of any sort, the Government can step in and make it secret.

2523. *Sir Kenneth Lee:* So it is never disclosed?

Sir Charles Craven: By us to the Admiralty, do you mean?

2524. *Sir Kenneth Lee:* No; to the outside world.

Sir Charles Craven: Not without the defence departments' approval.

2525. *Sir Kenneth Lee:* Are there many products of that sort?

Sir Charles Craven: Do you mean where there are secret patents at present?

2526. *Sir Kenneth Lee:* Yes.

Sir Charles Craven: There are not many secret patents in our company, just now; but there are

* See Appendix 20, p. 432.

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT MCLEAN and Mr. A. DUNBAR.

a few. I can let you know the number if you want it; but there are lots of secret designs, of course.

2527. *Sir Kenneth Lee*: But the products you are advertising in those German papers, were they your latest products?

Sir Charles Craven: Well, they were, I suppose, but we have a different design. The War Office have their own type of tank to fulfil another purpose, and we do not sell that tank without their permission.

2528. *Sir Kenneth Lee*: What I am trying to get at is this. Would it not be easier, if the Government were making all the munitions, to keep things secret?

Sir Charles Craven: I do not think it would.

We do not do, and we dare not do, anything of the kind which you suggest may be going on.

2529. *Sir Kenneth Lee*: But how long in fact does it take before a new weapon becomes known to the world, when it is produced by you?

Sir Charles Craven: I always reckon that by the time anything gets to sea in a ship, the idea is out very very quickly then. Foreigners call on board the ship, and they get the idea of it, and within a couple of years after that they have probably got that thing, I should think.

2530. *Sir Kenneth Lee*: And your contention is that it would probably come out just as quickly if it were government-produced as if it were privately produced?

Sir Charles Craven: Yes. I am perfectly satisfied that anything confidential which we do for the services is just as safeguarded in our works as it is in a government works.

2531. *Sir Kenneth Lee*: Do you have agreements with your people so that they cannot leave your employ?

Sir Charles Craven: For the specialists—certain specialists—yes. We cannot with the work-people, of course.

2532. *Mr. Spender*: I do not want to worry this question; but there do seem to be some aspects of it which have hardly been touched upon. Mr. Arnold Forster said in his evidence something about your company supplying orders to Peru, and passing on orders for Chilean warships to Brazil. It does seem to us that these local agreements may have that effect, that if one of you can persuade one government to place an order, the other government will follow, and will place another order accordingly.

Sir Charles Craven: Yes; but the answer to a submarine is not a submarine. The answer to a submarine is something to do away with a submarine.

2533. *Mr. Spender*: But still, it might be so?

Sir Charles Craven: But it does not arise in the case of guns, I think.

2534. *Mr. Spender*: It is commonly alleged, to take an imaginary example, that the selling of torpedo boats to Greece would lead to the sale of some other craft, destroyers it might be, to the Turkish Government. I have taken only quite an imaginary case. I suppose that has gone on all through?

Sir Charles Craven: I do not know of any case where a Vickers man has gone from one country and said: "I have sold so many guns against you, and you had better buy so many guns".

2535. *Mr. Spender*: I do not allege that.

Sir Charles Craven: But it is alleged by most of the witnesses.

2536. *Mr. Spender*: Most of our witnesses?

Sir Charles Craven: A lot of them have referred to this thing.

2537. *Mr. Spender*: Then there is another allegation, which is rather a general one, that this trade differs from all others, in that competition does not hurt the competitors. The more lively it is, the more likely each competitor is to gain by it. Do not think I am suggesting that you do anything that you should not do.

Sir Charles Craven: It comes back to this, that if a government has made up its mind to have

armaments—if it has made up its mind to have them—it is going to get them from someone.

2538. *Mr. Spender*: You do not think that the general readiness to supply these weapons, and the profits to be made out of them, is a stimulant—I do not say a primary one.

Sir Charles Craven: It is not a very profitable business, if you take it all in.

2539. *Mr. Spender*: You told me yesterday that you would provide figures, if you remember, showing the money gained and the moneys distributed in money values, in dividends and bonuses, which would enable us to compare it with your list.

Sir Charles Craven: Yes. The secretary, I think, has got what he thinks you want.* This was really the counterblast from writing down.

2540. *Mr. Spender*: It was so as to give us some idea of the position. I have not time to go into it now, but what is your general view?

Mr. Reid Young: The actual increases in capital which took place were from the original capital of £155,000 in 1867 to £20,679,290 at the 31st December, 1924. The latter figure was reduced by £8,210,322 in January, 1926, by writing down the ordinary shares from £1 each to 6s. 8d. each, leaving the present issued share capital at £12,468,968. Of the total issued capital £9,400,536 was issued for consideration other than cash (for purchase of assets of and shares in Companies acquired), £8,883,754 represented issues for cash, and £2,395,000 represented bonus issues. Of these bonus issues, shares to the nominal value of £254,558 were issued out of profits, shares to the nominal value of £1,100,000 were issued out of premium on shares of previous issues, and shares to the nominal value of £1,042,442 were issued in respect of revaluation of assets. The details of these issues are shown in the statement* which we submit.

2541. *Mr. Spender*: You have not got any figures showing what has been the average profit?

Mr. Reid Young: Yes; we have supplied that in our statement.

2542. *Mr. Spender*: I just want to ask a question on a point which rather puzzles me. It is with regard to your agreements with foreign firms. I do not think we have got copies of those.

Sir Charles Craven: You have a precis of them.

2543. *Mr. Spender*: We have rough particulars of them. What is the precise result of them? Is it that you mean you have interchange of orders? If you do not control them, and do not mean to control them, why do you have them?

Mr. Yapp: I think you will usually find they are agreements under which we use patents of theirs, or they use patents of ours.

2544. *Mr. Spender*: It is the interchange of patents?

Mr. Reid Young: There is no general agreement for interchange of patents to specific foreign firms.

2545. *Mr. Spender*: But each agreement contains some specific patents?

Sir Charles Craven: We have offered to bring any of those agreements here, Sir.

2546. *Professor Gutteridge*: I should like to ask Mr. Reid Young this question, arising out of his answer. Did these capital bonuses represent a capitalisation of profits?

Mr. Reid Young: Only £254,000.

2547. *Professor Gutteridge*: When was that?

Mr. Reid Young: In 1878.

2548. *Professor Gutteridge*: It was a long time ago?

Mr. Reid Young: Yes.

2549. *Dame Rachel Crowley*: May I ask one question on a point which Mr. Spender brought out? I am referring to Exhibit No. 68, which is on page 118 of Part I. Mr. Spender was asking about a statement by Mr. Spear before the Committee, on the

* See Qs. 1930-1942 and Appendix 16, p. 426.

9 January, 1936.]

Commander Sir CHARLES W. CRAVEN, O.B.E., R.N.,

[Continued.]

Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

supply of boats to Peru and Chile. You will remember he mentioned the case a moment ago. Mr. Spear says in evidence: *We were at that time still building two boats for Peru, and he goes on to say: . . . we did not think it would look very well for us to be dealing with the Chileans at the same time that we were dealing with the Peruvians.* Then Senator Clark says: *So that you preferred to tell the Chileans that the best deal they could make would be with your associates Vickers, out of whom you could get a commission?* In that case, the Electric Boat Company was getting a commission from you for the boats you delivered for Chile; and would you get a commission from them for the boats they got from Peru?

Sir Charles Craven: No, we do not get any commission on any foreign orders.

2550. *Dame Rachel Crowdy:* They would merely get commission from you?

Sir Charles Craven: I am not sure of that. I should like to make sure. Chile is a precluded country, and Peru is a precluded country. I should have to make that a special arrangement.

2551. *Dame Rachel Crowdy:* It is within the defined geographical region?

Sir Charles Craven: Yes. We have no rights there.

2552. *Sir Thomas Allen:* I should like to clear up one or two points with regard to the evidence yesterday. I have nothing to say on the evidence yesterday, but I do remember that when Mr. Fenner Brockway came before us he told us that there are close relations and connections between the raw material industries and other industries, and in particular with banks, and then he went on to say that loans to non-producing nations are sometimes raised by the firms which supply armaments. I should like you, Sir Charles, if you would, to tell us this. Have you any experience in that direction and have the Vickers-Armstrong company, or any of the associated companies, arranged loans with any foreign governments at any time, and, if so, what is the situation with regard to them to-day?

Sir Charles Craven: The only loan that I know of was issued in connection with the Chinese contract for aeroplanes, but they were commercial aeroplanes, so I do not think they come into the scope of this Commission.

2553. *Dame Rachel Crowdy:* Was that secured on the customs?

Sir Charles Craven: Yes.

2554. *Sir Thomas Allen:* And that was a loan to the government?

Sir Charles Craven: No, it was not a loan, it was an issue of Chinese bonds in London.

2555. *Professor Gutteridge:* You got the bonds and put them on the London market; is that it?

Sir Charles Craven: Yes.

2556. *Sir Thomas Allen:* Then I should like to develop the question raised by Sir Kenneth Lee just now with regard to inventions. We were told that an inventor coming to a private manufacturer in peace time would not be more likely to get money made available for development of his ideas than if he went to the government—that a man with an idea has a better chance of a fair deal if he negotiates with a government department. You have had experience on both sides. Could you enlighten us as to what is the method within the government with regard to patents?

Sir Charles Craven: Yes. I think if it is something good, or something original, they would take it up; but I think he would get away with it much more quickly in a private firm. There is much more machinery to go through in the government department. I never shall invent anything, but if I did, I should go to a private firm.

2557. *Sir Thomas Allen:* You would take it to a private firm rather than to a government department?

Sir Charles Craven: Yes.

2558. *Sir Thomas Allen:* Then dealing with profits, I think it was Mr. Hunter who came before us, who quoted something which Sir Herbert Lawrence said in 1923, that unless armament orders are available it will be difficult to earn satisfactory profits. He put this forward as evidence that Messrs. Vickers' profits are closely dependent on contracts for war material. Would you enlighten us as to that?

Sir Charles Craven: That is a perfectly true statement. I think Sir Herbert Lawrence said so yesterday. We are an armament firm, and the figures which we have submitted will show that.

2559. *Sir Thomas Allen:* We were also told that one of the reasons for the establishment, say, of an armaments board would be because the three services are competitive in the market sometimes for similar products; that you would get, say, the three services coming to you for a similar armament or instrument of war, and therefore there was very considerable overlapping. Have you any experience in that direction at all?

Sir Charles Craven: There is no overlapping at all, as far as we are concerned to-day. But I submit this is rather delicate ground; and I think I might suggest that this question should be addressed to the government witnesses. However, I should say there is no overlapping to-day—in peace time.

2560. *Dame Rachel Crowdy:* There is only one other question, which I have been requested to ask you. Will Sir Charles Craven state whether Messrs. Vickers received from the German firm of Krupp any payment, or any benefit, either in shares or otherwise, for the use of Vickers' inventions by Krupp in supplying the German army with armaments and munitions of war?

Mr. Yapp: You are asking if we received anything from Krupp.

2561. *Dame Rachel Crowdy:* Yes.

Mr. Yapp: The answer is "No".

Sir Charles Craven: You said from Germany, I think?

2562. *Dame Rachel Crowdy:* Yes.

Mr. Yapp: There was a firm who had received a licence to manufacture the Maxim gun and we did receive a small amount of money for guns which they manufactured during the War, through the German clearing house, but nothing from Krupp.

2563. *Professor Gutteridge:* I think that so far as the evidence goes, it was a question between the Electric Boat Company and the Germans?

Mr. Yapp: Yes.

2564. *Professor Gutteridge:* You had some patents which were used by the Germans during the War, did you not?

Mr. Yapp: Yes. We have never got anything out of them yet.

2565. *Chairman:* I am anxious that everybody should have all the questions asked which they wished to be asked. We have received a communication indicating a number of questions that one of the Parties of Great Britain wish to have asked. A number of them are quite irrelevant; a number of them indicate the mentality of the questioner; and some of them I would like to put to you, because it is desirable that these questions should be answered. There is one here which inquires whether it is a fact that The Bank of England (via Sir Otto Niemeyer, Vickers-Armstrongs Ltd. and the Ottoman Bank) has or till recently did have close financial and directorial connections with Vickers Ltd. In May, 1935, a big Bank of England loan to foster German re-armament was made known. Was Vickers Ltd. aware of this loan and did it benefit therefrom?

Sir Charles Craven: I have never heard of it; but may I submit that Sir Otto Niemeyer was not

9 January, 1936.] Commander Sir CHARLES W. CRAVEN, O.B.E., R.N., [Continued.
Mr. F. C. YAPP, Mr. J. REID YOUNG, C.A., Sir ROBERT McLEAN and Mr. A. DUNBAR.

nominated by the Bank of England but by Armstrong Whitworths.

2566. *Chairman*: Then they say that Sir Otto Niemeyer went as Bank of England adviser to South America in 1930 and Australia in 1931. "Did Vickers-Armstrongs Ltd., of which he was a director, receive any orders as a result?"

Sir Charles Craven: No, Sir.

2567. *Chairman*: "Were the tanks mentioned in the *Army, Navy and Air Force Gazette* of the 8th November, 1934, and quoted in Mr. Pollitt's evidence, manufactured by Vickers-Armstrongs Ltd.?"

Sir Charles Craven: Yes, Vickers-Armstrongs.

2568. *Chairman*: They were?

Sir Charles Craven: Well, they were advertisements. Is it the paper that was referred to yesterday?

2569. *Professor Gutteridge*: There was an allegation made by one of the witnesses that Vickers had made tanks which they had sent out to the Chinese, to one of these Chinese general fellows, and that he had used them to hunt out the communists.

Sir Charles Craven: It is quite possible, Sir. We do not know what they use them for. But we did sell a few tanks to China.

2570. *Chairman*: The next question is: "How great a proportion of Vickers' arms production goes abroad, and to what countries?" We have got that information.

Sir Charles Craven: Yes.

2571. *Chairman*: The next question is: "On page 3 of Vickers' memorandum the new anti-aircraft gun is mentioned. Since Vickers also control aeroplane producing firms, must not such a gun be very useful for Vickers Ltd.?" Well, I think that answers itself. The next question is: "Has Vickers-Armstrongs Ltd. had any arms exports stopped by the Foreign Office? If not, does not that explain the statement in the memorandum that it wholeheartedly supports the present licensing system?" Have you had any stopped?

Sir Charles Craven: We had one licence suspended. A licence was issued to us for the export of munitions to a certain country, and it was suspended for a little while, and it was then renewed.

2572. *Chairman*: The next question is: "Is it a fact that Mr. Bryce, nephew of the late Lord Bryce, went to Belgrade shortly after the War in the dual capacity of *The Times* correspondent and Vickers'

agent? That after Mr. Bryce failed to secure a contract for a new bridge across the Danube, he lost both the Vickers' agency and his position with *The Times*?"

Sir Charles Craven: Yes.

2573. *Professor Gutteridge*: He was actually a correspondent of *The Times*?

Mr. Yapp: Yes. Mr. Bryce was a gentleman who represented Armstrong-Whitworths before the fusion of Vickers and Armstrongs, and during certain years he was acting as correspondent for *The Times*. That we have found out since. I think his association with *The Times* ceased in 1925. The fusion of Vickers and Armstrongs was at the end of 1927, and Mr. Bryce remained with the company which retained the connection of Vickers-Armstrongs in that country.

2574. *Chairman*: I have asked the questions, and they have been answered; and I hope I have satisfied the persons who asked that they should be asked. I think those are all the questions that I want to address to you; but before we adjourn I want to ascertain whether anybody wants to ask any questions on the other part of the information given to us; because we shall have to have another meeting about that, unless you can do it to-night.

Professor Gutteridge: There were one or two questions which I wanted to ask of Sir Charles. It seems rather a pity to make him come all the way here to-morrow.

2575. *Chairman*: Are they on matters which are included in the second part?

Professor Gutteridge: Yes. I am pretty sure that Sir Charles would not wish to answer them in public.

2576. *Chairman*: You mean on expansion?

Professor Gutteridge: Yes.

Sir Charles Craven: Yes, I do not think I could answer them in public.

Professor Gutteridge: That is why I did not ask Sir Charles those questions.

2577. *Chairman*: Perhaps we could hear that evidence in private, and then we need not ask Sir Charles to come here again.

Professor Gutteridge: My questions will not take more than three or four minutes.

Chairman: Very well; we will clear the room and hear that evidence now.

(Further evidence was heard in camera.)

(Adjourned.)

[Sir Charles Craven subsequently submitted further evidence which he desired to be added to the records of the Royal Commission. This is reproduced in Appendices 21 and 22.]

INDEX TO APPENDICES

[Appendices 1-9 relate to Statement No. 3 and are numbered to correspond with the Headings in the Questionnaire addressed to Messrs. Vickers Limited on the 23rd April, 1935 (see p. 345). Appendix 1 relates to Questions 1 and 2; there is no separate Appendix relating to Question 2.]

(1) *Vickers Group*—

APPENDIX 9.

STATEMENT ON THE PRACTICE OF THE FIRM IN REGARD TO THE ADVERTISEMENT OF, AND THE SOLICITING FOR ORDERS FOR, ARMS AND MUNITIONS OF WAR.

It is proposed to deal with this question under the following headings:—

- (a) Advertising;
 - (i) Press Advertising;
 - (ii) Exhibitions;
 - (iii) Sundry Advertising;
 - (b) Selling arrangements;
 - (c) Circulation of Pamphlets, Leaflets, etc.;
 - (d) Soliciting for Orders;

and the following Companies are dealt with individually:—

Vickers-Armstrongs Limited;
Vickers (Aviation) Limited and The Supermarine Aviation Works (Vickers) Limited;
The Whitehead Torpedo Co., Limited;
The Thames Ammunition Works Limited;
these being the main Armament producing Companies in the Group.

With regard to Vickers Limited, figures are given for this Company separately. It will be appreciated that as Vickers Limited is the parent Company of the Group, a certain amount of Group advertising is done by that Company.

In regard to the following Companies:—

English Steel Corporation Limited;
Industrial Steels Limited.
Taylor Bros. & Co., Limited;
The Metropolitan-Cammell Carriage & Wagon Co., Limited, and Subsidiaries;
Robert Boby Limited;
Cooke Troughton & Simms Limited;
British Separators Limited;
Industrial Steels Limited;
Variable Speed Gear Limited;
Vickers (Ireland) Limited;
Ioco Rubber & Waterproofing Co., Limited;
Vickers Train Lighting Co., Limited;

it is again pointed out that no armament advertising in any shape or form is done by them and this despite the fact that the business of some of them includes certain armament products.

VICKERS-ARMSTRONGS LIMITED.

(a) ADVERTISING.

(i) Press.

Detailed returns are appended, giving the expenditure on Press Advertising of Armament products by this Company for the last five years, and showing the names of the Journals in which the advertisements were inserted. From these lists it will be seen that advertising of this nature is almost exclusively confined to service journals. Typical examples of advertisements which have appeared are attached.*

In regard to advertisements which appear in foreign journals, in practically all cases these have been undertaken at the express request of the Agents in the particular countries concerned. The general view of the Company is that armament advertising whether in the public or technical press is of little value, but it is found in certain instances that the Agents regard such advertising as an advantage from their own point of view as showing that they represent important British interests.

Much has been said and written in regard to advertisements for Carden-Lloyd Commercial and Military Vehicles and Field and Anti-aircraft Guns, which appeared in the German papers "Wehr und Waffen" and "Militär Wochenblatt". Explanations of the reason for these advertisements have been given by the Company on various occasions, but it is desired to take the opportunity again of stating that the reason for the insertion of these advertisements was that the Journals in question are regarded by Military authorities as two of the leading technical journals on the subject, and have a considerable circulation among staff officers in South

American Republics and North European countries where the German language is used extensively. For this reason the advertising was undertaken, and not as has been suggested with a view to selling the products advertised, or in fact any type of armaments, to Germany. In any event such sales would not have been possible to Germany or any other country coming under the prohibitions of the Treaty of Versailles.

(ii) Exhibitions.

On three occasions only within the last five years has the Company taken any part (apart from the display of furniture and crane indicators in trade exhibitions in this country) in any exhibitions at home or abroad. The three cases in question were the Canadian National Exhibition and the Copenhagen Exhibition in 1932 and the Brussels Exhibition, which is at present running, at all of which exhibitions there was a Vickers Group stand. In the Group's stands at these Exhibitions no armament material was exhibited, it being considered that such a means of advertising would not be of any service to the Company. At Copenhagen, however, at the request of the Danish Government, a 75 mm. Anti-aircraft Gun was exhibited in the grounds of the Exhibition.

Showroom.

It may be of interest to the Commission to know that a permanent Showroom is maintained at Vickers House, Broadway, Westminster, London, S.W.1, which is the Head Office of Vickers Limited and Vickers-Armstrongs Limited, in which are exhibited examples of many of the types of production of the Companies both Armament and commercial.

(iii) Sundry Advertising.

Apart from the annual distribution to clients, of diaries bearing the name of the Company, and pamphlets, which are more particularly referred to hereafter, general sundry advertising is negligible.

From the above remarks it will be gathered that the policy of the Company, generally speaking, is that advertising of armaments with a view to promoting sales is of little, if any, value.

(b) SELLING ARRANGEMENTS.

It is convenient to refer to this matter of selling arrangements under two headings, viz.:—

- (i) at home, and
- (ii) abroad.

(i) Home.

As to home sales, i.e., sales to British Government Departments, no propaganda is used, and there are no selling arrangements, as generally understood—that is to say, no agents are employed and no soliciting for orders from the Departments concerned is carried on. There is, of course particularly as regards the class of orders referred to in 2 below, continued contact and collaboration between the Company and the Government Departments, both on technical and commercial questions, and the services of the Company in all directions are regarded as being fully at the disposal of those Departments. It is pointed out that the practice of the Government Departments may be divided into two categories:—

1. The placing of orders for material which is produced by several Companies throughout the country.

2. Orders for material for which Vickers-Armstrongs Limited is the sole Company in the country equipped for production.

As regards the first class of materials the practice of the Government Departments is to issue enquiries to firms on their lists capable of producing the material required, and this Company, in common with the others, passes in its tender, the orders eventually being placed with the Company selected by the Department concerned.

In regard to the second category, the method adopted by the Government Departments may be divided into two classes; firstly, when the order is placed on the basis that price is fixed by the checking of estimates; and secondly, when the order is placed on a "costed" basis.

* Not reproduced.

It will be seen, therefore, that the practice of the Departments outlined above does not afford any scope for the use of general sales methods, and such methods are not employed by this Company.

(ii) *Abroad.*

The practice of the Company is to appoint a local agent in each country where there is a possibility of business, and in appointing such agents to select a company or individual of the highest possible standing. Wherever possible, the appointee is a British firm or a British national. As a general rule agents appointed by the Company represent it not only for armament sales, but for other commercial products of the Company, and in some cases, they act also for a number of Companies in the Vickers Group. A copy of the last issue of the Group "Directory of Foreign Representatives and Overseas Arrangements" is supplied for the information of the Commission.

In regard to remuneration, the general practice is that the agents are paid on a commission basis, commission only being paid on orders received through their agencies and upon payment being received by the Company. In certain cases the agent is given a fixed annual sum or minimum commission, and also in many cases his out-of-pocket expenses, such as cost of cables, travelling, etc., are refunded. A copy of the standard form of agreement with agents is attached.*

In regard to the agent's activities his chief function is to keep the Company informed of armament requirements in his particular country, as and when he learns that the Government of that country is considering or has decided to make purchases. It is not his function to endeavour to create a market for armaments, nor is it the wish or practice of the Company to encourage agents to work on this basis. The agent is expected when called upon to be in a position to advise the Company on matters of local finance and general contract arrangements. He has also to submit tenders on behalf of the Company, such tenders being prepared here and forwarded to him for transmission to the Government concerned. Where information is received from an agent as to a Government's requirements, the final decision as to whether or not a tender will be forwarded is made in London, and if it be decided to tender and the programme is a considerable one, it is the practice of the Company to send technical and commercial experts to discuss with the officials of the Government concerned matters of design, technical data and contract terms, and in such cases negotiations for the contract are carried through by the agent with the advice and assistance of the Company's own representatives.

It frequently happens that foreign Governments interested in a particular type of armament material request that demonstrations of the Company's products should be made to them in such cases, where circumstances appear to justify the expenditure, the necessary material is sent abroad accompanied by technical experts for the purposes of demonstration, but such demonstrations are only carried out where the Company has reasonable grounds for being satisfied that the country concerned has decided to purchase such material. In no case are demonstrations arranged for propaganda purposes. Similarly the Company gives demonstrations of its material in this country at the request of missions from foreign Governments who are sent here by their Governments for the purpose of inspecting and reporting on the products of the Company.

It should be mentioned also that cinematograph films are taken of trials and demonstrations primarily for record purposes, but these are used occasionally as an alternative to a demonstration of the actual product. They are sometimes sent to the agents upon request for specific purposes.

It is also pointed out that in no case does any foreign agent of the Company carry stocks of armament material.

(c) *CIRCULATION OF PAMPHLETS AND LEAFLETS.*

The Company prepares pamphlets and leaflets descriptive of the characteristics of its various products and giving the requisite technical and other data with regard thereto, these being issued to agents abroad with the object of providing them with such general information as will enable them to deal with any question raised by the Governments of their respective countries.

These pamphlets and leaflets, of course, are only issued in the case of products which the Company is not precluded by the British Government from selling abroad, and in no case are they issued broadcast. Copies of typical examples of these pamphlets are attached hereto.*

(d) *SOLICITING FOR ORDERS.*

The selling arrangements of the Company being as outlined above, it is emphasised that there is no general practice of soliciting for orders for armament material. Only where it is definitely known that the Government is in the market for a certain type of material, and where the agent of the Company concerned so recommends, does the Company send representatives, technical or otherwise abroad.

During the last five years one journey abroad was made by a Director of the Company, that being the tour undertaken by a Director in 1932 to the Baltic Countries, the object then being to visit the agents in the countries concerned with a view to bringing their information up-to-date, and to inspect their agency arrangements. On another occasion two directors proceeded to a North European country in connection with a definite enquiry, while in 1931 a director visited Canada purely in connection with the Company's commercial interests.

VICKERS LIMITED.

Vickers Limited being the parent Company of the Group has to a very limited extent carried out certain press advertising. The amounts expended in this direction, and the names of the papers in which the Group advertisements appeared are shown in the Schedule attached.†

Typical examples of advertisements are attached,* from which it will be seen that they are of a general nature, and not specifically relating to armament material.

The Company also prepares for distribution to agents and clients a booklet entitled "Vickers Limited and its Interests", a specimen of the last issue of which is appended.*

A special publication entitled "The Flag that Trade follows" was prepared in connection with the Canadian National Exhibition, and a specimen of this is enclosed. The cost of these two booklets is included under the heading of Group Advertising in the Schedule referred to above.

On the other hand this Company during the last five years has expended the sum of approximately £14,000 on advertising in the press in connection with the Annual General Meeting, and this, together with the Group advertisements referred to above (including the two publications mentioned in the preceding paragraphs) constitutes the sole expenditure on advertising by this Company.

Advertising in the foreign press in this direction is undertaken because it is the general advice of the Group's agents that the publication of the information contained in these advertisements is helpful to them in regard to all business, armaments and general, as it gives an indication of the financial standing and strength of the Group.

VICKERS (AVIATION) LIMITED.

THE SUPERMARINE AVIATION WORKS (VICKERS) LIMITED.

A. ADVERTISING.

(i) *Press and Sundry Advertising.*

The amounts expended during the last five years in connection with space in journals and catalogues,

* Not reproduced.

† See p. 412.

* See p. 410.

and on diaries and playing cards which are distributed annually, are shown hereunder:—

Foreign	167	124	54	47	113

The following list will give an indication of the class of journals in which advertisements have appeared:—

Aircraft Engineering.
Aircraft Engineering Buyers Gazette.
Aircraft (Australia).
Army Navy and Air Force Gazette.
Air Annual British Empire.
The Aeroplane.
Jane's All the World's Aircraft.
R.A.F. Programme (Hendon).
R.A.F. Programme (Heliopolis).
R.A.F. Quarterly.
R.A.F. Milton Stores.
R.A.F. Fourstore Sports Club.
Flight.
Royal Aeronautical Journal.
Vickers News.
Wings (New Zealand).
The Times Trade Engineering.
R.A.F. Cranwell College Journal.

With regard to foreign advertising the Companies act on the advice of their Agents and such advertisements, with few exceptions, have been confined to the Technical Press.

The sundry advertising consists in the distribution of diaries and playing cards, and is comparatively unimportant.

(ii) *Exhibitions.*

The names of the exhibitions in which the Aviation Companies have participated during the five years in question are given hereunder:—

Name of Exhibition.	Material Exhibited.
Vickers (Aviation) Limited	Buenos Aires Aircraft accessories sampleStreamline wires, models of aircraft, photographs, illuminated transparencies, cinema films.
Paris ...	Do.
	Note.—The "VILDEBEST" machine was demonstrated at the Aerodrome.
Canada ...	Aircraft accessories, etc.
	Photographs.
Copenhagen	Aircraft accessories.
Milan ...	Do.
The Supermarine Aviation Works (Vickers) Limited	Antwerp ... Schneider Trophy Machine.
Paris ...	Models of aircraft and illuminated transparencies, cinema films.
Buenos Aires	Models of aircraft, cinema films, photographs, etc.
Canada ...	Schneider Trophy Machine and models of aircraft.

B. *SELLING ARRANGEMENTS.*

Home.—With regard to sales to British Government Departments, the methods followed by the Aviation Companies are, and must necessarily be, analogous to those employed by Vickers-Armstrongs Limited.

Abroad.—Local Agents are appointed as necessary. As in the case of Vickers-Armstrongs Limited, Companies or individuals of high standing are appointed and, indeed, in many cases the Agent of Vickers-Armstrongs Limited also represents the

Aviation Companies. The Agents are remunerated by a commission on sales with the addition, in some cases, of an allowance for expenses. In one or two cases in the past a salaried employee with technical knowledge has been attached to the office of the agent, but there is now only one official so employed. A copy of the standard form of Agency Agreement is attached.*

The Agent's duty is to report on the types of aircraft which the Government of the country, for which he is the Company's representative, has decided to purchase. If the types approximate those in manufacture at the works of the Aviation Companies the Agent is then supplied with complete specifications, prices and delivery dates, and it is left to him to advise the Company on matters of finance and contract arrangements, and to negotiate the sale.

As in the case of Vickers-Armstrongs Limited, the decision as to whether a tender shall be submitted is made by the Head Office of the Companies.

Occasionally, at the request of the Agent, representatives of the Companies are sent to advise on technical and commercial matters and to collaborate with the Agent in his negotiations.

In the years 1930/32 two or three demonstration flights were undertaken. The Chinese Authorities requested Vickers (Aviation) Limited to send a "VESPA" Machine to Shanghai for demonstration and issued a permit for its importation.

In 1931 a pilot of the Company flew a machine to certain Baltic countries, this tour being undertaken on the advice of the Agents, while in 1930 a "VELLORE" freighter was flown to Australia with a view to demonstrating the utility of that machine for carrying heavy loads over long distances.

C. *CIRCULATION OF PAMPHLETS, LEAFLETS, ETC.*

Generally when a new type of aircraft is produced and adopted by the Royal Air Force an illustrated catalogue is prepared, giving its main characteristics. Similarly, catalogues of the large number of Accessories made by Vickers (Aviation) Limited are compiled from time to time. Copies of such catalogues are sent to the Agents to enable them to deal with enquiries from their respective Governments, but it is emphasized that they are not issued indiscriminately. It may be mentioned that the Accessories referred to are supplied for civil as well as military aircraft.

A copy of a typical Catalogue, that dealing with the Vickers "Vildebeest", is enclosed.

D. *SOLICITING FOR ORDERS.*

There is no general practice of soliciting for orders. As has been noted above, when it is known that a Government is in the market for a type of aircraft which the Aviation Companies can supply, and when the Agent so requests, the Companies may send representatives abroad to assist in the negotiations.

THE WHITEHEAD TORPEDO CO., LIMITED.

It is unnecessary to enter into any great detail with regard to this Company.

The advertising undertaken by it is negligible, as will be seen from the figures quoted hereunder:—

	1930	1931	1932	1933	1934
Home	£85	£38	£110	£124	£114
Foreign	Nil	Nil	Nil	Nil	90

The foreign advertising in 1934 covered paragraphs inserted in two Technical Journals and was undertaken at the express desire of the Agents concerned.

This Company publishes no catalogues and undertakes nothing which can be described as sundry advertising.

The remarks regarding the selling arrangements of Vickers-Armstrongs Limited apply generally to this Company. The assurance is given that The Whitehead Torpedo Company, Limited, has no system of soliciting for orders, negotiations being initiated only upon receipt of a definite enquiry from a Government. Representatives are not sent abroad except on the express invitation of the Government concerned.

THE THAMES AMMUNITION WORKS LIMITED.

It is unnecessary to deal with this Company since for its Armament productions it acts only as a sub-contractor to Vickers-Armstrongs Limited.

* See p. 412.

STANDARD AGENCY AGREEMENT VICKERS-ARMSTRONGS, LIMITED

MEMORANDUM OF AGREEMENT made this
day of
thousand nine hundred and one
Between VICKERS-ARMSTRONGS LIMITED whose
Registered Office is situate at Vickers House
Broadway Westminster in the County of London
England (hereinafter referred to as "the Com-
pany") of the one part and
of
(hereinafter referred to as "the Agent") of the
other part.

Whereby it is mutually agreed as follows:—

1. The Company hereby appoint the Agent and the Agent hereby agrees to act as their sole Agent in the Territory comprising

(hereinafter referred to as "the Territory") for the sale of their Products as defined in the Schedule "A" attached hereto which shall be considered as forming part of this agreement or any other product which may from time to time be notified by the

Company to the Agent in writing and all of which products are included in the expression "the Products" whenever hereinafter used.

2. This Agreement shall be deemed to have commenced on the day of 19 and subject as hereinafter provided shall continue for a period of year(s) and thereafter unless and until determined at the end of the said year(s) or at any time thereafter by months' previous notice in writing given by either party to the other subject however that in the event of the Company deciding to cease the manufacture of any product named in Schedule "A" attached hereto the Company reserve the right to cancel and exclude such item from this Agreement by giving to the Agent notice in writing at any time.

3. The Agent undertakes to use his best endeavours to promote and obtain orders for the sale of the Products and may obtain enquiries from any source whatsoever in the Territory but shall not

knowingly sell the Products for delivery outside the Territory. The Agent shall wherever possible when forwarding such enquiries or orders send full particulars including drawings and specifications of requirements necessary to enable the Company to prepare tenders or to proceed with the execution of the order with the least delay but the Company in their discretion shall have the right to decline to submit a tender on any enquiry or to accept any order.

4. The Agent during the currency of this Agreement shall not represent or be interested directly or indirectly in any manner whatsoever in any business firm or company manufacturing or selling products of a similar nature to or likely to compete with those covered by this Agreement without the Company's previous written consent.

5. The Agent shall unless otherwise directed retain in his possession all correspondence or other documents sent him by the Company and shall not at any time hereafter divulge any information in relation to the Company's affairs or business or method of carrying on the same.

6. The Agent shall keep up-to-date records of all enquiries transactions and proceedings concerning the business of the Agency and shall from time to time upon request by the Company supply to the Company periodical or special Reports Returns or other information.

7. The Agent shall not and shall not be deemed to have authority to incur any liability or in any way pledge the Company's credit or accept any order or make any Contract binding on the Company without the Company first approving the terms of such order or contract and the Agent having received in writing in the latter case the necessary authority thereafter to sign such contract.

8. The Company reserve the right to themselves at all times to deal direct with any enquiry emanating from the Territory and/or for ultimate delivery into the Territory received by them through financial connections or other connections of whatsoever nature and in the event of orders being accepted by the Company as the result of such enquiry the commission (if any) payable to the Agent shall be in the sole and absolute discretion of the Company.

9. Subject to the due observance and performance by the Agent of the provisions herein contained and on his part to be observed and performed and subject as herein provided the Company will credit the Agent with Commissions at the rates specified in Schedule "A" attached hereto upon the sales of the Products the orders for which emanate from and the ultimate deliveries of which are made into the Territory to be calculated on the net amounts received by the Company for those sales excluding the cost of all packing carriage ocean freight insurance Customs Duties or other charges.

10. The Company will as soon as possible after the last days of March, June, September and December in each year furnish to the Agent an account showing the Commission credited to him for the quarter immediately preceding and will remit or credit payment therefor as soon as possible thereafter provided always that no Commission shall be credited to the Agent unless and until payment for the Products shall have been actually received by the Company but in cases where the Company receive instalments of the sales price the Commission shall be credited to the Agent in proportion to and as and when the Company receive cash.

11. In the event of a Contract being cancelled owing to circumstances beyond the control of the Company or the price for such Contract being modified in any way whatsoever the Agent shall be credited with Commission only on such sums as are actually received and retained by the Company in respect of such contract. Where Compensation is received by the Company in respect of any cancelled Contract the Agent shall be credited with Commission on the net amount received and retained by the Company less the deductions provided for in clause 9 hereof.

12. In the event of any moneys due to the Company being paid direct to the Agent or if the Agent shall collect such moneys on behalf of the Company the Agent shall immediately remit such moneys intact to the Company or as the Company may direct. The Agent shall not be entitled to deduct from such moneys nor from any amount due by the Agent to the Company any Commission or expenses claimed by the Agent.

13. In the event of the Products the order for which emanated from outside the Territory being delivered outside the Territory for ultimate delivery into the Territory the Agent shall only be credited with one half of the Commissions provided for in Clause 9 hereof.

14. No commission will be paid on any Order received after the termination of this Agreement notwithstanding that the Agent may have been concerned in or responsible for initiating the said order or whether quotations had been submitted during the period of the Agency or not and upon the termination of this Agreement by effluxion of time or otherwise a List of Orders outstanding to that date for the Products upon which the Agent is entitled to Commission shall be supplied to the Agent by the Company and in the event of the Agent failing to notify the Company of his acceptance of such List within thirty days after its receipt the Agent shall be deemed to have accepted such List. In the event of the Agent disagreeing with such List the Agent shall notify the Company of the reason for such disagreement within the said thirty days and failing agreement within a further thirty days the dispute shall be settled by Messrs. Deloitte Plender Griffiths & Company or other Auditor for the time being of the Company in accordance with clause 15 hereof. The Agent shall notwithstanding such termination be credited with Commission as and when the Company receive payments in respect to the Orders in such List. No commission shall be payable hereunder after such termination otherwise than in respect to the Orders included in the List.

15. In the event of any dispute as to the accuracy of a Statement of Commission or anything contained therein or other account a Certificate signed by Messrs. Deloitte Plender Griffiths & Company or other Auditor for the time being of the Company shall be conclusive and binding upon both parties.

16. The Company will pay to the Agent such expenses as may be included in Schedule "B" attached hereto or which may be sanctioned in writing from time to time by the Company.

17. In the event of the Agent being requested to perform any special duty over and above that required by this Agreement the Company agree to remunerate him as they in their sole discretion think fit.

18. The Company will at their sole discretion forward to the Agent free of charge catalogues and other publicity matter and particulars of new products likely to be of interest in the furtherance of business. The Agent shall distribute these catalogues and other publicity matter as may be directed or otherwise make use of the information in the most advantageous manner.

19. Upon the termination of this Agreement from any cause or at any time previous at the request of the Company the Agent shall return to the Company or otherwise dispose of as the Company may instruct all catalogues samples pamphlets plans specifications or other documents or papers whatsoever sent to the Agent and relating to the business of the Company and which he shall have in his possession or under his control.

20. The Company shall have the right by giving notice in writing to terminate this Agreement forthwith in any of the following events that is to say

(a) If the Agent commits a breach of any of the terms and conditions of this Agreement.

(b) If the Agent becomes insolvent or enters into liquidation whether compulsorily or voluntarily or compounds with his Creditors.

(e) If from any cause the Agent shall be prevented from performing his duties hereunder for a period of three consecutive months or for a total period of six months in any one period of twelve calendar months.

(d) If the Agent shall be guilty of any conduct which in the opinion of the Company is prejudicial to the Company's interests.

(e) If the Agent purports to assign or charge the benefits of the Agreement without the written consent of the Company.

(f) If any hostilities break out or are threatened or there be a revolution in the Territory which would be in the Company's opinion detrimental to their interests.

21. The Company shall not be responsible for acts or defaults of the Agent or those of his employees or representatives.

22. Nothing in this Agreement shall constitute or be deemed to constitute a partnership nor shall the Agent act as a "Principal" in any transaction other than in the disposal of Consignment Stock.

23. The Agent shall notify the Company immediately of any change of address from that referred to in the heading of this Agreement or of any alteration in the constitution of his firm.

24. All previous Agreements and arrangements made between the Company and the Agent are hereby cancelled.

25. All correspondence and Notices to the Agent will be sent to the principal and last known address of the Agent and such correspondence and Notices shall be deemed to have been effectively served if left at or sent by Registered post or transmitted by cable telegraph or wireless telegraphy to the address aforesaid and if sent by post cable telegraph or wireless telegraphy shall be deemed to have been served on the day on which in the normal course of transmission they would be delivered.

26. All communications to the Company affecting this Agreement shall unless otherwise directed be left at or sent to the Registered Offices of the Company as aforesaid.

27. The words "in writing" whenever referred to in this Agreement shall be deemed to mean any communication sent by letter telegram cablegram or wireless telegraphy.

28. Subject to the provisions of Clauses 14 and 15 of this Agreement any dispute which may arise between the Company and the Agent touching the true construction of these presents or the rights and liabilities of either of the parties hereto shall as and when the same shall arise and unless otherwise herein expressly provided be referred to the decision of an Arbitrator in London to be agreed upon between the parties or in default of agreement for fourteen days to be appointed at the request of either party by the President for the time being of the Institution of Civil Engineers and this shall be deemed to be a submission to Arbitration within the meaning of the Arbitration Act 1889 or any statutory modification thereof.

29. This Agreement shall in all respects be construed and carried into effect as a Contract made in England and according to English Law.

IN WITNESS whereof these presents are entered into on the date aforesaid.

STANDARD AGENCY AGREEMENT.

VICKERS (AVIATION) LIMITED.

Dear Sirs,

1. We hereby offer to appoint you our exclusive representatives for the sale of our aviation products (excluding armaments) for the country of on commission terms set out on the attached memorandum from the date hereof until determined (a) on or after the 31st December, 1934, by either

party having given to the other 6 months' previous notice in writing, or (b) forthwith at our option by giving you notice in writing, in the event of your failing to observe the conditions hereunder, becoming insolvent, or going into liquidation, or if you should be prevented for any reason from performing your duties hereunder, or if you should be guilty of any conduct prejudicial to our interests.

2. You undertake

(a) To do your utmost to promote the sale of our aviation products, and not to be interested in the sale in or elsewhere of the aviation products of any other firm without our previous consent in writing.

(b) To refer to us all enquiries you may receive for aircraft and aviation materials of any kind whatsoever.

(c) To report to us at least once a month particulars of any aviation developments in your territory.

(d) To submit only such quotations as we shall give you and not to vary same without our consent; we having the right to refuse any order not in accordance with our quotation.

3. Apart from telegrams necessitated by special and urgent business, or expenditure specially incurred at our request, we are not to be responsible in any way for any expenses you may incur.

4. Nothing in this arrangement shall be taken as giving you authority to pledge this Company's credit or to enter into any contract without their previous knowledge and consent, or as constituting partnership relations between us.

5. On the termination of this arrangement we shall only be liable to pay you commission as and

when it shall become due on orders actually accepted prior to the date of such termination, and shall not be liable for any commission on further orders even though the customer may have been originally introduced by yourselves.

6. You undertake to remit forthwith any sums received by you on account of goods supplied by us.

7. Any dispute which may arise touching the true construction of these presents shall be referred to the decision of an arbitrator in London to be agreed upon between the parties or in default of agreement for fourteen days to be appointed at the request of either party by the President for the time being of the Institution of Civil Engineers and this shall be deemed to be a submission to Arbitration within the meaning of the Arbitration Act 1889 or any statutory modification thereof.

8. The terms of this arrangement are to be construed in accordance with English Law.

9. Your acknowledgement accepting the terms of this letter is sufficient for our purpose to constitute the agreement between us.

Yours faithfully,

For VICKERS (AVIATION) LIMITED,
Secretary.

APPENDIX 10.

STATEMENT SUBMITTED BY THE ENGLISH STEEL CORPORATION, LTD., WITH REFERENCE TO EVIDENCE OF THE UNION OF DEMOCRATIC CONTROL

[NOTE.—To facilitate ready reference to the printed Minutes of Evidence taken before the Commission, of witnesses on behalf of the Union of Democratic Control, the headings and sub-headings (except in Part IV, Chapter 2) as used therein have been taken for the purposes of this Statement.]

In submitting this Memorandum in reply to the Statement of Evidence taken by the Commission on behalf of the Union of Democratic Control, on the 17th and 18th July, 1935, so far as it relates to the Heavy Armament Industry, The English Steel Corporation, Ltd., venture to put forward the following observations, for the consideration of the Commission:

The Statement of Evidence prepared on behalf of the Union of Democratic Control was put before the Commission by the Right Honourable Sir William Jowitt, P.C., K.C., as representative of the Union. As was to be expected from one of his eminence and standing, he frankly admitted in his opening remarks that the Union, whose representative he was before the Commission, was a Socialist body whose views might be coloured by their political and economic convictions (page 137). He further, in reply to a question by the Chairman of the Commission, stated that he was not in a position to call evidence in support of the statements which he was instructed to put in affecting the Heavy Armaments Industry (page 145, col. 1).

In these circumstances, the English Steel Corporation, Ltd., submits that it might well refrain from making any reply to the incorrect and misleading statements put forward by the Union of Democratic Control and the unjust accusations founded thereon.

The English Steel Corporation, Ltd., has, however, out of respect for the Commission, determined to submit the following short reply dealing with some of the points put forward by the Union of Democratic

Control. Unlike the Union of Democratic Control, the English Steel Corporation, Ltd., is in a position to produce evidence in support of its Memorandum, and would welcome the opportunity of doing so, should the Commission consider this necessary.

PART III.

THE FINANCIAL ASPECTS OF THE ARMAMENT INDUSTRY.

On page 169, col. 1, the Union of Democratic Control, referring to the purchase of nickel, indicates a procedure which it is suggested could be followed to inflate prices artificially and show several profits arising from the one transaction. In practice no such procedure exists.

It is also stated that the nickel rebate is concealed from the Government at the point where the nickel in its raw state is sold to E.S.C. This is not so. The matter is more fully dealt with later in this reply in the comments on nickel.

In the next paragraph reference is made to various firms which are alleged to be part of the Vickers Group, and which have a number of directors common to all, and it is stated that these directors will have fees from each concern. It may be of interest to the Commission to learn that within the Vickers Group no director or official who sits on the Boards of subsidiary or associated companies, or companies in which the Vickers Group has a controlling financial interest, is allowed to retain any of the directors' fees in respect of such appointments.

PART IV.

THE ARMAMENTS AND MUNITIONS INDUSTRY.

Chapter 1.—The Iron and Steel Industry.

(a) Geographical. (Page 171. Col. 1.)

Under this heading it is stated that apart from the coal of South Yorkshire being very suitable for steel making, Sheffield has no economic advantage in the production of high grade steels over the remainder

of the country. Proximity to suitable coal is a very important factor, as will be apparent when it is realised that in the Sheffield Works of English Steel Corporation 295,000 tons of coal are used in a year against only 55,000 tons of pig iron. The weight of steel products delivered to customers is 100,000 tons. In addition every practical manufacturer knows that staff and labour facilities are of the utmost importance and in Sheffield a large proportion of the population is by tradition and inheritance steel-minded. From the metallurgical point of view, Sheffield's scientific and technical standing in the world is unquestioned.

(b) *Technical.*

On page 172, bottom of col. 1, an example is given of the composition limits said to be used for gun tubes made from nickel chromium steel, the limits being given as follows:—

	<i>Per cent.</i>
Carbon	·36 to ·37
Silicon	·12 to ·15
Manganese	·60 to ·70
Nickel	3·5
Chromium	·25

and it is further stated that the steel would be rejected as unsuitable for gun tubes if found to be outside these limits, whereas the commercial steel would pass if say the carbon content were ·40 per cent. This is incorrect. The steel used for gun forgings is generally the same as E.S.C. Vibrac V.30, Nonbrit, or Super V.N.C.A., and the limits are necessarily just as rigid for commercial work as for armaments, owing to the highly stressed nature of the articles for which such steels are supplied. Actually commercial steels, particularly of the air hardening variety, are frequently made to even closer limits of composition than those actually stated in Service specifications.

In the next paragraph, it is said "It is seldom that an ingot is passed on to another department without being cooled to an almost atmospheric temperature." This is not correct as regards the manufacture of many grades of highly alloyed steel as the risk of defects is greatly reduced by taking an ingot hot from the mould to the re-heating furnace.

This point is of importance in considering the practicability of segregating the manufacture of armament steels as the steel melting has to be synchronised with the availability of the annealing and re-heating furnaces, and in view of the long time the ingots are in these annealing furnaces (from 24 hours to three weeks) it would be impracticable economically to deal with the whole of the output from the melting furnaces in this manner. It is essential to have an outlet for the balance of the steel melted. Private enterprise gets over this difficulty by disposing of the surplus steel in the form of commercial ingots and rolled products.

Production of Armaments.

On page 173, col. 1, it is suggested that the use of Swedish pig iron is practically confined to steels intended for armaments purposes. This is not correct as much of the Swedish pig purchased is used in commercial steels for products such as pipe moulds, electrical rotor forgings, etc. Even in armaments steels a considerable portion of the pig iron used is British.

At the foot of col. 1 comments are made regarding the effect of manganese in gun steel and though the point is not perhaps of great importance, the statements are entirely incorrect. The non-warping and non-shrinking steels containing manganese are in an entirely different category to nickel-chromium-molybdenum steels, the chief functions of manganese in the latter type being to de-oxidise the steel prior to casting, and to combine with the sulphur which is present in all steels as an impurity.

At the end of the same paragraph an example is given of the average composition of armour plate steel, but this example is obviously based on the practice of years ago and is given apparently without knowledge of modern practice.

It is also stated on this page (col. 2, para. 2), that "it is after the ingot stage that arms steel . . . passes through certain operations which definitely separate it from the commercial steels." This is not correct, as for example, the forging operations for a large alloy steel shaft and a moderate size gun tube are identical and the same precautions during heating and cooling have to be taken in both cases.

The above examples are sufficient to indicate that the Union of Democratic Control is inaccurate in its technical evidence, and particularly in its contention that armament steels are entirely different from commercial steels. In fact the use of highly alloyed steels is increasing very rapidly and, as will be shown, the same types of steel, especially nickel-chromium-molybdenum, are used for both armament and commercial purposes.

On page 174, col. 1, in referring to E.S.C. it is stated that the "lathes" (presumably more than merely lathes is meant) required for gun manufacture are unsuitable for commercial work and *vice versa*, and it is inferred that machines relatively slow and therefore more costly in operation are used in gun manufacture. This is not the case and with the exception of rifling machines which are exclusively used for guns, modern efficient machine tools are suitable for either gun or commercial work. The fact that many old machines have been replaced by modern tools is merely part of the policy of modernisation which has been carried out during the past three years and which is still in progress. The resulting economies in production costs are of course of benefit to the consumer, irrespective of whether the product is armament or commercial. The finish demanded for commercial work is quite as high as for guns, and an assurance has been given to the British Admiralty that in these machines, at present engaged on commercial work, E.S.C. retains the equipment necessary for the efficient manufacture of guns in time of national emergency.

Then in speaking of the armour plant at Cyclops (page 174, col. 2) it is stated that last year it was opened out for cleaning and overhauling on the granting of a sum of £5,000 from the Government and further that it is now maintained in working condition by a Government grant of £1,000 per annum. No grant of any kind has been made by the Government nor has any application been made by E.S.C. for such assistance. Periodic overhaul and continual maintenance is necessary to maintain the plant in suitable condition for operating should this be necessary at any time to implement the undertaking to the Admiralty that E.S.C. will maintain sufficient plant for a specified maximum output capacity.

The inaccuracies in the division of departments between those wholly engaged in armament work and those only partially employed on such work are probably of little importance but it is stated, under the heading of "Service Departments" (page 175, col. 1) that the so-called armaments departments are practically self-contained as regards services such as hydraulic and pneumatic power, gas, water, steam, etc., and that a withdrawal of armament work would involve no appreciable increase in the cost of such services. Actually the reverse is the case as the various services are for the most part common to all departments and the withdrawal of any class of work would inevitably mean a greater burden of service charges to be borne by the remaining products.

Chapter 2.—The Heavy Armaments Industry.

In this chapter considerable insistence is laid on the fact that the steel companies engaged in the manufacture of armaments are interested—either by themselves or with others—in the provision of certain essential raw materials, and particular mention is made of pig iron, nickel, silica bricks and electrodes.

Pig Iron.

The reference to the interest of the Darlington Forge Ltd., in Carnforth, is misleading, as the

percentage used of pig produced by Carnforth was almost negligible, and in any case it has not produced pig iron since a date prior to the Darlington Forge being taken over by English Steel Corporation. E.S.C. could not, therefore, be considered to be interested, and as a matter of fact it (in common with many other steel companies) purchases its requirements in the open market.

Nickel.

There are only two main sources of supply of nickel, viz.: Canada and New Caledonia. In the early days of the use of nickel, the latter deposits—which are controlled by French interests—were relatively much more important than is the case today. Nowadays for all practical purposes the International Nickel Company of Canada can be regarded as a monopolist.

When nickel was first used in steel the French were the principal suppliers. It was therefore essential to safeguard the requirements of the British steel makers, and this was the reason for the formation of the Steel Manufacturers' Nickel Syndicate which made an agreement with the French suppliers. The reason why the armaments firms are the only British members is, of course, that in the early days very little nickel was used in steel works for any purpose other than armament steels (principally armour plate). The position is very different now, and it may be of interest to know that so far as the British members of the Syndicate are concerned less than 20 per cent. of their nickel purchases are used for armament steels.

The Syndicate now exists solely in order to secure the benefits to be derived from collective buying, and a sliding scale of rebates is in operation based on the total purchases of the members. The Nickel Syndicate makes no profit, the full amount of the rebate being passed on to the individual members. The statement by the Union of Democratic Control that such rebates are concealed from the Government auditors is totally incorrect.

The evidence may have been intended to imply that a purchasing arrangement of this nature tends to inflate prices and is evidence of inefficient buying. Actually the contrary is the case, as the terms secured by the Syndicate are more favourable than can be obtained by other British producers negotiating as individual firms in the open market, and the benefit of the arrangement accrues to the Government in so far as armament products are concerned.

Silica Bricks.

It is true that English Steel Corporation holds 39,000 of the 177,500 shares in The Oughtbridge Silica Firebrick Co., Ltd., but E.S.C. has no interest in the Parkgate Iron & Steel Co., although the evidence states that their interests in this Company through Vickers give them another 19,500 shares. The Oughtbridge Company has no concern with armaments, and the bricks are used for the lining of steel furnaces irrespective of the class of steel being manufactured.

Electrodes.

Electrodes are used in certain types of electric furnaces, and in the early days this country was entirely dependent on imported electrodes. During the War, at the request of the British Government, a number of Sheffield steel manufacturers formed a company for the purpose of manufacturing electrodes, as the previous sources of supply from abroad were not available. With the increasing severity of engineering specifications the use of electrically melted steel has developed considerably and is likely to continue to do so. In these circumstances it is of the utmost importance that there should be a supply in this country of suitable electrodes.

It is only in recent years that electric steel has been used for armament purposes, and the proportion is still very small.

High Speed Steel Alloys, Ltd.

This Company was formed in 1914, at the request of the Government, on the outbreak of the War, by

a combination of 31 makers of high speed steel. At that time there was no factory in the United Kingdom producing tungsten which had up to the outbreak of hostilities been purchased entirely from Germany, and the first consideration of the Company was to manufacture tungsten metal—an essential ingredient of high speed tool steel. After the War production of tungsten, vanadium, and molybdenum was placed on the list of key industries and the post-war activities of H.S.S. Alloys, Ltd., have been gradually extended to cover these and other essential alloys. The work of this Company has been of enormous importance in developing the use of alloy steels with resulting advantages in a variety of ways, particularly to the automobile, aircraft, chemical and general engineering industries.

The shareholders are not all engaged in the manufacture of armament steels, and only a very small proportion of the products of the Company is used for this purpose.

The High Speed Steel Mining Company, to which reference has been made, exists for the purpose of mining wolfram ore for the subsequent production of tungsten.

Why such things as the manufacture of electrodes and silica bricks and the arrangements which exist for the provision of commercial alloys should be linked with the manufacture of armaments, is by no means clear, but presumably the intention was to find support for the unfounded allegations of a sinister armaments ring by showing that in certain directions of only secondary importance the makers of armament steels have points of common interest.

There would appear to be a regrettable inability to appreciate that perfectly normal and innocent commercial arrangements can be entered into by armaments manufacturers without dishonesty of purpose. Incidentally it may be pointed out that these arrangements are greatly in the national interests.

PART VIII.

THE PRACTICABILITY OF THE PROHIBITION OF THE PRIVATE MANUFACTURE AND TRADE AND THE INSTITUTION OF A STATE MONOPOLY.

No detailed technical attempt has been made to show how nationalisation could be achieved and the very real and practical difficulties have been entirely ignored.

Take, for instance, the suggested segregation of armaments steels in a state-owned steel works. On page 206, col. 2, it is stated that the differences between the production of steel for armaments and that for commercial products start from the time the raw metal is placed in the furnace, and it is later argued (page 207, col. 2) that it would be economical to separate the manufacture of armament steels from that of commercial steels. As an example of the inaccuracy of this statement it may be stated that Vibrac and Nonbrit steels (both products of E.S.C.) are used for torpedo air vessel forgings and also for certain classes of high tensile gun forgings, while their commercial uses include such things as locomotive connecting and coupling rods, mandrel bars for the Pilger process, high pressure reaction vessels, and crankshafts, axleshafts, gears and many other parts for the automobile industry.

Similarly the composition of E.S.C. bullet proof plates is the same as their super V.N.C.A. steel.

These are merely typical examples to show that there is no essential difference between many types of armament steels and those used for commercial products, and as a matter of fact the nickel-chromium-molybdenum type of steels is now used more extensively for commercial than for armaments purposes, the compositions of the steels being in very many cases identical or so similar that one could be substituted for the other. In these circumstances it will be appreciated that the development of these special steels can much more readily be carried out in a works dealing with both commercial and armament steels than could be the case if armament steels alone were being made. Not only

so, but having regard to the preponderance of commercial work it is fair to say that the technical development in these steels is in considerable measure due to their commercial applications.

On page 206, col. 2, it is stated that the segregation of armament steels should include the manufacture of castings for turbines, gun mountings, etc., and ship castings. It would be quite impossible without supplementary commercial work to provide a foundry capable of supplying these articles and maintain anything like reasonable continuity of employment. Not only would the skilled personnel frequently be idle for long periods but the cost would be anything but economical.

LOSSES DUE TO THE JOINT MANUFACTURE OF ARMAMENT AND COMMERCIAL STEELS IN PRIVATE FACTORIES.

Under the headings of technical losses and commercial losses, serious criticisms are made of the lay-out and general control of E.S.C.

It is regrettable that general statements of this kind should be put forward without evidence being produced in support of them.

1. Works layout.

Under the heading of "Works layout" it is said that the River Don—

(1) Provides a supply of cheap water. This is agreed.

(2) Is a barrier to efficient works layout and a hindrance to internal transport. This is not correct as adequate communication is obtained by means of bridges to the two departments which are on the south side of the river. In any event the comment is irrelevant as the whole of the armament steel plant is on the north side.

(3) Is in annual flood. This also is incorrect and no serious flooding has occurred for some years.

Also the statement "that E.S.C. have spent over £1,000,000 this last two years on new plant and buildings, but it has been a policy of tackling the different manufacturing units one by one without due regard being paid to the whole," is not in accordance with the facts. No responsible Board of Directors lightly embarks upon such large expenditure of shareholders' money. The suggestion may be regarded by the Commission as being of importance in that it bears on the efficiency or otherwise of the private contractor, and therefore it may be as well to state now that no new expenditure has been incurred without the Directors being satisfied that the project concerned fitted into the complete scheme of reconstruction.

2. Administration.

Steel firms do not claim that administration on armament steels is greater than on commercial steels of the same type. What they do claim is that the administration necessary for special steels, which comprises both armament and commercial steels, is greater than for low grade steels, because the special steels pass through so many and varied operations and elaborate precautionary measures are essential at all stages, resulting in costly technical control.

The deciding factor in cost of administration is the number and variety of operations and not the range of products. There is, therefore, no justification for stating that segregation of armaments steels would reduce the administrative difficulties.

Vickers Limited, being a Holding Company, has (beyond a very small expenditure on group advertising) no selling costs and, therefore, it is inaccurate to suggest that the prices charged to the Government for armament steels include any provision whatever for such selling costs.

3. Material control.

The comments under the heading of "Material control" (page 207, col. 2), are made with insufficient knowledge of the problem. There is no difficulty in a well-organised works in separating and controlling the various types of scrap and materials and there is certainly no necessity to limit the number of brands on this account. The

absurdity of remelting steel a few months old because records are expensive to maintain in an up-to-date condition will be appreciated when it is realised that the average value of steel stocks at E.S.C. is nearly £300,000 while the cost of keeping accurate and up-to-date records is only a matter of £2,000 per annum at the most.

4. Compromise in plant.

Similarly the remarks regarding "Compromise in plant" (page 207, col. 2), and the conclusions drawn therefrom show a lack of understanding of the problems confronting the manufacturer of special steels. In the first place the manufacturers of high class armament steels do not make the cheaper commercial steels, as is inferred, and consequently the comment as to the absurdity of such a procedure is entirely irrelevant.

It must be understood that as armament and general engineering steels are produced in the same steel-making plant, an advanced technique must be applied which permits the employment of the latest physical chemistry of steel reactions. Such conditions involve increased costs which the market prices of the cheaper steels could not carry. A large electrical rotor shaft is in its way as important as a large gun tube, and the steel of which these and other large and small forgings are made must obviously have the advantage of the best technique. Thus whether E.S.C. steels contain special alloys or not, they are on an entirely different plane to the millions of tons of cheaper steels which constitute the bulk of the country's steel production.

The layout of the works and the size of the melting furnaces and other plant must have regard to the varied products which have to be produced. The size and running costs of the melting furnaces could not be reduced if only armament steels were being manufactured, and indeed the Union of Democratic Control themselves suggest (page 209, col. 2) that a State-owned factory would probably be equipped with open hearth steel melting plant of approximately the size of the present E.S.C. plant. This in itself is not in accord with the statement that armament steels are burdened unduly with the cost of equipment for commercial products.

The manufacturing procedure and consequently the physical movement between departments varies for each job, and while one product may require no special heat-treatment another may require as many as three or four at different stages of manufacture. It will be appreciated, therefore, that efficient layout must have regard to concentration of operations and that the products do not lend themselves to a straight run-through on mass production lines.

This would still be the case if only armament products were being manufactured, and the fact that transporting material between certain departments involves crossing a road (page 207, col. 1) is of no moment as crossing a road is no more difficult than crossing a yard. Incidentally the Union of Democratic Control themselves say there is no reason (page 171, col. 2) why specialisation should not be carried further if desired, and presumably this means specialisation by concentration on processes or operations.

5. General Inefficiency.

It is stated that the rapidity with which works were closed down (page 208, col. 1) cost thousands of pounds, but it would be more correct to say that thousands of pounds were saved by such action. It is incorrect, however, to say that the Penistone Works were closed down overnight. The closing down process actually took over three months to complete. To turn the stocks of raw materials into ingots would obviously have been unwise having regard to the fact that the businesses for which such ingots could be used were being given up.

Specific reference is made (page 208, col. 1) to the motor car crank department and it is stated that machines were moved from Attercliffe to Grimesthorpe at a cost of not less than £15,000 and later moved to the East Machine Shop again at a cost of thousands. The first move was necessary on account of the Attercliffe Works being sold, and the cost

of the removal was £2,811, which expenditure was catered for in the selling price of the works. The subsequent transfer, which was part of the complete scheme of reconstruction, cost £1,557.

Page 208, col. 1. It is true that some years ago consideration was given to the possibility of erecting an entirely new works in a different part of the country, but the fact that the scheme was turned down is not evidence of inefficiency. On the contrary, it shows that such a line of development has not been overlooked, but has been very fully investigated.

COMMERCIAL LOSSES.

1. Capital losses.

The comments on the state of E.S.C. plant in 1932 (page 208, col. 2) are exaggerated. It is stated that charges were often composed of 25 per cent. scrap and 75 per cent. pig and that as pig iron cost double the price of scrap this is further evidence of the inefficiency of the plant. Mixtures of these proportions were exceptional and were used only for certain casts of steel for a particular purpose. As the cost of pig has been for many years past within a few shillings of the cost of scrap of similar sulphur and phosphorous content, the procedure was justified technically and economically. The furnaces were throughout the whole of their life capable of melting steel with normal proportions of pig and scrap, and in fact did so.

It is inaccurate to say that the works were in a pitiful state. It was known that parts of the works, such as the melting furnaces, required reconstructing, but this was purposely delayed until a complete scheme was prepared. Precipitate action would obviously have been unwise.

Then to say that Cyclops was in no condition to commence the manufacture of armour plate immediately is misleading. The armour plate plant at Cyclops has been maintained in working condition throughout and could always have been started up in ample time to deal with the processes for which it is retained.

Plant does become obsolete whether it be operated by the State or by private enterprise, and the fact that the situation has been effectively tackled is not evidence of inefficiency, but quite the reverse.

2. Budgeting.

It is asked (page 208, col. 2) what budgeting or planning could be carried out at E.S.C. where the annual turnover from 1930 onwards varied from £1,300,000 to £3,000,000. The answer is that annual budgeting does occur and is essential to the successful conduct of any business which depends on obtaining its fair share of trade in competitive markets. It is said that the prices charged to the Government are influenced by costs of production, which is true, but it is inferred that production costs are in turn influenced by the volume of business obtained, which is only half-true. Costing in a steel-works consists very largely of the application of overhead charges and in times of depression the practice is to charge to production only the normal rate of overheads, leaving the unabsorbed balance as a debit against profit and loss. In other words the losses due to depression in trade are borne by the shareholders and not by the customer. The contention of the Union of Democratic Control is, therefore, in this instance as in so many others, definitely incorrect, but it may be pointed out that if armament steels had been made in a State-owned works, the Government would have had to bear the burden of unabsorbed charges which have been carried by the private manufacturer and without the assistance of commercial work the amount would have been very much greater.

3. Depreciation.

Under the heading of "Depreciation" (page 208, col. 2, and page 209, col. 1), it is stated that the rate of depreciation in respect of plant for the manufacture of armament steel cannot be so high as for commercial and it is further stated that since methods of manufacture in armour plate and guns change but little, there is not the same tendency for

machines to become obsolete. Actually manufacturing methods do change as there is continual technical development in armour plate and guns just as there is on commercial work. Armament products call for great accuracy in steel analyses, control of temperature in heat-treatment and close dimensional limits in manufacture, and these factors necessitate the installation of new and up-to-date plant just as frequently as in the case of commercial products.

It is incorrect to say that armour plate plant has a much longer useful life than general machinery. For instance a commercial forging press will last just as long as an armour bending press and a commercial planing machine as long as an armour planing machine. Moreover the opportunities for recovering depreciation are less in the case of specialised plant such as is used for armour, than for general commercial plant. An instance of this is the 12,000 ton bending press at Cyclops Works. This was installed in 1914 at a cost of over £60,000 for dealing with very thick armour plate. Since that date the only ships equipped with armour necessitating the use of this press were "Hood," "Rodney" and "Nelson," and these were the only opportunities for its economical employment.

Machine tools are only a small part of the plant required. The life of individual machines, of course, varies enormously but this is equally true of all plant.

Actually depreciation is not included in production costs and the standard overall rate of $7\frac{1}{2}$ per cent. is that allowed by the Inland Revenue for Income Tax purposes.

4. Associated companies.

Under the heading of "Associated companies" (page 209, col. 1), it is said that last year the management of the machine department in E.S.C. was forced by higher authority to buy certain new lathes from Craven Brothers, although it was a well-known fact that their lathes were vastly inferior in quality and purpose to others which had been offered. This is definitely untrue. Craven Brothers have supplied only a small portion of the new machine tools which have been installed, and the lathes which were purchased from them were chosen in fair competition with other manufacturers.

Reference is also made to the reciprocal trading between E.S.C. and the Stanton Coal & Iron Company, and it is stated that this results in inefficiency in that Stanton coal has been used in certain departments where it was by no means the most suitable, because all coal had to be purchased from this source. This again is incorrect, and in fact over the last five years only 40 per cent. of the total coal requirements has been obtained from Stanton. Very great attention has been paid to the types of coal most suitable for the various items of plant and careful study and investigation over a long period of years has resulted in very complete information being available in this important matter, and Stanton coal is the most suitable for the purposes for which it is used.

5. Monopoly.

In the remarks under the heading of "Monopoly" (page 209, col. 2) details are given of the steel producing plant existing in 1929 at the time of the formation of English Steel Corporation, and comparison is made with the present-day equipment in order to show that E.S.C. would have to seek assistance at a very early stage of an abnormal demand. The comparison, given as it is in numbers of furnaces, is misleading. In the first place the five open hearth furnaces previously in existence at Penistone works are of no importance in this connection, as although they were installed primarily for the production of common shell steel they were used only for the production of tyre and axle steels, rail steel, boiler plate steel and other low grade steels. E.S.C. has given up the business in all these steels with the exception of tyres and axles, the manufacture of which was transferred to Taylor Brothers at Manchester, who have correspondingly increased their melting capacity. A comparison of the number of furnaces is obviously valueless unless the

capacities are given, and it would be no more misleading to accuse a man of having lost money by changing five separate shillings for two half-crowns.

In computing the maximum output to be derived from open hearth furnaces, it is usual to reckon 44 working weeks per year, and on this basis and excluding the Penistone furnaces which have been dealt with, the maximum capacity of the furnaces in existence in 1929 was 270,750 tons per annum. The capacity of the present furnaces is 288,000 tons per annum.

This statement of present capacity does not take into account the plant at Darlington Forge, which is capable of producing an additional 40,000 tons per annum.

The Union of Democratic Control states that the steel producing capacity of E.S.C. and Darlington Forge can amount to no more than 200,000 tons per annum (actually it is well over 300,000), yet shell steel alone demanded 1½ million tons per annum during the later part of the War. It is apparently not realised that the plant of E.S.C. would not be devoted to the production of common shell steel of the type to which the 1½ million tons referred. This would, as in the last War, be obtained largely from basic furnaces of a type totally unsuitable for producing the special armament steels which E.S.C. manufactures.

Page 210, col. 1. Other matters which have been mentioned to support the alleged inefficiency are that E.S.C. has no fuel expert in its employ and "that the maximum efficiency of any of its hydraulic pumps reaches the princely figure of 23 per cent." The truth is that all fuel research comes under the direct control of the Chief Research Chemist, and as regards the hydraulic pumps, it would appear that the information obtained by the Union of Democratic Control is incorrect. The hydraulic installation is modern and gives about 85 per cent. efficiency which is as high as can be obtained from a service of this nature; the installation challenges comparison with any similar plant.

The Union of Democratic Control puts forward such examples (page 207, col. 1) to demonstrate that inefficiencies are inherent in the system of private manufacture. It is submitted on behalf of E.S.C. that the foregoing remarks dispose of the allegations of inefficiency and other inaccurate statements put forward by the Union of Democratic Control.

During the past three years large sums of money have been expended on the reconstruction of the works. The open hearth acid steel making plant

at Vickers works has been entirely re-built and the most modern types of furnaces and appliances have been installed. The plant is admittedly the most up-to-date in the country. The electric melting furnaces are also being replaced with the very latest types of arc furnaces of considerably greater capacity.

The heavy and medium forging plants have already been partially reconstructed and further improvements are now in progress. A large 7,000-ton hydro-electric forging press has been installed and this is the fastest press of its type in the world. Four other presses are being converted to electric drive to increase their speed of operation and consequently their output capacity. In the heat-treatment department improvement has been made and modern town-gas furnaces and automatically controlled electric furnaces have been put into commission. The machine shops have been completely reconstructed and high speed modern machine tools have been installed. Similar improvements have been carried out or are in progress in the drop stamping department, rolling mills, foundry, and other departments, in pursuance of the policy of the E.S.C. to have available a works equipped with the most modern plant.

Research is of considerable importance in highly technical industries such as ours, and concurrently with the development in the works, special attention was given to this phase of the activities of E.S.C. In 1931, Sir J. J. Thomson, F.R.S., did E.S.C. the honour of officially opening the extensions to their research laboratories, which now compare favourably in scientific equipment and personnel with any similar organisation in the country.

In the programme of reconstruction the E.S.C. has never lost sight of the possible requirements of the British Government in times of emergency, and the appropriate Government Departments are fully posted in regard to potential capacity.

The segregation of armament and commercial steels is impracticable and a State-controlled armaments factory with no commercial outlet for its surplus steel, could not economically produce the Government's requirements of armament steels.

Not only so, but the plant necessary adequately to meet the national requirements in time of emergency would be such that, without an alternative commercial market, it would be impossible in normal circumstances to operate it at anything like the percentage of capacity necessary to keep together the highly trained staff and experienced workmen.

APPENDIX 11.

(See Q. 1848).

MEMORANDUM SUBMITTED BY MESSRS. VICKERS LTD.,
RELATING TO THE PLACENCIA DE LAS ARMAS COMPANY,
LIMITED.

The annexed schedules show the profits of the Placencia de las Armas Company, Limited, for the 5 years ended 31st December, 1934. They have been numbered *Appendix 4 (a) Supplementary*, and *Appendix 7 Supplementary* to accord with the numbers attached to the schedules originally submitted dealing with the Group as a whole.

With regard to the details of investments, the Placencia Company holds shares only in *Experiencias Industriales*

S.A. The particulars regarding this holding were included in Appendix 8 to Statement No. 3 enclosed with our letter dated 21st October, 1935.

During the relevant period the whole of the issued capital of The Placencia de las Armas Co., Ltd., of course, was held by Vickers-Armstrongs Limited.

We have now obtained a certificate from the managing director of the Placencia Company to the effect that during the years in question the whole of the deliveries of armaments were made to the Spanish Government directly, or indirectly through La Sociedad Española de Construcción Naval.

J. REID YOUNG.

30th January, 1936.

APPENDIX 11—*contd.*

PLACENCIA DE LAS ARMAS COMPANY LIMITED.

Appendix 4 (a), Supplementary.—STATEMENT SHOWING DECLARED AND ADJUSTED PROFITS FOR THE FIVE YEARS ENDED 31st DECEMBER, 1934, AND AN ESTIMATE OF THE PROPORTION ATTRIBUTABLE TO THE PRODUCTION OF ARMS AND MUNITIONS OF WAR.

	Amount of declared profits.	Add Adjustment of financial transactions.	Adjusted profits.	Proportion of adjusted profits attributable to	
				Commercial.	Armaments.
	£	£	£	<i>Loss.</i> £	<i>Profit.</i> £
1930	6,363	12,510	18,873	1,510	20,483
1931	1,654	4,479	6,133	1,913	8,051

Appendix 7, Supplementary.—PARTICULARS OF AGREEMENTS WITH OTHER FIRMS ENGAGED IN THE PRODUCTION OF ARMS AND MUNITIONS OF WAR.

Date of Agreement.	Working agreement with	Duration of agreement.	Short particulars.
9th May, 1933... ..	La Sociedad Espanola de Construccion Naval.	20 years from 9th May, 1933	Division of Naval and War Office work received by La Sociedad Espanola de Con- struccion Naval from the Spanish Government.

APPENDIX 12.

(See Q. 1867.)

VALUE OF DELIVERIES OF ANTI-AIRCRAFT GUN, 1930-1934.

The value of deliveries made in the years 1930-1934, inclusive, of Vickers-Armstrongs' anti-aircraft mobile equipments for land service and ammunition therefor, was £554,738

Note.—This information relates only to the par-

ticular equipment named. In addition very considerable supplies of other types of anti-aircraft guns, mountings and ammunition were made in the period named for both the British and foreign Governments.

APPENDIX 14.

(See Q. 1889.)

VICKERS-ARMSTRONGS LIMITED.

Attached are lists enumerating foreign inquiries received, but not dealt with, during the years 1931-1935, inclusive.

During these years we have also received verbally a number of similar inquiries, and have declined to submit proposals.

Proposals were not submitted against these inquiries, the reasons in the majority of cases being:—

- (1) The inquirer was unable or unwilling to give the ultimate destination; or
- (2) We were represented in the particular country and preferred to deal with all matters through our representatives; or
- (3) Some of the inquiries were obviously for no particular destination, and the proposals appeared to be required for unsolicited submission to various countries.

NAVAL, 1931.

Reference No.	Date.	Inquirer.	Country.	Material.
C.23137	7.2.31	Okura & Company ...	Japan	Clinometers and Vickers No. 4 flat gauge.

APPENDIX 15.

(See QQ. 1918-1922.)

STATEMENTS SHOWING QUANTITIES OF ARMS, ETC., EXPORTED TO JAPAN, BOLIVIA, PARAGUAY, COLOMBIA, PERU AND ITALY DURING CERTAIN PERIODS, AND THE NUMBER OF RELATIVE EXPORT LICENCES.

JAPAN.

Value of deliveries from September, 1931, to April, 1933 £2419,906

comprising the following supplies:—

420 R.C. equipments and parts

6 Mark VI tanks and spares.

7,411,000 rounds of R.C. ammunition.

24 5-in. equipments and parts.

60,000 rounds of 5-in. ammunition.

18 40 mm. equipments.

104,000 rounds 40 mm. ammunition.

1 predictor.

1 set torpedo control gear.

1 clinometer.

128 Scarff rings.

40 tons bullet proof plates.

2 Bygrave bombing teachers.

50 submarine mines.

2 depth charge throwers and 4 carriers.

No. of export licences obtained to cover these deliveries 41

The contracts for these supplies were obtained between 28th January, 1930, and 16th March, 1933.

APPENDIX 15—*contd.*

BOLIVIA.

Value of deliveries from July, 1932, to December 1934 £425,158
comprising the following supplies:—

Material.

	<i>Supplied under Contract dated</i>
11 105 mm. mountain equipments ...	
7 105 mm. field equipments ...	
24 75 mm. infantry equipments ...	1.4.27

Spare for Vickers-Berthier equip- ments and 75 mm. mountain equip- ments, and sundry supplies ...	8.6.33
Spare for 6-ton tanks ...	8.8.33
100 spare barrels for R.C. guns ...	6.10.33
60 recuperator packings ...	6.1.34
30 recuperator pistons ...	18.1.34
5,000 primers ...	4.4.34
100 R.C. equipments with spares, etc. ...	13.3.34
Spare for R.C. equipments...	17.4.34
2,600 rounds 75 mm. ammunition ...	30.4.34
500 celluloid protractors ...	9.8.34
No. of export licences obtained to cover these deliveries	27

PARAGUAY.

Value of deliveries from July, 1932, to
December, 1934 £79
comprising:—
50 37 mm. belts.

No. of export licences obtained to cover these
deliveries 1

The contract for these belts was entered into on
18th January, 1932.

COLOMBIA.

Value of deliveries from December, 1932,
to July, 1934 £697,695

comprising:—

2 destroyers.

These destroyers were released to us by the
Portuguese Government and sold by us to the
Colombian Government. They were handed over in
Lisbon.

The contract for these destroyers was entered into
on the 12th February, 1934, and they were handed
over as follows:—

First destroyer	23.2.34
Second destroyer	16.5.34

PERU.

Value of deliveries from December, 1932,
to July, 1934 £51,539

comprising the following supplies:—

2 Vickers-Bygrave bombing teachers.

Spare for Vickers-Carden-Loyd light armoured
vehicles.

6,700 cordite charges.

43 6-in. practice shot.

2,200 rounds 3-in. ammunition, and 45 additional
cases.

8,000 rounds 37 mm. ammunition.

300 aircraft bombs.

No. of export licences obtained to cover
these deliveries 8

The contracts for these supplies were obtained
between 14th March, 1933, and 24th October, 1933.

ITALY.

Value of deliveries from September, 1934, to
June, 1935 Nil

APPENDIX 16.

MEMORANDUM RE SHARE CAPITAL OF VICKERS LIMITED.

[See Qs. 1930-1942 and Q. 2539 *et seq.*]

The Company was incorporated on the 17th April,
1867, with an Ordinary Share Capital of £155,000.

From the year 1867 onwards the capital has been
increased from time to time, and at the 31st Decem-
ber, 1924, the issued capital was £20,679,290, repre-
sented as follows:—

	£
(a) Ordinary Shares of £1 each ...	12,315,483
(b) Five per cent. Preferred Stock ...	750,000
(c) Five per cent. Preference Shares of £1 each	750,000
(d) Five per cent. Cumulative Prefer- ence Shares of £1 each (tax free up to 6s. in £)	6,863,807
	<u>£20,679,290</u>

By a Special Resolution of the Company passed
17th December, 1925, confirmed 5th January, 1926,
and confirmed by the Court on the 26th January,
1926, the issued ordinary share capital was reduced
by £8,210,322 by writing down the shares from £1
each to 6s. 8d. each, leaving the present issued share
capital:—

	£
(a) Ordinary Shares of £1 each ...	4,105,161
(b) Five per cent. Preferred Stock ...	750,000
(c) Five per cent. Preference Shares	750,000
(d) Five per cent. Cumulative Prefer- ence Shares of £1 each (tax free up to 6s. in £)	6,863,807
	<u>£12,468,968</u>

APPENDIX 16—*continued*.

Summarised, the Share Capital of the Company has been issued as follows :—

	£	£
(a) <i>For Consideration other than Cash.</i> —		
(1) Purchase of Assets and Goodwill of Naylor Vickers & Co.	150,000	
(2) Purchase of Assets and Goodwill of Maxin Nordenfelt Guns & Ammunition Co., Ltd.	933,334	
(3) In exchange for shares of Wm. Beardmore & Co., Ltd.	389,500	
(4) Purchase of Interests in Metropolitan Carriage & Wagon Co., Ltd., and W. T. Glover & Co., Ltd.	7,927,702	
		9,400,536
(b) <i>For Cash</i>		8,883,754
(c) <i>As Bonus</i> —		
(1) Issued out of Profits	254,558	
(2) Issued out of Premium on Shares of various issues... ..	1,100,000	
(3) Issued on increased valuation of Goodwill	950,000	
(4) Issued on Revaluation of Sheffield Works	90,442	
		2,395,000
		20,679,290
<i>Less :</i>		
Written off Ordinary Share Capital under Capital Reduction Scheme		8,210,322
Present Issued Share Capital		£12,468,968

Full details of the above are shown in the following statement :—

APPENDIX 16—continued.

(See Q. 2189.)

TOTAL STRENGTH OF PERMANENT AGENTS ABROAD.

The total strength of the armament agents of Vickers-Armstrongs Limited, Vickers (Aviation) Limited, The Supermarine Aviation Works (Vickers) Limited and The Whitehead Torpedo Co., Limited at 1st January 1936 was	40
Details are given hereunder:—	
Agents of Vickers-Armstrongs Limited	35
Agents of Vickers (Aviation) Limited and The Supermarine Aviation Works (Vickers) Limited	5
	40

Note.—Of the agents of Vickers-Armstrongs Limited:—

29 act also for Vickers (Aviation) Limited and The Supermarine Aviation Works (Vickers) Limited.

14 act also for The Whitehead Torpedo Co., Limited.

APPENDIX 18.

(See Q. 2239.)

STATEMENT SHOWING NUMBERS OF SKILLED, SEMI-SKILLED AND UNSKILLED PERSONS EMPLOYED IN CERTAIN WORKS.

Vickers House,
Broadway, Westminster,
London, S.W.1.
13th January, 1936.

or 50 Draughtsmen and Designers employed in slack times. The numbers shown on the enclosed statement will let you see what this problem means to a firm of our size.

I enclose a further statement showing what we are doing to try to meet the shortage of skilled men. Of course, it would have been quite impossible for us to have so many apprentices under training, without the high-class commercial work which we have undertaken during the years when Warship and Armament orders were scarce.

The apprentice draughtsmen are selected from the best boys who have done three years of training in the shops, at the end of which period an examination is held and the successful candidates pass into the Drawing Office for the final two years of their apprenticeship.

I remember that when Sir Eustace D'Eyncourt was giving evidence, Sir Kenneth Lee particularly asked for information about the necessity of skilled men to-day compared with many years ago. I think the members of the Commission can rest assured that we should not employ skilled men, especially to-day when there is a serious shortage of them, unless we were obliged to do so and therefore the return I have sent you will provide a reliable answer to Sir Kenneth Lee's question.

I have the honour to be, Sir,

Your obedient Servant,

C. W. CRAVEN.

The Secretary,
The Royal Commission on the Private
Manufacture of and Trading in Arms,
8, Buckingham Gate,
S.W.1.

Sir,

I enclose herewith a list showing the various types of labour employed by the Company. You will notice that it is for the week ending 7th December, 1935, and therefore the total figure does not agree with the figure I gave to the Royal Commission in my evidence.

I should like to explain that the skilled men are or can be members of the Craft Unions. The semi-skilled men are principally those working machines and in certain districts it is possible for a man who has worked a heavy machine as a semi-skilled man to be graded up and later brought into the list of skilled men. By staff we mean everyone who is on an "upstanding" wage, that is, not a day to day engagement.

I also enclose particulars of our Drawing Office Staff. I think Admiral Bacon in his evidence, referred to the difficulty he found in keeping his 40

NUMBER OF EMPLOYEES.

APPENDIX 19.

[See Q. 2300.]

The documents submitted by Sir Charles Craven, in so far as they were not read in the course of the Hearing, were as follow:—

1. MESSRS. VICKERS SONS & MAXIM TO ADMIRALTY.
Strictly confidential.

The Secretary of the Admiralty,
Admiralty, Whitehall, S.W.

27th October, 1900.

Sir,

[See Q. 2304.]

(a) *Speed on the surface and radius of action with oil motor.*

8 knots in fine weather; 7 knots in ordinary weather. The radius of action with oil motor depends on the amount of gasoline carried, and the quality of the gasoline, but in the ordinary way the boat should be capable of covering about 250 knots at full speed. At a lower speed the radius of action will be greatly increased, depending on the wind, weather and other general circumstances. We will submit to a penalty of £1,000 per every knot below 7 knots not attained when submerged.

(b) *Speed when submerged and radius of action with accumulators.*

7 knots. Radius of action 25 knots. We will guarantee full speed for 25 knots.

(c) *Distance that the vessel can go submerged and time for which she can remain closed up without inconvenience to the crew.*

Distance submerged 15 knots. Time closed up 3 hours.

(d) *Limits within which course and depth can be maintained.*

Official trials in America have shown that she will steer absolutely correct if properly directed, but naturally the steering depends on currents and personal considerations. She will, in the ordinary way, steer quite as well submerged as any boat on the surface.

Limit of depth, average 2 feet, maximum 4 feet.

(e) *Time required to pass from working on the surface with oil motor to the submerged condition.*

This will take from 2 to 10 minutes according to the skill of the crew.

(f) *Depth to which the vessel can be safely submerged.*

100 feet. In regard to these guaranteed conditions, as above, we beg to say that the official guarantees by the Holland Torpedo Boat Company in America were considerably exceeded at the official trials, and we have every reason to believe that better results than those we have mentioned will be obtained.

In regard to paragraph 7 of your letter, we note the conditions enumerated therein, and we fully understand that our rights of design, patents, etc., will be respected during the terms the patents or any improvements thereon are in force.

We enclose herewith a list of patents in force or pending owned by the Holland Torpedo Boat Company which may be of interest in showing the large amount of experimental work which the American Company have had to carry out during the development of this boat.

We have the honour to be, Sir,

Your obedient Servants,

VICKERS SONS & MAXIM LIMITED.

[ENCLOSURE.]

27th October, 1900.

Strictly confidential.

Holland Torpedo Boat Company.

List of Patents in Force or Pending.

1. Letters Patent No. 522,177.

General design of submarine torpedo boat.
In force only in the United States.

2. Letters Patent No. 492,960.

Steering apparatus for submarine vessels.
In force only in the United States.

3. Letters Patent No. 472,670. U.S.

Submergible torpedo boat. "Submerger."
A surface torpedo boat that submerges its hull in action, depending for buoyancy on its exposed armoured turret. In force in the U.S. Great Britain No. 7941/92 and Belgium No. 99,307 of 1892.

4. Letters Patent No. 537,113. U.S.

Automatic compensation for weights exposed. (Submergible boat.)

In force in the United States, Great Britain No. 7247/1895, Germany 85600, Germany Division 86352, Sweden 7051 of 1895, Sweden Division 7053 of 1895, Belgium 115,012 of 1895, Italy Vol. 30/75 No. 38631/430 of 1895.

Applications Pending.

5. Arrangement for water ballast tanks to ensure most suitable trim for surface and for submerged running.

New application in all maritime countries.

6. Means of securing immovable centre of gravity, being a combination of a boat of unvarying total weight when light with ballast tanks of definite volume filled completely with water.

New application in all maritime countries.

7. Arrangement of water ballast tanks and apparatus to enable submarine boats to manoeuvre rapidly in water of various specific gravity.

New application in all maritime countries.

8. Automatic control of specific weight of submarine boat to cause it to correspond with the specific weight of the water in which it operates.

New application in all maritime countries.

9. Automatic prevention of dive below pre-determined depth.
New application in all maritime countries.
10. Automatic lightening of boat's total weight in case of accidental submergence below pre-determined depth limit.
New application in all maritime countries.
11. Visual gauge, indicating trim, longitudinal inclination and depth of submergence.
New application pending in all maritime countries.
12. Means of preserving total weight and trim unchanged when torpedoes are discharged or moved in the boat's interior.
New application in all maritime countries.
13. Arrangements of the boat's interior and of the main elements of weight to ensure liveliness and handiness.
New application in all maritime countries.

2. ADMIRALTY TO MESSRS. VICKERS SONS AND MAXIM, LTD.

Strictly Confidential.

Admiralty, S.W.
13th December, 1900.

S. 26846/25177.
Gentlemen,

Referring to your letter of the 12th ultimo and to the previous correspondence and interviews which have taken place, on the subject of the supply to the Lords Commissioners of the Admiralty Submarine Boats of the Holland Type No. 7, My Lords desire me to inform you that they are now prepared to agree with you for the construction and delivery of five such boats on the following conditions:—

2. The price including royalty of each of these boats is to be £35,000 (Thirty-five thousand pounds) to include the delivery of the boat at such English Naval ports as may be selected by the Admiralty.

3. The boats are to be in every respect similar to the best submarine boats which are now under manufacture for the United States Navy by the Holland Torpedo Boat Company; and all improvements which experience in America may render possible before the delivery of the boats are to be embodied in them without additional payment of Royalty or otherwise. During the construction of the boats the representatives of their Lordships are to have access to your works to inspect the manufacture and to test the quality of materials used.

4. The conditions to be guaranteed and fulfilled at the official acceptance trials of the boats are to be those enumerated in paragraph 8 of your letter to the Admiralty of the 27th of October, 1900. It is to be understood however that the limits within which the course and depth are to be maintained on these trials must not exceed the limits shown in corresponding trials for the United States Navy. These limits are to be stated definitely and embodied in the formal contract which will be prepared if this offer is accepted by you.

5. A trained crew is to be provided by you and placed at the service of the Admiralty for the purpose of instructing a British Naval Crew in the

working of the Boats under all circumstances of service. The Admiralty agrees to pay the expenses of the maintenance and services of the trained crew, at rates to be mutually agreed upon.

6. Dates are to be agreed upon for the completion and delivery of the boats. It is desired that the first boat shall be completed and delivered at the earliest possible date.

7. If any additional boats are ordered of you the price per boat shall be determined by separate negotiation but shall not exceed £35,000 (Thirty-five thousand pounds) including Royalty unless substantial improvements are introduced. A Royalty of £2,500 (Two thousand five hundred pounds) per boat shall be paid you in respect of any boats built in H.M. Dockyards in cases where the Holland Patents are used and so long as they remain in force.

8. As regards your proposal that their Lordships should undertake to pay a Royalty of £10,000 (Ten thousand pounds) per boat, on any boat ordered for manufacture by private firms in this country I am to inform you that there is no intention to place such orders; but should exceptional circumstances make such action desirable the question of Royalty will be dealt with at the time.

9. My Lords agree that you shall receive about one half of any orders for boats of this type which they may require.

10. Their Lordships will undertake that the details of boats supplied to them by you or built in H.M. Dockyards shall be kept confidential as far as possible consistently with the effective use of the boats. They will however require from you a like undertaking that you will keep confidential any improvements in the construction of the boats which may be suggested by the Admiralty.

11. My Lords must be satisfied by you that you are legally entitled to contract with their Lordships for the construction and delivery of the five boats in question and of any further boats that may be ordered of you, and will require an indemnity from you against any claim for Royalty on the part of the Holland Boat Company.

12. I am to request that you will state whether you are prepared to accept the order for the five boats on the terms above specified and if so that you will submit the dates at which you will undertake to deliver the first and each of the four succeeding boats at one of H.M. Dockyards, the limits within which the course and depth are to be maintained on the trials of the boats (see paragraph 4) and furnish evidence that you are in a position to contract for the construction and delivery of the boats in question.

I am,
Gentlemen,

Your obedient Servant,

EVAN MACGREGOR.

Messrs. Vickers Sons & Maxim, Ltd.

APPENDIX 20.

(See Q. 2516.)

The following Questions were put by Dame Rachel Crowdy in writing:—

I.—(A) How many employees in your factories were engaged in manufacture of arms:—

(i) On 1st January, 1932;

(ii) On 1st November, 1935.

(B) What proportion of these men were engaged in manufacturing arms for export to non-British countries abroad?

II. What proportion of these men are highly specialised workers who could not easily be transferred to employment in the production of "peaceful" products?

III. What is the proportion of "peaceful" and "warlike" products respectively?

Could you give these proportions in a list of the various peaceful and warlike products for each of the factories under your control?

The replies submitted by Messrs. Vickers Ltd., are as follows:—

I.—NUMBERS OF EMPLOYEES ON 1ST JANUARY, 1932 AND 1ST NOVEMBER, 1935, RESPECTIVELY ENGAGED ON

II.—THE PROPORTION OF MEN (ENGAGED IN THE MANUFACTURE OF ARMS) WHO ARE HIGHLY SPECIALISED WORKERS WHO COULD NOT EASILY BE TRANSFERRED TO EMPLOYMENT IN THE PRODUCTION OF PEACEFUL PRODUCTS.

In regard to the question as to how many of the men employed on armament manufacture at certain specified dates could not be transferred to employment on commercial products, the answer, generally speaking, is that in the case of Vickers-Armstrongs Limited, which is the main armament producing company, all men engaged on armament work, with the exception of possibly 50 design specialists, could be transferred to such work provided

always that there were sufficient commercial work of a high class engineering nature available to employ their services. Generally speaking, this answer applies to all the companies engaged on armament production in the Group with the exception possibly of The Whitehead Torpedo Co. Limited. The work of that company is of a specialised nature and there being no commercial products produced there at the moment, it might be difficult to find suitable commercial work of the nature on which the men could be employed, but here again, assuming that suitable commercial work were available the men employed on armament manufacture could be transferred to commercial products.

III.—PROPORTION OF PEACEFUL AND WARLIKE PRODUCTS RESPECTIVELY EXPRESSED IN NUMBER OF EMPLOYEES AND LIST OF SUCH PRODUCTS IN RESPECT OF EACH WORKS.

APPENDIX 21.

MEMORANDUM SUBMITTED BY SIR CHARLES CRAVEN RELATING TO ARRANGEMENTS BETWEEN BRITISH FIRMS ENGAGED IN WARSHIP BUILDING.

Shipbuilding Conference.

It is common knowledge that since the War the shipbuilding industry of this country has been in a very depressed condition, in which state it still remains, the recent improvement being so small as to have little effect on the industry as a whole. For some years after the War the shipbuilders struggled independently against the prevailing conditions in the hope that there would be a return to a more normal state of affairs. During this period competition for the few orders available was so intense and prices were so keenly cut that it is safe to say that no ship of any size was built at a price that covered establishment charges, or, in other words, without a loss to the builder. This applied to warships as well as merchant ships. The hope that conditions would improve was not realised, and in fact they progressively deteriorated. In consequence, the firms in the shipbuilding industry then decided that they must take some steps amongst themselves to endeavour to prevent the wasteful and uneconomic methods that were being followed, if the bulk of the members were not to find themselves bankrupt in the course of a few years.

Their first step was to form the Shipbuilding Conference, and subsequently National Shipbuilders Security Limited. The latter organisation has as its object the purchase of redundant shipbuilding yards, and berths in shipyards, and their sterilisation as far as building of ships is concerned, thus endeavouring to bring the capacity for output more nearly into line with the requirements for new construction, and to some extent this has improved the position.

The Shipbuilding Conference embraced all the principal merchant shipbuilders in the country, including of course all the builders of warships. The volume of orders for warships, both British and foreign, is so much reduced in recent years that practically all the builders of warships are primarily dependent upon merchant work to keep their shipyards occupied. The Shipbuilding Conference, however, deals only with merchant vessels, warships being excluded from the scope of its activities since only a few of the members are interested in warship construction, and the details of its operations will therefore be of no special interest to the Royal Commission. It may, however, be stated that the ultimate object of the conference is the complete reorganisation of the whole of the shipbuilding industry. Progress is being steadily made towards that end, but it is necessarily slow in view of the large number of shipbuilders concerned, scattered over Great Britain and Northern Ireland, the multiplicity of their interests and the variety of their products.

Warships.

Though the reorganisation of the shipbuilding industry so far as warship building is concerned was undertaken independently of the conference by those members of the conference interested therein, it is a part of the general scheme for the whole industry. The warship builders are all important companies, and took a leading part in the formation of the Shipbuilding Conference and N.S.S., Ltd. Their numbers are, however, limited, there being not more than twenty firms seriously interested in building warships and their machinery, and it was therefore less difficult for them to get together and formulate

arrangements than for the vast number of firms engaged in merchant ship construction, and also the problems were less complex owing to the smaller number of different types of ships involved.

Consequently, the progress of the general scheme has been more rapid and complete in respect to warships than to merchant ships.

Cruiser building after the War commenced in the year 1924, at a time when the shipbuilding industry was at a very low ebb. Some of the firms were entirely without work and others were accepting orders at prices which were barely sufficient to cover material and labour costs.

Accordingly, in 1925, certain conversations took place between the warship builders, the outcome of which was a distribution of the available work at prices which gave a reasonable return, and enabled technical staffs and plant to be retained.

Even with these arrangements some of the firms found it impossible to continue in business, as evidenced by the fact that Palmers and Beardmores have closed down and Armstrongs have been amalgamated with Vickers as regards their warship, passenger ships, armament and steel business.

The agreements in regard to shipbuilding referred to in our reply to the Questionnaire were drawn up in order to put on a more formal basis, arrangements, some of which had already been in existence for nine years, and which had been found to be of practical value.

It is my opinion that the agreements between the firms to distribute the work in this way have been of great advantage both to the government and the industry. Without such arrangements it is obvious that, in view of the comparatively small volume of work available, the weaker of the firms would have disappeared from business, and the stronger firms would have had their resources considerably depleted by the effect of accepting work at unremunerative prices. Further, without this, it seems clear that some arrangement for an equitable division of the available work over the districts would have had to be made by the Admiralty, who could not have allowed firms with strong cash resources to have taken more than a certain proportion of orders, owing to the necessity of keeping the skill and equipment available in a sufficient number of firms on the warship contractors' list in the event of a national emergency arising.

It is interesting to note that, although arrangements for obtaining reasonable prices have now been in force for several years, the cost per ton of all ships built in the Royal Dockyards in the years 1925 to 1934 inclusive, as recently stated to Parliament by the First Lord of the Admiralty, was £220-55, whereas in the same period the price paid per ton to the private firms was £201-15. The above figures include two battleships in the ships built by contract, and as no battleships were built in the Royal Dockyards in this period, perhaps a more accurate comparison would be obtained by excluding battleships, in which case the price per ton of the contract-built ships works out at £210-4.

With this agreement between the firms there is now a much better field for the interchange of technical information, and the practical difficulties that arise during construction are more readily discussed than could be the case under more competitive conditions.

APPENDIX 22.

LETTER WITH ENCLOSURES FROM SIR C. CRAVEN RELATING TO AN ACCUSATION OF BRIBERY.

Vickers House,
Broadway, Westminster,
London, S.W.1.
13th January, 1936.

The Secretary,
The Royal Commission on the
Private Manufacture of and
Trading in Arms,
8, Buckingham Gate,
S.W.1.

Sir,

I have the honour to refer to one particularly unpleasant charge which was brought against me at the American investigation, when I was accused of the bribery of a British Government official, arising out of a letter which I wrote to Mr. Spear of the Electric Boat Company, dated 10th September, 1930.

You will see, on referring to Exhibit 20 and pages 29 and 30 of Volume one of the American investigation the charges to which I refer.

I had hoped that the matter would have been raised at my recent examination, but as it was not brought up, I submit herewith a brief note of the evidence which I should have given regarding the matter and a photographic copy of a letter which I received from Engineer Vice-Admiral Sir Harold Brown, K.C.B., the Engineer-in-Chief of the Fleet, dated 2nd January, 1935.

I submit that this reply and copy of letter should be added to the records of the Royal Commission.

I have the honour to be,

Sir,

Your obedient servant,

C. W. CRAVEN.

AMERICAN ARMS INQUIRY.

Exhibit 20—Page 331.

My letter to Spear, dated 10th September, 1930.

This letter refers to H.M.S. "Thames." An endeavour was made at the United States inquiry to get Spear to admit that I had bribed someone because in my letter I stated that "there was certain action I had to take which involved expenditure." I could not explain this expenditure to Spear at the time because the Admiralty had introduced a new machinery arrangement in the "Thames" which they then wished to keep secret.

This involved the installation of two patented Ricardo type diesel engines for charging batteries and driving the blowers for the main engines. We had hoped that the Admiralty would supply us with these auxiliary engines for which we had no licence to manufacture or permit us to purchase from the only licensee. We had no knowledge of their behaviour, nor had we any experience of their manufacture. We could have purchased engines from Brotherhoods, the licensees of the Ricardo engine, for £8,689 11s., but the Engineer-in-Chief of the Fleet insisted on our manufacturing them ourselves, so ensuring undivided responsibility for the whole engine installation of the submarine, which totalled 10,000 B.H.P. We, therefore, had to take a licence from Ricardo involving us in a lump sum payment of £5,000, plus royalty of 6s. per B.H.P. This is the special expenditure to which I referred in my letter.

Personal.

Admiralty, S.W.1.

2nd January, 1935.

Cdr. Sir C. W. Craven, O.B.E., R.N.,
Messrs. Vickers-Armstrongs Limited,
Naval Construction Works, Barrow-
in-Furness.

My dear Craven,

I am sorry to have been so long answering your telephone inquiry of 27th re "Thames" Ricardo engines, but I'm afraid I forgot it for the moment.

I have made inquiries which confirm my own recollection that you were told we wished you to make these engines yourselves and thus assume full responsibility for the job as a whole.

I have no direct evidence as to whether your original tender contemplated making these engines yourselves or purchasing them from Messrs. Brotherhood, but in view of the above conversation and the fact that your quotation for this machinery was identical with that of Messrs. Brotherhood I can only assume you proposed obtaining them from Messrs. Brotherhood.

Hope this is the information you want.

Yours sincerely,

H. A. BROWN.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

FIFTEENTH DAY

Wednesday, 5th February, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Chairman: We propose to-day to commence taking the evidence of Imperial Chemical Industries, Limited, but before we do that I have two statements which I want to make, and the first is this.

I have since our last meeting received several letters addressed to me personally complaining of sittings of the Commission being held in private and urging the importance of the publication of all material submitted to us.

As one of these letters was published in the Press I think that the best way of dealing with them is to make a statement here to-day.

With regard to the general question of publicity it must, I think, be obvious that some of the information which it is important should be given to the Commission can only in the public interest be given confidentially—I refer for illustration to matters relating to questions of national defence and Government preparations for dealing with an emergency.

There is also information of a different character which may be brought before the Commission, which the Commission may consider they should not insist upon being made public, because it is of such a character that publication might be injurious to the general business interests of the witness, or the information in question is either quite irrelevant to the issues before the Commission, or is of such slight importance that it would clearly be unreasonable to refuse a request that it should not be published. On these last mentioned questions the Commission must be the judge.

At our first sitting I announced that our sittings to take evidence would as far as possible be held in public, and to this I adhere; and I desire also to state that in coming to a decision as to whether a sitting should be held in public or not, or whether any information given to the Commission should be withheld from publication, the Commission recognise that account should be taken of the legitimate desire of the public for information, as well as of the protection of public and private interests.

If reference is made to Vickers Ltd.'s evidence* it will be seen that their claim and their request for non-publication falls under one or other of the two heads. As regards Question 6, this relates to matter of national defence, which it would not be in the public interest to disclose. The remainder of the unpublished matter is covered by the other exception which I have mentioned, except in so far as it has already been made public in the proceedings of the United States Senatorial Committee.

Much of the information under this second head has really no relation at all to any matter which has been brought before us, or any matter which we need consider; as for instance that part of the

information in reply to Question 7 which relates to agreements solely concerning the firms' ordinary business and having no relation to their armaments business; and with regard to the remainder, the Commission came to their decision after careful consideration.

I have made this somewhat lengthy statement not because I consider that the writers of the letters are entitled to the information I have given, but because I wish that the grounds upon which the Commission have acted, and will continue to act, should be generally known.

With regard to private sittings three only have so far been held. In one instance, in which the Court was cleared, this was done because a member of the Commission wished to ask questions the answers to which might have disclosed matters the disclosure of which was undesirable from the point of view of national defence. The sitting only lasted a few minutes and no answer was given which can be regarded as at all material.

A second instance was when we heard Sir Eric Geddes who, in response to my request that he should give us the benefit of his experience, consented to do so provided he was heard in private: A note was taken of his evidence and that of Colonel Mayo and it is in print and will with Sir Eric's consent be published in full in due course and form part of our proceedings.

The third instance was when Sir Maurice Hankey, who is proposing to give evidence at one of our next meetings in public, gave us information of an important but extremely confidential character.

I had written the above before receiving on Monday morning a further letter signed by a number of persons who had either given evidence before us, or who were interested in the proceedings of this Commission.

It is a mistake to assume, as the letter apparently does, that the Commission acquiesce in a request for non-publication of material supplied to them without investigation or consideration; or that the Commission necessarily bases its decision merely on the grounds indicated in the request; or that the documents upon which the Commission have come to a decision contain "relevant information concerning major issues," as the letter contends. It is only those who have had the opportunity of considering the material withheld from publication who can decide the question of relevancy, which as pointed out above must be entirely a matter for the Commission to decide.

With regard to the second point mentioned in the letter, the Commission will of course be prepared to consider any further suggestions submitted to them; but I would point out that the illustrations submitted are really suggestions as to the inferences which the Commission ought in the opinion of the

* See *Minutes of Evidence*, 13th & 14th Days, p. 346.

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

signatories to draw from the evidence already before them rather than suggestions why further evidence is required.

So much for that. The other statement is a statement which I desire to make in reference to a complaint by the directors of the P. & O. Company, who felt aggrieved because of a statement that had been made in the evidence by the Union of Democratic Control. In their statement before us they had referred to a firm of Alexander Stephen & Sons, who are building ships for the government, and they had referred to the fact that the P. & O. Company had held a number of shares in this company and they went on to infer from the facts with reference to the holding of those shares that the method by which the P. & O. Company had exercised its control "is typical of the way in which the control of armament and other firms is switched about among nominees." The P. & O. complain of that and they say in a letter addressed to our secretary: "I am instructed to inform you that the statement is inaccurate in material particulars, and that the inference of subterfuge drawn in the second paragraph is entirely misleading."

I ought to add that the P. & O. go on to say that of the two blocks of shares referred to in the statement of the Union of Democratic Control, one

was a block of ordinary shares and one was a block of preference shares, and the P. & O. point out that, with regard to the preference shares, they have always been held and registered in the name of the P. & O. and, with regard to the ordinary shares, the block was sold for cash in 1925 outright. We thought it right to submit their letter to the Union of Democratic Control. In answer to that letter, the secretary to the Union of Democratic Control contends that they were justified in their statement; because although the P. & O. sold the shares in 1925, those shares are to-day controlled by a company whose directors are also directors of the P. & O. Company.

Now I have stated in public what each party wished to say about this matter. It is entirely outside the scope of anything that we either wish to decide or have the power to decide and the matter must be left there. Whether, in fact, the directors of those two companies who are at present holders of this block of ordinary shares are the same directors as the directors of the P. & O., and whether that justifies the statement which the P. & O. characterise as an inference of subterfuge, is a matter which it is impossible for us to decide and the readers of these statements must judge for themselves. Now, we will proceed with the evidence.

SIR HARRY DUNCAN MCGOWAN, K.B.E., Hon. D.C.L., Hon. LL.D.; Mr. HAROLD JOHN MITCHELL; Mr. JOHN ROGERS, O.B.E., F.I.C.; Colonel EDMUND FRASER CRESSWELL, D.S.O., Royal Artillery, retired; Mr. JAMES LAING; Mr. LEONARD WILLIAM BUCKFORD SMITH; Mr. CHARLES STANLEY ROBINSON, M.A., F.I.C., M.I.Chem.E.; representing Messrs. IMPERIAL CHEMICAL INDUSTRIES LTD.,

called and examined.

2578. *Chairman*: We have been supplied with a statement in full by Imperial Chemical Industries, Limited, and a statement containing the answers to the questions which we have submitted to them for their answer; also a statement by the chairman which he wishes to give independently of the general statement by the company. It is proposed, subject to everybody's convenience, that the general statement should be read in the first instance and that it

should be followed by the chairman's statement, and then we will go through the statement containing the answers, and any questions which the members of the Commission desire to put to any of the witnesses will follow. Does that meet with your approval?

Sir Harry McGowan: Yes, Sir.

The following statement was read:

STATEMENT SUBMITTED BY MESSRS. IMPERIAL CHEMICAL INDUSTRIES LTD.

1. There is a widespread, but utterly fallacious, impression that Imperial Chemical Industries, Limited, is essentially an armaments firm, engaged to a large extent in the production of war materials.

2. I.C.I. is advantaged far more by the profits of peace-time operations than by the results of the sharp peaks of emergency production. The company enjoys real prosperity only in extended periods of tranquillity and industrious endeavour.

3. I.C.I. is the result of a combination of interests, the products of which cover a very wide field ranging from mining, quarrying and, to a minor extent, military explosives, non-ferrous metals and sporting and military ammunition to an enormous variety of chemical products including alkalis, acids, fertilisers, industrial gases, dyes, paints, lacquers, plastics, insecticides and such goods as leathercloth, lightning fasteners, motor bicycles, etc., etc. The manufacturing activities of the company are divided into eight groups, only two of which (the explosives and metals groups) are directly concerned with the manufacture of munitions. Even in these two groups sales of military products are only about 5-6 per cent. of their turnover. In relation to the total turnover of I.C.I., its total sales of military products in the last five years are only 1.8 per cent., whilst foreign sales are only 0.9 per cent. The proportion

of the company's total profits attributable to "arms and munitions of war" averages only 1.4 per cent. over the same period.

4. These military products consist mainly of propellant powders and T.N.T.—the latter also being incorporated in mining explosives—and small arms ammunition or component parts therefor, such as brass cups, discs and cartridge cases. To remove any misunderstanding it should be stated that, in addition to their present moderate capacity engaged in the manufacture of such products, I.C.I. with the full knowledge and desire of H.M. Government, are without subsidy maintaining for use, or in a condition capable of rapid installation for use in case of national emergency, certain plants for military explosives and small arms ammunition. These have not been employed since 1918 and do not, therefore, find a place in the company's active field of operations.

5. A definition of "armaments" has been made which directs the Commission exclusively to the concerns which are equipped for building battleships and manufacturing guns, tanks, ammunition, explosives, and the like, with a consequent creation of public prejudice against these particular concerns. But it must be apparent that there is hardly an industry in the country that is not interested in materials for military activities.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

6. Reference has been constantly made to a "traffic in arms" and in conjunction with this directors and shareholders in industrial enterprises have been freely pilloried. "Traffic in arms" has been compared to the "drug traffic" and the "slave traffic." There is no evidence that the Company, or any individuals connected with it, are actuated by any base or improper motive in supplying—in open competition with manufacturers of other countries, and always and only by British Government licence—the materials considered necessary by friendly nations for purposes of national defence. The company has submitted a list of its agreements, understandings and associations with other concerns engaged in similar activities to its own, and a study of those documents will show that for the most part the agreements deal solely with industrial commodities. The company holds that this evidence successfully disposes of the claim that it is, directly or indirectly, party to what has been designated an "International Armaments Ring."

7. Suggestions have been made that attempts to stimulate armament business in certain directions have been made either by newspaper propaganda, or by otherwise insinuating that others are purchasing armaments. It has also been suggested that attempts have been made to influence international conferences and to hinder the British Government's efforts for universal peace. Such insinuations, if made in relation to I.C.I., are refuted.

8. In the years 1914-1918, the facilities which existed in this country for the manufacture of munitions and the expert technical knowledge of them possessed by certain firms were freely drawn upon by H.M. Government and regarded as a vital asset in the successful defence of the country. The position is not very different to-day, when other nations are rapidly increasing their armed forces, that we can now afford to dissipate the collective potentialities of private industry.

9. It has been suggested that private industry to some extent failed the country in the War. There may have been some such instances, although it should not be forgotten that war-time requirements are so peculiar and colossal as compared with peace time that they cannot always be anticipated. I.C.I. claims that during the War its associated companies did all, if indeed not more, than could have been expected, and kept their promises, and they were at the time thanked accordingly.

10. Certain statements have been made publicly to the effect that the costs of private enterprise materially exceeded those of Government factories during the war period. True comparisons are well-nigh impossible owing to varying conditions and the wide differences in methods of costing. It was impossible to avoid this under the extreme pressure of the time, but it is relevant as regards costs comparisons to refer to the principal Government factory. In this connection attention is directed to the Report by the Committee of Enquiry into the Royal Ordnance Factory, Woolwich,* submitted to the then Minister of Munitions (Lord Inverforth) which appears to be particularly appropriate to the point. Dealing with costs the report states:—

"During the War no complete accounts or statements of costs have been rendered by Woolwich as stock has not been taken since the beginning of the War, so that even the yearly figures of costs of production are not now available."

And, further, that:—

"The control, supervision and management of Woolwich have in the main been conducted during the War without any adequate systematised knowledge of what the various products were costing."

11. On the point of utility to the State, I.C.I. while not to any material extent engaged during times of peace in the manufacture of military products, as shown in paragraph 3, has great potential

resources for their manufacture, as although many of its plants were designed for commercial products, they can be readily converted to other uses. For example, we produce considerable quantities of nitric acid which is a basic material for practically all high explosives manufacture. From the by-products of the hydrogenation of coal, for the production of petrol, we can produce certain compounds which enter into particular types of high explosives. We manufacture nitro-cellulose for industrial purposes, and could readily change over to nitro-cellulose for military explosives. Some of our sporting powder plant could be utilised for military propellants. Our nitrogen plant for the production of fertilisers, is capable of being converted to produce ingredients necessary in certain disruptive explosives. Our nitro-glycerine plant, used in connection with the manufacture of mining and quarrying explosives, can be turned over to the production of a necessary ingredient for the manufacture of cordite, subject, of course, to the continuance of the necessary production of explosives for coal mining. Detonators, safety fuse, gunpowder, and other materials, which we manufacture for the mining and quarrying industries, appropriately modified, can be used for military purposes.

12. Under modern conditions of war it would be impossible for any first-class nation to defend itself without an extensive, highly skilled and perfectly equipped chemical industry, such as that available in I.C.I.

As evidence of the great contribution towards national security made by I.C.I. in pursuit of its normal peace-time activities the following illustrative details are submitted. These indicate that the chemical industry of the country has been placed on a sound basis and that it has been enabled to achieve its proper place internationally, whilst at the same time the essential reserve of trained workers and technicians has been built up. An efficiently organised chemical industry is necessary to any highly industrialised country, particularly to one with great textile industries exporting a large proportion of their production. Without such products as caustic soda, soda ash, chlorine, sodium sulphide, dyestuffs, sulphuric and other acids these industries could not exist.

(a) Nitrogen and Petrol Synthesis.

During the War Germany was very largely thrown back on her internal resources, and she would have been unable to continue the War unless she had been able to obtain the supplies of nitric acid, essential for the continued manufacture of military explosives, as a result of her chemical industry developing the large scale fixation of atmospheric nitrogen. British nitric acid requirements were dependent on the importation of nitrate of soda from Chile, and sulphur from America and Spain, and were only secured by the strength of our Navy. It may be mentioned that approximately 1½ tons of nitrate of soda and ½ ton of sulphur are required for every ton of cordite or T.N.T. made.

The Government, recognising the extreme danger of this position decided in 1918 to erect a nitrogen fixation plant at Billingham although the technical knowledge available was scanty and inadequate. However, the War ended before much could be achieved and when Brunner, Mond & Co. took over this venture they had to start *de novo*. Since then that firm, and subsequently I.C.I., have developed the technique to a high state of efficiency and have created at Billingham an industry which employs directly nearly 10,000 men.

The obvious peace-time utilisation of fixed nitrogen is largely in the direction of nitrogenous fertilisers, and after the War Germany, and at a later date I.C.I., were able not only to meet all home requirements but to obtain world markets. The growth of economic nationalisation, however, soon diminished these markets and it became necessary to find other means of employing surplus plant.

* Cmd. 229.

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

The technique of the hydrogenation of coal to produce petrol has much in common with the high pressure synthesis of nitrogen compounds, and as a result of many years intensive research I.C.I. is employing a good deal of its surplus nitrogen plant and machinery, together with much new and special equipment, on the hydrogenation of British coal and cresosote to produce petrol.

Among the products manufactured at Billingham—all for industrial or agricultural purposes—are ammonia, nitric and sulphuric acids, ammonium nitrate, sulphate of ammonia, nitrate of soda and petrol. All of these would play a vital part during a time of national emergency and in their production I.C.I. is entirely self-contained and completely independent of any imported material.

The technical organisation at Billingham has, notwithstanding the many difficulties which had to be overcome, been built up to a high state of efficiency. It contains some of the best technicians not only in this country but in the world.

(b) *Dyestuffs Manufacture.*

It is axiomatic that a sound dyestuffs industry is essential to national security and well-being. The recognition of this by the British Government was evidenced by their active participation in British Dyestuffs Corporation and by their willingness to prohibit the importation of such dyestuffs as could be produced in Great Britain even when a free-trade policy prevailed.

At the end of the War, and for some time afterwards, the dyestuffs industry in this country was in a struggling condition, and although protected, as far as the home market was concerned, by Government regulation of imports, it was quite unable to hold its own in foreign markets. The position is now entirely changed, chiefly owing to the efforts of I.C.I. The expenditure of large sums on plant, processes, and research, combined with wide experience of international trading has placed Great Britain on a competitive footing with other foreign producers in the dyestuffs markets of the world. In addition, direct security of employment has been created for about 3,000 British workmen and some hundreds of organic chemists. Indirectly numerous other workers have benefited, as practically all the raw materials used in the dyestuffs industry are of home manufacture.

There is an ill-informed impression current that the dyestuffs industry is interested in the production of poison gases. This is entirely untrue. I.C.I.'s plants and processes are exclusively designed and employed for industrial purposes. It is, however, a national asset that the knowledge of organic chemistry; the trained personnel and the varied and flexible plant employed in this industry could be used in an emergency to make almost any organic compound.

It is not to the interests of dyestuffs makers to devote time and attention to materials to be used for lethal purposes. Phenol, for instance, which is obtained as a by-product from gas works, or can be synthesised in a suitably equipped dyestuffs plant, is used in large quantities in the production of synthetic resins of wide application in industry. It can also be converted into phenacetin, a pharmaceutical product of widely recognised beneficial properties. When treated with nitric acid it is converted into picric acid, which can be used as a dye intermediate, being the starting material for certain chrome dyestuffs. It can also be used for dressing wounds and burns and, of course, as a munition of war. It is obvious that the interest of the organic chemist and his chief employer, the dyestuffs manufacturer, will be focussed on the pharmaceutical and industrial aspects of phenol and its derivatives. It is a purely accidental circumstance, of little interest to them, that its derivative, picric acid, can be used as an explosive in time of war.

What has been said of phenol applies also to many other organic substances handled by the dyestuffs maker. In Germany the organic chemists, who built up such a wonderfully successful dyestuffs industry, soon turned their experience in research technique towards the invention and perfection of new organic pharmaceutical products. In the result a large and flourishing industry was created and incalculable medical benefits were conferred upon the world. It is only logical to expect that the organic chemists in this country, having succeeded in dyestuffs manufacture, should apply their increased knowledge and experience of organic chemistry to the development of organic pharmaceutical substances. I.C.I. has already made some progress in this direction in its dyestuffs research laboratories and factories. Other British firms are doubtless doing so as well and the British Empire is now less dependent than formerly on German or other continental pharmaceuticals for the relief or control of tropical diseases.

With so much to be achieved in the field of organic chemistry in humanitarian and remunerative industrial directions, it is obvious that I.C.I. would not be prepared to waste time or money on poison gases and other lethal substances of almost negligible application save in time of emergency.

(c) *General Chemicals.*

(i) *Sulphuric Acid.*

In paragraphs 37 and 38 of Dr. Addison's Statement of Evidence,* he states that additional capacity of 400,000 tons of oleum per annum had to be created and quotes £750,000 as being the capital cost. Even under present peace-time conditions the cost would exceed £2,000,000.

He also states that the bulk of sulphuric acid used in peace-time is produced in the form of dilute acid, whereas for explosives manufacture concentrated acid (oleum) is required. The balance between these two forms has, however, radically changed since the War. During the year July, 1933-June, 1934, the members of the National Sulphuric Acid Association (representing 90 per cent. of the total sulphuric acid production of Great Britain) made 1,113,514 tons of acid, of which no less than 301,828 was oleum. During this year the oleum plants have produced at the rate of approximately 335,000 tons annually and this rate will, as the result of plant extensions at present proceeding, be increased to approximately 400,000 tons before next year.

Striking as is this increase in the capacity of British Chemical Industry for the production of oleum, from the point of view of national emergency, of equal moment is the change in the technique of the manufacture of nitric acid. During the War nitric acid could only be made by acting upon imported nitrate of soda with sulphuric acid, of which 1.5 tons was required for every ton of nitric acid. To-day the whole of I.C.I.'s requirements of nitric acid for their own use and for external sales are made from ammonia, synthesised at Billingham from coal, water and air. In this manufacture sulphuric acid is only employed for concentration purposes, and the total usage per ton of nitric acid is only 0.1 ton. As cordite, T.N.T. and other military explosives need approximately ton for ton of nitric acid in their manufacture, it will be seen that there is a reduction of 1.4 tons per ton of explosive in the sulphuric acid now needed. In consequence it seems reasonably certain that the difficulties as regards sulphuric acid supply described in Dr. Addison's evidence cannot recur in this country.

Reference must also be made to I.C.I.'s achievement in developing a process to produce oleum from British calcium sulphate. Over 40,000 tons of concentrated sulphuric acid were made by this process in I.C.I. plants in 1933, and to-day they are equipped to produce at the rate of nearly 90,000

* *Minutes of Evidence*, 4th and 6th Days, Appendix, p. 114

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

tons annually of this commodity, using calcium sulphate as the source of sulphur. In the year July, 1933-June, 1934, nearly 460,000 tons of sulphur or sulphur-containing ores were imported into Britain as raw material for sulphuric acid production. In time of emergency no doubt this figure would rise appreciably unless the new I.C.I. technique were applied to substituting home-produced calcium sulphate for these importations.

(ii) *Chlorine and its Derivatives.*

Chlorine, either as such or in the form of bleaching powder, sodium hypochlorite, hydrochloric acid, chloroform, carbon tetrachloride and many other organic chloro-compounds, has been for many years, and is increasingly so, one of the most important and useful servants of the community and of the industries that sustain it. It is a basic raw material not only for dyestuffs, but for such important industries as the cotton textile and the paper trades, for which it constitutes the only bleaching agent. I.C.I. and its predecessors—the United Alkali Company and Casner-Kellners—have developed the electrolytic production of chlorine to a high degree of efficiency, and, through research expenditure and technical skill, have devised processes for the conversion of chlorine into compounds which find a rapidly increasing outlet for the purposes of industry.

It is well known that chlorine was used in the early days of the War for gas attacks, but became obsolete. It is also true that, like many other substances, in combination with various other chemical elements, it forms a variety of compounds, some of which have lethal properties rendering them capable of being used as weapons of offence in war time. Evidence of this kind has been laid before the Royal Commission and the suggestion has been made that some sort of State control should be exercised over chlorine production. Mustard gas contains such elements as carbon, chlorine, hydrogen and sulphur, and on this line of reasoning it would appear that the manufacturer of one or more of these elements is potentially a producer of mustard gas and a menace to the State—unless controlled.

But it is also an important fact, which should not be overlooked, that chlorine, apart from the important role played for purely industrial and peaceful purposes, affords, in the form of bleaching powder, the only known efficient means of decontamination after a mustard-gas attack, and so is a defensive weapon of the highest value, not only to the military, but possibly also to the civilian population.

It is only necessary to add that I.C.I. does not produce mustard gas, nor any other lethal gas for offensive purposes, and there is a long-standing instruction within the company that it is not to do so save at the direct request of the British Government.

To sum up, it is claimed that as a result of I.C.I.'s investment of very large sums of money in the manufacture of the peace-time requirements of industry and agriculture, there has been made available, technique, experience, plant and personnel which enables this country to obtain in war-time vital requirements for which previously reliance had to be placed on foreign sources.

13. The proposal to nationalise all factories engaged in the production of munitions could only be carried out at tremendous cost and would be economically unsound. Supposing for argument sake the Government proposes to enter the chemical industry (although it would be obviously unreasonable to single out this industry for the establishment of a State monopoly whilst other industries also essential to the State in emergency are to be allowed to maintain their private status), the chief problem to be faced is the export trade which under normal conditions is entirely commercial in its scope. The Government would then be competing with private

firms established in other countries. This would inevitably lead to international complications unless we assume that every manufacturing nation is going to act similarly. It is evident that the nationalisation of the chemical industry, or even a part of it, would involve the Government in establishing a chain of factories, many of which to a great extent would almost certainly stand idle for many years; and, when needed, be found to be hopelessly inefficient, if not practically out of date.

14. Even if the huge capital cost of nationalising the chemical industry is ignored, the question of personnel cannot be overlooked. It should not be assumed that executive and technical men who have been successful in commercial life would necessarily be willing to throw in their lot with a State monopoly. Generations of experience have been expended in establishing private enterprise on a solid foundation, and the lack of the incentive of commercial rivalry would tend to prejudice the maintenance of the same high standards of efficiency.

15. Consideration must also be given to the time which it would take to build up a State monopoly, even if its purpose were limited to the manufacture of essentially military equipment and materials. Many years must elapse before such an organisation could possibly be created and equipped with the scientific, technical and industrial knowledge necessary to make it entirely independent of other sources of supply. It is open to doubt whether in many cases a State monopoly would be able to achieve that end at all.

16. If, however, these arguments should not weigh with the Commission and the State is to be involved in heavy capital expenditure on the building of State factories designed exclusively for use in the case of war, then the Government should at the same time ensure that everything possible is done, by placing orders with industry, to encourage the maintenance of manufacturing experience, the continuance of research and developments arising therefrom which would prove to be of vital importance if, and when, the industries of the country have to be mobilised to deal with the enormous demand for supplies in time of crisis. In such circumstances, I.C.I. would, as it has always done, willingly throw the whole weight of its resources into the scale.

17. In considering the question of nationalisation, while it is agreed that national defence is of paramount importance, the Company holds the view that State-owned factories alone would be quite unable to meet the demands of this country and the Empire in the event of a great war.

18. The only satisfactory means of ensuring a sufficient output of materials of all kinds, necessary in case of war for our armed and auxiliary forces and for the protection of our civil population who may be exposed to almost equal risks, is by nation-wide conscription of industry as practised by the Ministry of Munitions in the period 1915-1918. In such a situation, there can be no doubt about the inadequacy of a State monopoly as a guarantee of national security. Much greater benefit and security can be obtained from the establishment of a permanent supervisory body armed with full powers, not to take away from private manufacturers their facilities for manufacture and substitute as an experiment a series of State monopolies, but, with due financial safeguards, to co-ordinate private manufacture and provide such auxiliary help as may be necessary by the erection of purely military factories where the demand is likely to be in excess of the capacity of private concerns. We have such military factories to-day in our dockyards and naval bases, and at places such as Woolwich, Waltham Abbey and Holton Heath; and it is suggested that it is for the Government to decide, after making a complete survey, how far it is necessary or practicable to lay down national factories to augment the production of industrial concerns. Under such a scheme it would be the duty of the supervisory body to take

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

a census of production at periodic intervals, to work out plans for ensuring supplies of all necessary materials and equipment, to see that adequate "security" stocks of essential supplies were available, that transport arrangements and all the other services including recruitment of personnel, are properly catered for, and other activities which were, in fact, the responsibility of the Ministry of Munitions during the last war.

19. There should be no undue interference with private enterprise, but every possible means should be taken to encourage it to co-operate to the full with H.M. Government in order that this country may never be found unprepared. I.C.I. and its predecessors have always been in close contact with British Government staff on technical and manufacturing problems and have given freely and continue to give of the knowledge acquired through experiment and research.

20. With regard to the provision of arms to other nations, the present system of export licences ensures that H.M. Government is satisfied on military and policy grounds that the orders placed with British manufacturers are for reasonable quantities and may be safely executed. Perhaps, as suggested by the U.S.A. Government, there might be the added obligation to report all issues of export licences to an international body, the latter step having as its object to ensure a more rigid adherence to this system by all manufacturing nations than has obtained in the past. The purchasing governments would however, for obvious reasons, probably object to the publication of this information. No other system can provide better safeguards, and the only alternatives are for H.M. Government and other governments themselves to undertake the supply of arms to friendly nations, or abolish exports altogether. No proof has been adduced that it would minimise the possibilities of war or lead to a better understanding if the supply of arms by private concerns were abolished and governments became the vendors. I.C.I. is not aware that H.M. Government has granted loans for the purchase of munitions or subsidised exports of munitions in any way. It is pertinent to inquire, however, whether the same can be said of other countries, particularly of such countries where there is a state manufacture of munitions, the purchase of which is a condition precedent to the granting of a loan. Furthermore, if all exports were prohibited, this must necessarily lead to much wider-spread manufacture by all nations, in order that each may be able to produce its own requirements. This in turn would give greatly increased capacity for production of war materials, much of which for efficiency reasons would be kept going. The temptation to manufacture beyond defensive requirements might become irresistible.

24th September, 1935.

2579. *Chairman:* That is the end of the Imperial Chemical Industries' statement. Now, Sir Harry McGowan, will you make your statement?

Sir Harry McGowan: As chairman of Imperial Chemical Industries, Limited, I welcome the opportunity of appearing personally before this Royal Commission.

I am accompanied by two of my colleagues on the board, Mr. H. J. Mitchell and Mr. John Rogers, and, in addition, I have with me of our staff, Colonel E. F. Creswell, Mr. James Laing, Mr. C. S. Robinson and Mr. L. W. B. Smith.

They, of necessity, are more familiar with the details of the munitions side of our business and will be able to answer any questions which you, Sir, or your colleagues, may care to put to them. I shall, therefore, confine myself to the broad questions of policy and general principles.

If you will look at the printed outline of our evidence,* you will observe that in the opening

paragraphs we give facts which I trust will, once and for all, disprove the widespread fallacy that Imperial Chemical Industries, Limited, is essentially an armaments firm.

The exact contrary is the case; munitions represent 1.4 per cent. of the total profits of the company; or, putting it another way, of the amount we pay in dividends, only one-seventieth comes from munitions. Our interests, therefore, obviously lie in the largest measure in products which are outside your definition of armaments; and for the prosperity of the company we desire nothing more than a state of tranquillity, in order that we may continue to expand our peace time industries.

With regard to our munitions manufacture, small as it is, I want to emphasise as strongly as possible that this is conducted with the full knowledge of the government departments concerned. I will go further and say that these departments are not only given the fullest facilities for knowing exactly what we are doing, including quite often the free transfer of technical information, but developments in our business are sometimes made at their request, and if the slightest doubt arises in our minds whether any particular course should be followed, we do not hesitate to consult their wishes in the matter.

You, Sir, will understand that I am speaking with a due sense of the responsibilities of my position, and I must add that I am imposing upon myself considerable restraint. Direct charges against my company during this Inquiry have been few; indeed, in the case of one or two witnesses, the company has been complimented on its efficiency. Other witnesses have asked you to call one person and another, and suggestions have been made that you should inquire into this and that. Such suggestions contain an innuendo that there is something, always undefined, which if you will only search long enough you will find, to support the allegations which have been made. We are prepared to deal with all or any of these matters, however trivial or even ridiculous some of them may seem, just as the Commission may desire.

In the meantime, I may perhaps deal with one of the suggestions that have been made. You have been asked to call for the agreements contained in a list,* which it was alleged was a list of representative documents. There were cited 38 such documents. The facts are that of these 38, 18 are non-existent as agreements. Of these 18 four refer to investments in explosives companies but only one of these investments is in a company which makes military as well as industrial explosives, and that is in Czechoslovakia. I should also like the Commission to know that of the remaining 20 agreements, four only have any reference to munitions.

2580. *Chairman:* May I interrupt for one moment? You say "There were cited 38 such documents. The facts are that of these 38, 18 are non-existent as agreements." When you say that 18 are non-existent as agreements, does it mean that they are not signed agreements, but they are understandings?

Sir Harry McGowan: It means that they are not agreements dealing with munitions, either technically or commercially.

2581. *Chairman:* I am rather puzzled by this. First of all you say that 18 of them are non-existent and then you say "Of these 18, 4 refer to investments." It is not plain to me what that means.

Mr. Mitchell: Of the 38 documents cited in this memorandum, 18 are non-existent. The words "as agreements" should not be there.

2582. *Chairman:* And then you go on to say "Of these 18."

Mr. Mitchell: That is a mistake. Eighteen are non-existent. There are no agreements existing, but we have investments in four companies, reducing the non-existent figure to 14.

* See p. 439, supra.

* See Appendix 1, p.465.

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

2583. *Chairman*: You mean there are no agreements.

Mr. Mitchell: There are four investments but they are non-military investments.

Sir Harry McGowan: It is within your knowledge, Sir, that long before this evidence to which I am referring was tendered to you, you asked to be furnished with particulars of our relevant agreements, and this information was prepared and willingly furnished to you.

I also resent a little the suggestions that my company or any individuals connected with it are actuated by base motives in supplying such materials as friendly nations, often unequipped with their own factories, need. It is sufficient, I think, for me to remind the Commission that such supplies are only made with the full knowledge of the British government, and only under British government licences.

Similarly, I deny that my company has ever done anything to hinder the British or any other government's efforts for universal peace, or has suggested to any foreign government that they should buy more than they themselves think they need.

I now come to a point which is, I think, worthy of notice. It is to be expected that those whose political faith leads them to believe that the socialisation of all industry would be for the benefit of the nation should seek to discredit the part which private industry played in the last war. I do not for one moment question the sincerity of those who hold that view, nor do I complain of their supporting it by such evidence as has already been tendered to you. I venture to suggest, however, that you have already heard, and will hear more, evidence which will convince you that it is misleading to suggest that private industry failed the country in the War. That mistakes were made, that miscalculations as to quantities required and which could be available at a given time, took place, and that developments were unforeseen, or not fully anticipated, must be admitted by everybody. Such mistakes and miscalculations were common to the services, politicians, state-controlled factories and private enterprise. The demands made on private industry were peculiar and colossal, and I would remind the Commission that it was from private industry that the Ministry of Munitions was mainly recruited. I claim for the companies which are now associated in Imperial Chemical Industries, Limited, that they lived up to their promises, and that the thanks which were accorded them for their efforts were fairly earned.

In considering under your terms of reference this question of the suppression of private manufacture of arms, it seemed to me that the Commission would want to know something of the part which chemical industry is called upon to play under modern conditions of war when any first-class nation has to defend itself.

In the hope that it may assist you, therefore, I have had set out in paragraph 12 of our evidence,* a brief statement, to which I call your special attention, of how such a chemical industry as is available in Great Britain, can contribute towards national security when in pursuit of its normal peace time activities. The Commission will understand that I felt a little diffidence in stating these facts because they must inevitably throw a high-light on the work of my own company, but I do not see how you can obtain a complete picture of the position without such information, and my technical experts will be very pleased to give any further information you may require, or to answer any questions on the information already given.

I can put the matter shortly by saying that here you have an example where very large sums of money, from private individuals and not from the state, have been invested for the manufacture of peace time requirements of industry including agri-

culture. In the result, there is available in this country to-day, the technique, experience, plant and personnel which enables this country to obtain in war time the vital requirements for which previously we had to rely on foreign sources. With the utmost emphasis of which I am capable, I beg the Commission to pause before they recommend anything which would destroy this vital asset to the country's safety.

May I again emphasise the matter of personnel. The successful meeting of emergency conditions depends largely on the required man power being available. This involves the adequate dilution of skilled management and skilled labour. At our Ardeer factory in Scotland, for example, we have quite a number of staff and workers now engaged on non-military products who have passed through the military section and who, therefore, can readily and intelligently return to such work, the staff having in the interim been kept in touch with military developments. At Witton, Birmingham, we have many working on sporting ammunition who by their training would be invaluable on military small arms. I submit that dilution as per the examples now set forth, and these are only indicative, is not possible in relation to state military establishments.

If I am to be of any further assistance to the Commission I think you would probably ask me to address myself to the question of the cost involved and the consequences which must follow if the proposal to nationalise all factories engaged in the production of all materials of military importance was accepted.

I think what has been said in paragraph 12 of our statement† goes to show that although your Inquiry is limited to a defined range of products, there are many substances produced by the chemical industry of great importance in peace time, and a great deal of machinery used in their production, which, if the nation is involved in war, are of vital importance.

I want to assume, solely for the sake of argument, that the government of the day proposes to enter chemical industry.

My first point is that I think it would be quite unreasonable for the government to select this industry for a state monopoly while other industries, equally essential in times of emergency, are allowed to maintain their private status. Logically, the government must select all or none.

If we ignore this point, however, we then come to another difficulty which is even more fundamental, that is, the problem of export trade. Let us imagine for one moment that the government is in control of chemical industry. In other countries, where private enterprise still remained, the traders in those countries would be competing for the world markets. One of their competitors would be the British government, who in peace time would have to sell the products of British chemical industry in all parts of the world against the private traders in foreign countries.

I would not presume, merely as a business man, to visualise the international complications which must ensue, but of one thing I am certain and that is that these complications must inevitably embarrass any government when entering into those commercial treaties with foreign countries which have become part of the government's policy.

It was made perfectly clear at the Ottawa Conference that the constituent parts of the Empire desired to consider how trade could be increased within the Commonwealth. It was made equally clear that this did not preclude our making arrangements with foreign nations who desired to trade with us on a basis of equality. Since Ottawa, various agreements have been made with foreign countries. In most of these agreements official notice has been taken of subsidiary agreements made

* See p. 440, *supra*.† See p. 440, *supra*.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

between various industries in each of those countries and corresponding industries in Great Britain. If the British government itself had been a trading body making those subsidiary agreements, I say unhesitatingly it would have caused the government great embarrassment, and I doubt very much whether any of those treaties could have been completed in their present form.

I would like to test this proposal a little further. It involves one of two things. Either you take over the existing factories, in which case, presumably, compensation would be paid for the factories acquired; or you set up a chain of national factories, many of which would almost certainly stand idle for many years. In either case the government is involved in very considerable expenditure. That is not the worst feature. Such factories, whether acquired or built, unless they were operated in peace time in competition with foreign manufacturers, could hardly in time of crisis be expected to be efficient and up to date.

The Commission has had evidence, designed to show the practicability of the prohibition of the private manufacture of and trading in chemicals and explosives, and the institution of a state monopoly. In my view none of this evidence shows any real understanding of the problems of chemical and explosives manufacture, but appears to be based on printed formulae and published processes.

But supposing, again solely for the sake of argument, we ignore the huge capital cost of nationalising the chemical industry, and the many years of practical experience gained by those engaged in the industry, we are still faced with the problem of personnel.

It has been very truly said that business men during the last war threw themselves wholeheartedly into the service of the state. From that it is assumed that in peace time, if the state assumes control of chemical industry, or any part of it, executive and technical men who have been successful in commercial life would necessarily be willing to throw in their lot with a state monopoly. This I believe to be a complete fallacy. The industrialists of this country have had handed down to them generations of experience which has been expended in establishing private enterprise on a solid foundation. To them, the incentive of commercial rivalry has led to very high standards of efficiency. To remove that commercial rivalry in times of peace would leave them without the mainspring of their actions and would leave the country in time of war with less efficient manufacturing units.

I should be lacking in my duty if I failed to point out to the Commission the time factor involved in building up a state monopoly. To create and equip such an organisation, even if it were within the power of the state to do so, must involve a lengthy period.

I can imagine, however, that you may say that, so far, my criticisms have been merely destructive, but I believe it was necessary to point out the consequences which, in my opinion, would follow state control in order that you may have a complete picture before you. With that picture in mind, I desire to make one or two constructive suggestions.

In view of what I have already said, and the confidential figures we have furnished showing that undue profits exist only in the imagination, it will not surprise you if I add that I do not criticise those persons who are desirous, in their own words, of "taking the profit out of war", by which I suppose they mean making profiteering in war requirements impossible. If one looks at the list of munitions which the Commission is considering, one cannot help being struck by the variety in character. The production of the items cited involves many differences in the capital employed, research expenses, wages, materials and explosion risk. Therefore, it does not seem to me that it would be possible to evolve one simple scheme to control the profit on all those items.

If you ask me to state in general terms what is my position with regard to the control of profits on munitions of war, it is this. I am responsible to my shareholders for providing a fair return on the money invested. I desire no more and no less. I am prepared at any time that my own staff shall discuss, with representatives of the government, our costs of production before they place an order with us, and that we shall agree with them what is a fair return on the capital involved. Obviously, this is a question, the details of which in the public interest we could not discuss to-day, but if the Commission desires me to go into further detail on some other occasion, I shall be only too pleased to do so.

With regard to the export trade in munitions, I would remind you that, as I have already said, this business can only be taken subject to the government allowing such export, and has to be secured in the face of international competition. If and when this approval is given, I conceive it to be the duty of every British industrialist to strive to obtain a fair share of that business in order that the British industry may remain established in this country, to find employment for our people and to keep in action plant and personnel which are essential to national security.

While on the subject of the export trade in munitions, may I say that I think the present system of export licences is very useful. It enables the government to be satisfied that orders placed with British manufacturers by foreign countries may be safely executed. In my judgment, no other system provides better safeguards. It seems to me that if this system of licences were not maintained, the only choice which apparently remains is between the abolition of exports altogether or the British government and other governments would themselves have to undertake the supply of arms to friendly nations.

Linked with this question of export of munitions is a suggestion that governments have granted loans for the purchase of munitions, or in some way have subsidised the export of munitions. I am not aware that the British government has ever done anything of the sort, but I question whether the same can be said of other countries, particularly those countries where the manufacture of munitions is largely a state monopoly.

With regard to the total prohibition of all exports of munitions, I would point out that this must inevitably lead to each nation setting up its own munition factory. In this way increased capacity for production would result, and the maintenance of that plant in working condition might lead to production in excess of defensive requirements.

I have already indicated as clearly as I can the difficulties which would be encountered if it were decided to establish a state monopoly for the manufacture of munitions. If, however, the anticipating of emergency requirements involves the building of further state factories ready for operation if and when unfortunately the need arises, I would suggest that in normal conditions the government should continue to place orders with private industry to encourage the maintenance of manufacturing experience. It is also necessary that industry should be encouraged to continue research, and perhaps of even greater importance, that the developments arising out of such research should be proceeded with in order that when the industries of the country have to be mobilised in time of crisis, the results of this work may be at the disposal of the government.

It is perhaps unnecessary for me to add, in view of the past record of I.C.I., that if such a plan were adopted, we should willingly throw the whole weight of our resources, as we have always done, in assisting the government.

It was essential during the last war to have a nation-wide conscription of industry as was practised by the Ministry of Munitions. I believe it will be no less essential if we ever have to face another such war. The real foundation of the design and provision

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

of implements of modern war strength is the technical and production strength of the mechanical, metallurgical, engineering and shipbuilding industries which exist primarily to provide for the civil peace time needs of the nation, and any general policy which attempts to segregate the so-called armament provision from the industrial machine of the nation is foredoomed to failure and, in my judgment, a state monopoly would be totally inadequate as a guarantee of national security.

My suggestion, therefore (as indicated in paragraph 18 of our statement*), would be that there should be established at once a permanent supervisory body which would have to be armed with full powers and which would, with due financial safeguards, co-ordinate private manufacture and provide such auxiliary help as may be necessary where the demand is likely to be in excess of the capacity of private concerns.

If this suggestion were adopted, the procedure would be that the government would make a complete survey of the capacity of governmental and industrial concerns, and, after that survey, the government would then decide what policy should be adopted.

The supervisory board would be required periodically to take a census of production and would have to work out plans for ensuring all necessary supplies. They would have to see that adequate stocks were available, and that transport and all other services, including personnel, could be provided at short notice. They would, in fact, be responsible for doing the work which in the last war was done by the Ministry of Munitions. Their function would be to encourage industry to co-operate in the fullest possible manner with the government.

In conclusion, I think it may be convenient for the Commission if I summarise the salient points of our evidence.

1. The proportion of the I.C.I. munitions business to the whole is 1.8 per cent., and of the profits 1.4 per cent. Our interests are, therefore, obviously allied with peace conditions, and we are agreeable to such control of munitions profits as will, as hitherto, only provide a fair return on the capital involved. Detailed examination of our agreements and investments will prove that neither at home nor abroad are we by such channels interested materially in munitions.

2. We have not been parties to any "ring" but on the contrary have often found purchasers playing off one manufacturer against others with consequent unduly increased stringency of specifications and depression of prices to unreasonably low levels.

We have purchasers to estimate their own demands and have taken absolutely no part directly or indirectly in influencing against peace efforts.

3. For I.C.I. companies we claim that their services in the war period were acknowledged as invaluable and satisfactory. We manned quite a number of the largest national factories. We have had and still have idle plant at the service of the nation without subsidy of any kind. We prefer not to enter into controversy on the relative costs of private and government manufacture as to the best of our knowledge the requisite data on comparative lines are not available.

4. A state monopoly will be costly and take a long time to establish. On the other hand in many directions our industrial resources are adaptable to military needs and are a valuable asset to national security.

To have a state monopoly of the chemical industry of this country engaged in exports in competition with other countries has in our opinion only to be mooted to reveal an untenable position. We appreciate the work of the British government factories and their research, but claim that we also have made valuable contributions and often freely transfer to them our technical results, the British government always having the first, and if it desires, the exclusive claim to these.

* See p. 442, *supra*.

We have personnel experienced in military productions and now engaged on non-military work who with others will be available as in the War for transfer to emergency factories but who might not readily accept permanent government employment.

5. Exports of munitions have been adequately controlled in Great Britain by the licensing system. Our exports, while limited, in the absence of orders from the British government have been the means of keeping certain types of plant alive, although not filled, and also have kept a nucleus of personnel active.

It is not in Great Britain, but often in countries where there is a state monopoly, that loans have been granted to other countries to be taken in munitions. To forbid exports is to force the creation of factories where there are none.

6. Our considered view, and the concrete proposal which we make for normal periods, is that there should be state factories as at present, together with private industry receiving a reasonable share of orders (profit controlled). They should both be guided by an authoritative body which has surveyed the whole field; this body would be a shadow Ministry of Munitions. Behind such a plan I.C.I. will throw its whole resources. For war time we visualise nation wide conscription of industry.

This concludes my personal statement, and as I said in opening, I shall be glad to answer questions of general policy and principles, leaving if you please, questions on detail to my colleagues.

2584. *Chairman*: The next branch of the investigation is to deal with the answers to the Commission's questionnaire. There are one or two questions I should like to ask you upon your general statement and upon your own personal statement, Sir Harry, but they are only anticipatory of the questions that will be asked later. I should, however, like to clear these points up, if I may. You have dealt with the question of taking the profit out of war?

Sir Harry McGowan: Yes.

2585. *Chairman*: You have dealt with the question of excessive prices upon government orders, have you not, and have suggested that you are willing to give the government any access to your costings, and so forth, to ensure that you shall not be charging the government excessive prices?

Sir Harry McGowan: Yes.

2586. *Chairman*: Those are government orders?

Sir Harry McGowan: Yes.

2587. *Chairman*: Then later on you come to the export trade?

Sir Harry McGowan: Yes.

2588. *Chairman*: I want to ask this about the export trade. Is there keen competition in the export trade for the goods that you export?

Sir Harry McGowan: Competition takes care of those prices, Sir.

2589. *Chairman*: Competition?

Sir Harry McGowan: From various manufacturers like ourselves.

2590. *Chairman*: Which in itself will keep down the prices?

Sir Harry McGowan: Oh, surely, Sir.

2591. *Chairman*: Then when we come to deal with the agreements—I understand that I am to ask Mr. Mitchell about the agreements—but is it not the fact that all these agreements that you have made limit the competition by defining areas, and so forth?

Sir Harry McGowan: We have no agreements, Sir, on military supplies.

2592. *Chairman*: Well, is that quite accurate? *Sir Harry McGowan*: Oh, yes. We have an agreement with Du Pont as regards selling in particular areas, but nothing to do with the exchange of technical information regarding military supplies.

2593. *Chairman*: Very well, we will leave that for the moment; but your view is that there is keen competition at present in peace time with regard to your export trade?

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: Very keen.

2594. *Chairman:* Well, that deals with that. The next question I wanted to ask was this. You deal with the licensing question, and you say that is efficient and sufficient. Do you export any large quantities of your manufactures under a general licence?

Sir Harry McGowan: No; a licence is applied for and given for any particular order we get. It is not a blanket licence.

2595. *Chairman:* It is not a general licence?

Sir Harry McGowan: No, it is specific.

2596. *Dame Rachel Crowley:* You sometimes have a short-term licence, I suppose, Sir Harry, do you not?

Sir Harry McGowan: Yes, covering the particular order, Madam.

2597. *Chairman:* The only other question I wanted to clear up in my mind on your statement is with regard to this supervisory body. Your suggestion is, as I understand it, that a supervisory body should be set up at once?

Sir Harry McGowan: Yes.

2598. *Chairman:* So as to permit the machinery to come into operation immediately the emergency arises?

Sir Harry McGowan: Yes.

2599. *Chairman:* I follow that. Then there are one or two questions which I wanted to ask you on your general statement before I come to deal with the questions and answers. The first is on paragraph 10*, about the comparison of costs between government manufacture and private manufacture. You refer there to an extract from the report of a Committee of Inquiry which indicates that at the time they are referring to there was no sufficient costing system at Woolwich; but we have been down to Woolwich, and we have inquired into that, and supposing at the present moment that there is an efficient costing system at Woolwich, is there any ground for suggesting that like cannot be compared with like? Does it depend purely on the costing system?

Sir Harry McGowan: I think it depends on the basis of the costing system. At Woolwich you have an entirely different basis of costing from what we have; but in order to be compared it must be comparable, and of course it depends on the volume of the business going through a plant.

2600. *Chairman:* There was one other question which I wanted to ask. At the end of paragraph 12 you say: "It is only necessary to add that I.C.I. does not produce mustard gas nor any other lethal gas for offensive purposes, and there is a long-standing instruction within the company that it is not to do so save at the direct request of the British government." Does that mean that no mustard gas or other lethal gas has in fact been produced since the War at all by I.C.I.?

Sir Harry McGowan: Yes, that is so.

2601. *Chairman:* There has been no export?

Sir Harry McGowan: No export, Sir.

2602. *Dame Rachel Crowley:* That, of course, does not cover research, obviously?

Mr. Rogers: None of our research people are busy at all on devising poison gases for use in war.

2603. *Chairman:* Of course, that does not cover the materials out of which gas can be made; but I am only referring to the actual manufactured gas?

Sir Harry McGowan: That is correct, Sir.

2604. *Chairman:* Then we will go to the questions. I will deal with that part of the evidence myself, and I will go through it with you. I will just explain that the questionnaire which we addressed to you was the same questionnaire which we addressed to Messrs. Vickers. It is the questionnaire of the 23rd April, and your answer eventually came on the 4th October, 1935. You say:

"With reference to the accompanying letter of to-day's date, which is the formal answer to your

communication of 23rd April, 1935, I must refer to the various documents which have been sent therewith, in order that I may indicate those which are of a private and confidential nature.

"For the sake of clarity and to show how the answers to Questions Nos. 1 and 2 have been reached, the figures from which these answers have been derived have been embodied in one statement marked 'A'."

Now, Questions 1 and 2 were: "1. The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war. 2. The proportion of the turnover in each of the last five years, representing arms and munitions of war, attributable to (a) United Kingdom, (b) British Empire and (c) foreign orders."

You answered that in this way on the next page: "Question No. 1: The proportion of the total turnover in each of the last five years was, in percentages, 1.6, 2.3, 2.0, 1.6, and 1.5.

Then you answer Question No. 2 in the same way fully, and you have also given us the make-up by which you arrive at those figures; and inasmuch as you say that that make-up includes the details of your whole business, commercial as well as the munitions business, you say that it is reasonable that we should allow you to treat the make-up as confidential. We agree to that. It seems reasonable. You have given us an answer to the question, and in order to assist us you have given the make-up out of which you arrive at the conclusion so that we can test it?

Sir Harry McGowan: Yes, Sir.

2605. *Chairman:* Then I will read on. "The method adopted has involved the disclosure to the Commission of certain figures relating to all our activities, e.g., our total turnover figures. I believe you will agree it will be unnecessary, and it certainly would be misleading and prejudicial to the company's interests, for such figures to be made public. These figures are, therefore, given to the Commission on the understanding that they are treated in strict confidence and that any questions based on them which the Commission desire to ask shall be asked in camera."

Then Question 3 is: "The estimated value of plant" and the answer is £1,316,436, and you say that details of the total figure are shown in A1.

Then you go on to say: "In answering Question No. 3 we have attempted to estimate the value of property and plant employed in military products and have furnished a table which also contains confidential figures. The total figure cannot be regarded as anything more than a careful estimate. Its preparation has involved an enormous amount of work, but I must nevertheless make it clear to the Commission that it would only be possible to ascertain the exact value of the plant by having an independent valuation by competent chemical engineers. This would entail the expenditure of much more time and money". That again is a case in which you have given us the answer, and given us the way in which you have arrived at it?

Sir Harry McGowan: Yes.

2606. *Chairman:* But you wish the way you have arrived at it to be confidential to us, as a means of testing the correctness of your answer; that is right, is it not?

Sir Harry McGowan: Quite correct.

2607. *Chairman:* Then you go on to Question 4, "The amount of declared profits . . ." and so on, and you give the figures, and you say the published accounts for five years are marked "A2". Those were the published accounts?

Sir Harry McGowan: Yes.

2608. *Chairman:* Well, we have not printed those, because they are generally known.

Sir Harry McGowan: Yes, they are public property.

2609. *Chairman:* They are published as a matter of course?

* See p. 440, *supra*.

† Appendix 2, p. 466.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: Yes.

2610. *Chairman:* Then Question No. 5 is: "The average number of employees engaged in each of the last five years . . ." You have given us that, and there is no question of asking that it shall be treated as confidential there.

Going to Question 6, that is the question asking: "The firm's capacity for expansion for purposes of the production of arms and munitions of war . . ." and then you give us a long statement which you ask shall be treated as confidential, and you say that you are sure the Commission will realise that it should be treated as confidential. That is generally accepted, and I think will be accepted in view of the last document sent to us which I referred to this morning.

Then Question 7 is: "Particulars of any agreements with other firms engaged in the production of arms and munitions of war, stating the names of the parties, British and foreign, to such agreements". Now, in reference to the communications which were made in those letters, I wish to call attention to the fact that this question is not confined to asking for information about agreement with firms in reference to munitions. It is a general question. In answer to that question, both Vickers and yourselves have given us full information which includes reference to agreements which have nothing to do with munitions, and that is one of the reasons why we have treated the claim for confidence as one which we should accept, because it includes reference to agreements which have no reference at all to munitions, and were only given because of the general nature of the whole question. Your answer to that is this: "I should be grateful if the information furnished in answer to Question No. 7 could also be regarded by the Commission as confidential because a public disclosure would obviously be unfair to our partners in these agreements". Now, in regard to these agreements—and I say this because of the communications that have been made to us—you claim confidence on the ground that it would be unfair to your partners. Well, I am not sure that that is a good or sufficient answer to this question, but there are other answers, one of which is that a great many of these agreements are of no materiality to the question which we have to consider?

You go on: "We have observed, however, that the evidence of the Union of Democratic Control contained a list of agreements. We shall give in a separate document," which can be made public, details which we consider relevant concerning these particular agreements". That is attached to this document, and I shall have to go into that at some length. I understand Mr. Mitchell is proposing to answer that?

Sir Harry McGowan: Yes.

2611. *Chairman:* Then Question No. 8 is: "Details of the firm's present holdings of the capital of other firms . . ." and so forth. In regard to that you say: "The very exhaustive details submitted in reply to Question No. 8 are also by their very nature of a confidential character, and I trust that my requests that these shall be so regarded by the Commission may be granted". Well, there is a very full statement which enables the Commission to go through these various investments and decide whether there is any real materiality in making any of that information public, and we do not think there is, in the same way as we dealt with the question in the case of Messrs Vickers.

Then No. 9 is: "The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war", and you have set that out in full.

I think I have dealt with the answers now, and I did it in this way because I want to make it plain as to the way in which the Commission are dealing with these matters.

The questions which I want to ask are mainly concerned with these agreements. I will take first of all, if I may, the list* which you have taken from the statement of the Union of Democratic Control. They set out a list of 38 agreements, or suggested agreements, and that list to some extent agrees with the list which Viscount Cecil supplied† of documents which he wished us to look into. I think that this list from the Union of Democratic Control covers all the documents which Lord Cecil asked us to look into, and in this list of 38 I have already asked for an explanation of what the meaning of four of the 18 existent and four non-existent agreements means. Would Mr. Mitchell point out to me which are the firms which he is referring to when he says they are non-existent?

Mr. Mitchell: The four non-existent are these: No. 5, No. 8, No. 10, and No. 15. Those are all companies in which we have a financial interest, but no existing agreement.

2612. *Chairman:* If I look into your confidential schedule of investments I shall find these?

Mr. Mitchell: If you look in the confidential schedule of investments you will find these all cited as investments.

2613. *Chairman:* The next question I want to ask is this. Of these 38, are any of them exhibited in the proceedings in the Inquiry in the United States?

Mr. Mitchell: No, 1.

2614. *Chairman:* Is it No. 1; are you sure?

Mr. Mitchell: Yes, No. 1, and No. 2. The only two of which we have direct knowledge are No. 1 and No. 2.

2615. *Chairman:* Yes. But you will agree that it is not right that we should be asked to treat those as confidential documents?

Mr. Mitchell: No.

2616. *Chairman:* They have already been published in full in America?

Mr. Mitchell: Yes.

2617. *Chairman:* But you have produced them in your confidential schedule?

Mr. Mitchell: Yes, but I see no reason why they should not be published, as they are all public property.

2618. *Chairman:* You have made too wide an exception. There is no reason why they should be excluded in your case?

Mr. Mitchell: No.

2619. *Chairman:* Now, have you got the American proceedings, Part 5. Will you turn to page 1297, Exhibit No. 461. First of all I want to know who writes this, and to whom. It is signed by Mr. Pickard, and is addressed to the Executive Committee, from the Chairman of Foreign Relations Committee.

Mr. Mitchell: Mr. Pickard was then the Chairman of the du Pont Company's Foreign Relations Committee, and he is addressing the letter to the Executive Committee of the Company.

2620. *Chairman:* Who are the Foreign Relations Committee?

Mr. Mitchell: It is a section of the du Pont organisation.

2621. *Chairman:* And who is it written by?

Mr. Mitchell: By Mr. Pickard, the head of that section, to the subsidiary Board of Directors, so called the Executive Committee.

2622. *Chairman:* I see. Then it purports to show Imperial Chemical Industries and its subsidiary companies and investments and contractual interests in the world market, and then it is divided under headings, "Direct I.C.I. Companies", "Indirect I.C.I. Companies", "Foreign Investments", and "Foreign Alliances". The detail of this information is not included in your confidential statement?

* Appendix 1, p.465.

† See Minutes of Evidence, 1st Day, p. 31.

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Mr. Mitchell: You will notice that this document is dated March 7th, 1928, this document from Mr. Pickard, and we have given you the up-to-date information. The information which is given here is not correct.

2623. *Chairman:* It is no longer correct?

Mr. Mitchell: Yes, that is so. I am not prepared to say whether it was or whether it was not at that date. It is now quite incorrect.

2624. *Chairman:* Do I understand you to say that in preparing your confidential schedules it is now corrected, and the reason why a great deal of this information does not appear in this is because the information is no longer correct?

Mr. Mitchell: Yes, that is the exact position, Sir.

2625. *Chairman:* Some firms have disappeared, and the investments have changed?

Mr. Mitchell: We have had no regard to the American proceedings in providing you with the information you want. We have given you the up-to-date information.

2626. *Chairman:* I do not like the words "We have had no regard to it". May I take it that the information you have given us is correct?

Mr. Mitchell: Absolutely.

2627. *Chairman:* The correct information is here? The information which is in this Exhibit is either no longer available, or is incorrect?

Mr. Mitchell: That is so.

2628. *Chairman:* Very well, I understand, and I can disregard that. Then the next question is about the du Pont agreements. I want to go into the question of these du Pont agreements. That is your main selling agreement, is it not, with any foreign company?

Mr. Mitchell: Of military explosives it is the only one, except I think a small thing with Hotchkiss. We make their cartridges for them.

2629. *Chairman:* I should like to deal with du Pont, and with this Hotchkiss one, if that is also a selling agreement?

Mr. Mitchell: No, it is not, but I did not want to leave it unmentioned. We make for them.

2630. *Chairman:* I find references in the papers that have been before me, in the American papers, to a great many agreements with du Pont, dating back to a long time ago; but have all those agreements been displaced by some later agreement?

Mr. Mitchell: Yes.

2631. *Chairman:* What is the date of the latest agreement?

Mr. Mitchell: The first agreement was entered into in 1897, then there was a subsequent agreement in 1897, there was one in 1910, one in 1913, and then we had one in 1926 and one in 1929, and the latest one supersedes all those understandings.

2632. *Chairman:* That is the one of the 10/10/32?

Mr. Mitchell: Yes, 10/10/32.

2633. *Chairman:* May I take it that it now embraces your entire arrangements with du Pont?

Mr. Mitchell: That does, Sir.

2634. *Chairman:* That appears on page 1,302 of this book?

Mr. Mitchell: Yes.

2635. *Chairman:* Is it correct that that covers the whole of your arrangement existing at the time with the Pont de Nemours Company?

Mr. Mitchell: I think there is a little confusion here. I thought you were dealing with the main patents and processes agreement. There are two agreements concerned here. One is the patents and processes agreement, and one is the sales agreement. The dates I gave you before relate to the patents and processes agreements, but if you are dealing with the sales understanding, our original arrangement was in 1928 or 1929, and then it was superseded by this one, and this is the one that is for the moment supposed to be operated.

Secretary: That is also dated the 10th October, 1932.

Mr. Mitchell: Yes, that is the sales agreement, but the patents and processes agreement is a different agreement.

2636. *Chairman:* You have two agreements?

Mr. Mitchell: Yes, and the one we are dealing with is the one in front of us.

2637. *Chairman:* We will take Exhibit No. 465. That deals in paragraph 7 with the products which it covers, does it not?

Mr. Mitchell: Yes.

2638. *Chairman:* It deals with "Nitro-cellulose powders, cordite, other nitro-glycerine powders, trinitrotoluene, other simple and combined explosives for naval and military uses, nitro-cellulose for manufacture of propellant powders, and other chemical accessories for use in manufacture of naval and military powders, for example, centralite, diphenylamine, etc."?

Mr. Mitchell: Yes.

2639. *Chairman:* Then you define sales areas, and you adopt a centralised selling arrangement, and you make proposals to govern the dealing of these two companies in these proportions over these areas, and for arranging prices, and so forth?

Mr. Mitchell: Between the two parties.

2640. *Chairman:* What is the other class of agreement with du Pont?

Mr. Mitchell: The other class of agreement is the patents and processes agreement, under which we exchange territorially patents and processes as developed by the company. In other words, it is a licensing arrangement under which they exchange rights with us in certain given territories for our rights, and there is a certain common territory in which we both have equal rights. That agreement excludes military propellants altogether.

2641. *Chairman:* You mentioned the Hotchkiss agreement. I should like to know the nature of that?

Sir Harry McGowan: Perhaps Colonel Creswell could answer that.

Colonel Creswell: The Hotchkiss agreement is in effect an agreement between ourselves and three other manufacturers to divide the orders for certain Hotchkiss ammunition. Hotchkiss evolved a heavy machine gun some 10 years ago, of about $\frac{1}{2}$ -inch calibre, and they came to us to ask us to make the ammunition. Eventually some French manufacturers came in, and in order that Hotchkiss themselves should not submit inquiries to each of us in turn, Hotchkiss asked us to arrange to divide these orders between us. That is all it is.

2642. *Professor Gutteridge:* Does that mean that these four companies hold a monopoly of ammunition for the Hotchkiss gun?

Colonel Creswell: That is what Hotchkiss wish to do.

2643. *Professor Gutteridge:* For what reason?

Colonel Creswell: Hotchkiss are satisfied that we make the ammunition which will function best for their gun.

2644. *Chairman:* I understand those are the only two sales agreements you have got?

Mr. Mitchell: The only two that come within the ambit of military supplies. We have numerous others industrially.

2645. *Chairman:* I am only speaking of military supplies. You have given us the details of a number of other agreements which refer to reciprocal rights of using patents, and defining areas, and so forth. We have got the particulars of those, but there seems to be an impression that if you or any other English company desired to evade the licensing regulations, or desired somehow to cover up the real destination of some of your products, it is necessary that you should have an agreement with some foreign company—an existing agreement—to enable you to do so; but of course if you wished to do so you could without any previous agreement enter into an arrangement with some foreign firm in order to take the order. I am not suggesting you would do so, but I mean it is quite possible to do it?

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Mr. Mitchell: Yes, it is quite possible to do it.
2646. *Chairman*: It is quite as easy to evade the law without a previous agreement as it is with one?

Mr. Mitchell: I should suggest it is easier. When you have an agreement, you have a partner.
2647. *Chairman*: The existence of an agreement for the interchange of licences does not necessarily deal with the danger which is supposed to exist with regard to evading the law, or as to the real destination of a consignment?

Mr. Mitchell: No.
2648. *Professor Gutteridge*: Are you ready to export to individuals or companies, or only to governments?

Mr. Mitchell: Are you talking of military supplies?

2649. *Professor Gutteridge*: Yes.

Mr. Mitchell: It is a question of the government giving us the right. I do not think there is any restriction on the person to whom we can export if the government will give us the authority.

2650. *Professor Gutteridge*: What is the practice?

Mr. Laing: The practice is either the government, or, in a very few of these instances it may be an individual vouched for by the government.

2651. *Professor Gutteridge*: Which government?

Mr. Laing: The receiving government.

2652. *Professor Gutteridge*: The recipient government; that is the invariable practice, is it?

Mr. Laing: Invariable.

2653. *Dame Rachel Crowley*: The Board of Trade does not ask that, does it? You do not have to produce any licence from your importing man or his government before the Board of Trade gives you your export licence, do you?

Mr. Laing: No, but we make it a practice if we get an inquiry to make sure of the *bona fides* of the inquirer, and most of the governments make sure that that is so.

2654. *Dame Rachel Crowley*: But as an act of grace, and not of necessity?

Mr. Laing: Yes.

2655. *Professor Gutteridge*: May I ask a question arising out of that? You have subsidiaries in some cases?

Mr. Mitchell: Yes.

2656. *Professor Gutteridge*: Could you name them?
Mr. Mitchell: The whole list is before the Commission. What particular countries have you in mind?

2657. *Professor Gutteridge*: We have all of them, have we?

Mr. Mitchell: Yes. You have a list of the whole of them. We have an interest in—

2658. *Professor Gutteridge*: I am not speaking of that. For instance, there is I.C.I. Australia.

Sir Harry McGowan: They are a pure selling organisation.

2659. *Professor Gutteridge*: Are any of them manufacturing companies?

Sir Harry McGowan: Yes, we manufacture in Australia.

2660. *Professor Gutteridge*: War materials, I mean; I am not interested in the industrial organisation.

Sir Harry McGowan: No.

2661. *Professor Gutteridge*: Do any of them manufacture war materials?

Sir Harry McGowan: Canada does, but there we do not control the stock of their company.

2662. *Professor Gutteridge*: It is an independent organisation?

Sir Harry McGowan: Yes. We have a share holding, but we do not control.

2663. *Professor Gutteridge*: It has been suggested that one way of evading government requirements is to place the order round to some company of that kind, which will execute the order?

Sir Harry McGowan: You cannot do it.

2664. *Mr. Spender*: Supposing your Canadian branch wanted to export, would they get a licence from the Canadian government?

Sir Harry McGowan: They are the only buyers in the Canadian market.

2665. *Mr. Spender*: Is there a licensing system in Canada or Australia?

Mr. Mitchell: They are not exporters, anyhow. Those countries do not export.

2666. *Mr. Spender*: But they could export if they wanted to without having any licence?

Sir Harry McGowan: I could not tell you off-hand if a licensing system operates in Canada or Australia. I do not think so.

2667. *Professor Gutteridge*: Take South Africa?

Sir Harry McGowan: They buy from us.

2668. *Professor Gutteridge*: Then there are no military plants there?

Sir Harry McGowan: No, they have no plants.

2669. *Professor Gutteridge*: I am thinking of South Africa, because, looking at the thing in the abstract—I am not saying they do it—there is nothing to prevent the South African government buying from you and then exporting to some country to which you could not export?

Sir Harry McGowan: I think that is quite possible.

2670. *Professor Gutteridge*: Do you inquire as to the destination of exports to countries of that kind?

Sir Harry McGowan: We would not do that 'with the South African government. They might say, "That is our business"; but with continental nations we should do so.

2671. *Dame Rachel Crowley*: You would do it with foreign countries?

Sir Harry McGowan: Yes.

2672. *Professor Gutteridge*: As I understand it, there is a company in South Africa with which you have an arrangement?

Sir Harry McGowan: Yes.

2673. *Professor Gutteridge*: As I understand it, that is a territorial arrangement of some kind,—south of the River Niger, or something of that sort?

Sir Harry McGowan: Yes.

2674. *Professor Gutteridge*: Do they manufacture themselves, or do they obtain their supplies from you?

Sir Harry McGowan: They do not manufacture at all or obtain supplies. We deal direct with the South African government.

2675. *Professor Gutteridge*: They deal with no military supplies at all?

Sir Harry McGowan: No.

2676. *Professor Gutteridge*: You do not export any propellants to the South African Company at all?

Sir Harry McGowan: None whatever, but to the government there.

2677. *Professor Gutteridge*: Or other military materials?

Sir Harry McGowan: No.

2678. *Chairman*: I think there is only one other question which I wanted to ask. I see that Mr. Newbold, amongst other matters, said he thought there was an arrangement between du Pont and Kuhlmann in France?

Sir Harry McGowan: There is no arrangement of any kind with Kuhlmann except quite indirectly, in that they are in the international nitrogen cartel, and we are a member of that.

2679. *Professor Gutteridge*: May I ask something arising out of that. Is it possible for private firms to manufacture military explosives in France?

Sir Harry McGowan: No.

2680. *Professor Gutteridge*: It is a government monopoly?

Sir Harry McGowan: Yes.

2681. *Professor Gutteridge*: Are you in competition with the French government monopoly?

Sir Harry McGowan: In France, do you mean?

2682. *Professor Gutteridge*: No, elsewhere; because I have been looking at the records of the American Inquiry. I forget the actual document, but I think it is du Pont's European representative.

Sir Harry McGowan: Yes, I know what you mean.

2683. *Professor Gutteridge*: He complains that the French powder monopoly are competing with you or

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

with du Ponts in Greece. So there you have a case of a nationalised factory entering into competition with a private firm?

Sir Harry McGowan: Quite.

2684. Professor Gutteridge: The kind of thing you adumbrated?

Sir Harry McGowan: Yes.

2685. Professor Gutteridge: I do not know whether I ought to ask you this or not, but I am going to. Is it the French government factory you are thinking of in your statement when you speak of loans to be taken out in explosives?

Mr. Mitchell: The whole of the explosives industry of France is a monopoly in the hands of the government, and they hand it over to distribute to certain people; but it is all monopolised.

2686. Chairman: I did not understand that, because I thought one of the complaints in France was that the munitions industry had such an influence through the press; but if it is a state monopoly—

Sir Harry McGowan: It is only explosives, not munitions.

Professor Gutteridge: It is the Société de Fabrique Internationale, or some such name as that. 2687. Dame Rachel Crowdy: We have before us, Sir Harry, a citation of a letter which was quoted in the American Inquiry on page 1337, in Part 5 of the American proceedings, and it is Exhibit 477. The letter is to Imperial Chemical Industries, Ltd., from du Pont, and it says:—

Dear Sirs, attached is confirmation copy of our cablegram of 7th June informing you that Senor Manuel Ferreira, our agent in Paraguay, who is now in Buenos Aires, asked us for prices c.i.f. Montevideo on 200 kilos of picric acid and 2,000 kilos flake T.N.T. We also informed you in our cablegram that we could not quote from this end owing to the embargo on munitions and military propellants decreed by President Roosevelt. In view of the fact that there is no similar embargo obtaining in England, we suggested that you quote prices to your office in Buenos Aires, who in turn would advise Ferreira. Although the inquiry distinctly states that prices are wanted c.i.f. Montevideo, we suspect that the material is for Paraguay, and since we wish to co-operate with our Government in observing the embargo, we deemed it best not to quote.

That is signed by Mr. Bates for the du Pont de Nemours Company. I should like to know, if I might, whether that order was fulfilled?

Sir Harry McGowan: We did not quote at all. 2688. Dame Rachel Crowdy: Had you quoted for an order like that—and I suppose sometimes you obviously must have orders passed on to you from your affiliated organisations—to the du Pont de Nemours Company, do they get a commission from you?

Sir Harry McGowan: I have no doubt, as a general principle.

2689. Dame Rachel Crowdy: And similarly, if you passed on something to them because of an embargo, you would expect a commission from them for passing on the order?

Sir Harry McGowan: Well, we have not done it; that is the answer.

2690. Chairman: But it would come under your agreement if you did it?

Sir Harry McGowan: Yes, it would, if we did it.

2691. Dame Rachel Crowdy: Yes, if you did it.

Mr. Mitchell: It would if we did it, but we have not done it.

2692. Dame Rachel Crowdy: But it could be done under agreements with affiliated bodies?

Mr. Mitchell: Yes.

2693. Dame Rachel Crowdy: Then on page 1346, Exhibit 486, I wanted to ask you something. It is a very long letter, and I certainly will not read it; but I see from that that the Jardine Engineering

Company is acting as your agent in the Far East. They are also agents of Vickers, are they not?

Sir Harry McGowan: I think they are.

2694. Dame Rachel Crowdy: We gathered that, when they gave evidence here the other day, and I expect they are, because I see the letter says: *The Jardine Engineering Corporation are an established company in China and have been extremely successful in the military business.* So they probably do something of this kind. Do you work direct with Jardines, or does Vickers act as licensed agent for you?

Sir Harry McGowan: We work direct with Jardines—direct with Jardines the whole time.

2695. Dame Rachel Crowdy: Then again that same letter refers to a Chinese purchasing company?

Sir Harry McGowan: Yes.

2696. Dame Rachel Crowdy: You deal with that company, do you not?

Sir Harry McGowan: Do you mean in Berlin?

2697. Dame Rachel Crowdy: Yes.

Sir Harry McGowan: I do not think we have. The only orders we have got have come direct from Jardines in China.

2698. Dame Rachel Crowdy: There is something here: *I believe the only purchases made since that time have been 8 tons of cordite, which was sold by I.C.I., and 200 tons of T.N.T., which was sold . . . through the Chinese-Berlin office.*

Professor Gutteridge: Colonel Creswell was mentioned in this, and perhaps Colonel Creswell would answer?

Colonel Creswell: I do not deal with explosives.

Professor Gutteridge: You see what it says here?

Colonel Creswell: Yes.

Professor Gutteridge: Mr. Montague Smith was apparently handling military stores at this time?

Colonel Creswell: Yes. If I may say so, I am small arms ammunition, and I do not deal with these matters.

Mr. Laing: In explosives, as distinct from small arms ammunition, we for the last three years have had to deal with the purchasing commission of the Chinese Government in Berlin.

2699. Dame Rachel Crowdy: The Chinese-Berlin office is the same as the Chinese purchasing commission?

Mr. Laing: Yes, exactly.

2700. Dame Rachel Crowdy: But sometimes dealings have been going on with the Chinese Ambassador in Berlin? Is it officially connected with the Chinese purchasing company, and it is officially connected with the Chinese government?

Mr. Laing: It is really a commission in Berlin to buy supplies.

2701. Dame Rachel Crowdy: And therefore recognised by the Chinese government?

Mr. Laing: Yes, absolutely.

2702. Dame Rachel Crowdy: Then—if I may go on in connection with exports to China, which interest me rather particularly—I understood that in exporting to China it was always only on a *huckao* from Nanking for all exports, even to Nanking?

Mr. Laing: Yes. There was one exception, I think, when the Nanking government allowed us to make one shipment to Canton; but as a rule, except for that one instance—and the government knew all about it—we had a *huckao* from Nanking.

2703. Dame Rachel Crowdy: And that is the only form of licence on which you export?

Mr. Laing: Yes.

2704. Dame Rachel Crowdy: What licence did you use on the one occasion when you did not use the Nanking licence, do you remember?

Mr. Laing: My assistant tells me, on a letter from the Chinese Ambassador in London in that one instance for sending some 10 tons of, I think it was, T.N.T. to Canton. That is the one instance.

2705. Dame Rachel Crowdy: Then, when you are supplying an order from Canton, and you get your Board of Trade licence, is it always made out for

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Canton, or is it ever made out for Nanking on consignment? Can you remember any case of that at all?

Mr. Laing: The official consignee is Canton.

2706. *Dame Rachel Crowdy:* It is always Canton; there is no exception to that at all?

Mr. Laing: That is so.

2707. *Dame Rachel Crowdy:* Shall we have an opportunity, Mr. Chairman, of asking more questions later on?

Chairman: Yes, certainly, if you want to.

Dame Rachel Crowdy: Then I think I will pass from that at the moment.

2708. *Sir Kenneth Lee:* In the course of your own statement, Sir Harry, you say: "It is also necessary that industry should be encouraged to continue research". What kind of encouragement do you look for there?

Sir Harry McGowan: Well, by means of orders placed for military requirements that we are capable of undertaking.

2709. *Sir Kenneth Lee:* Would that encourage research?

Sir Harry McGowan: Yes, it certainly would as far as we are concerned, even only giving us a reasonable profit.

2710. *Sir Kenneth Lee:* You do not have in mind any contribution towards research?

Sir Harry McGowan: No.

2711. *Sir Kenneth Lee:* You say at the same time you are doing research?

Sir Harry McGowan: We are doing it in certain directions.

Mr. Rogers: Yes. For example, in connection with T.N.T. we must research. It is one of our industrial manufactures as well as being a military manufacture. I think I may perhaps add a word with regard to that. The extent to which one can develop by research in a laboratory is limited. It is always necessary in manufacture to have some real manufacture upon which to found your research, and that I think is the chief point in this, that unless one has some actual manufacture to do, the amount of research is restricted to the laboratory, which is much too limited for any practical result to follow.

2712. *Sir Kenneth Lee:* Then, Sir Harry, at the end of your statement you say that private industry in the case of an important war would be taken over and that you would throw all your weight, all the weight of your great organisation, into the production of what was necessary?

Sir Harry McGowan: Yes, surely.

2713. *Sir Kenneth Lee:* Do you contemplate any such eventuality as that your industry would be taken over in a similar way as the railway companies were taken over during the last war?

Sir Harry McGowan: Well, I could not answer that in that way, but what occurred in 1914 to 1918 would be repeated. The first call on what we produce is for government requirements.

2714. *Sir Kenneth Lee:* Then your business would be mainly producing for the government during a period of war?

Sir Harry McGowan: We would have certain peace productions going on still, as we had during the last war. During the last war we had to keep all the coal mines going by making blasting explosives.

2715. *Sir Kenneth Lee:* But the munitions business, instead of being $\frac{1}{4}$ per cent., as it is now, might be 75 per cent.?

Sir Harry McGowan: I would not like to put a figure on it, because it means extending our plant. I take it there would be an increased demand, and we should have to extend according to our increasing requirements.

2716. *Sir Kenneth Lee:* Would you agree that it would be desirable to conscript the industry?

Sir Harry McGowan: I think it would be essential to conscript in this general sense, that

whatever government required to be produced must be produced.

2717. *Sir Kenneth Lee:* But I mean much more than that. I mean control—that the industry would come under government control?

Sir Harry McGowan: Well, no, I do not think so. I do not think our factories were controlled by the government during the War.

Mr. Rogers: The question of control I think we look at in this way. The policy and the nature of the business, the nature of the production really, should be controlled in the sense that it should be entirely for government purposes, whatever these may be. It might well be to supply explosives to the coal mines, and that would have to be so to some extent; but we do not think of control of the industrial undertakings as indicating any active governing of the technical and productive activity. That must be left in the hands of those accustomed to it, and, if I may say so, those well able to do it.

2718. *Sir Kenneth Lee:* It is obvious that there could not be detailed control, but what I had in mind was this. You agree that in the event of another war it would be desirable that the state should be able to conscript not only the industries, but the workers in them, and I take it you could not conscript the workers unless you took over the plant, in the same way or a similar way as the government took over the railways in the last war?

Mr. Rogers: I should not think that was necessary. My own experience during the War with the Ardeer factory, which was not one of the present ones, was that there was no conscription in the sense that you have in mind, but it was obvious that we had to comply with whatever regulations the government issued with regard to factories generally.

2719. *Sir Kenneth Lee:* I agree, but did it not result in great inequity, in so much as there was a great inequality between the amount of money which was earned by the men who went to the front and those who remained in the factory?

Mr. Rogers: Yes.

2720. *Sir Kenneth Lee:* Is it not desirable that that should be avoided?

Mr. Rogers: If it can be.

2721. *Sir Kenneth Lee:* Do not you think conscription would avoid it?

Mr. Rogers: I am afraid I could not say. That is a very difficult problem. That might bring on difficulties that really would make things much too difficult in a time of war. I am not able to discuss that at all. But I know that if conscription meant government persons having control of private factories—actual control—it would be a failure.

2722. *Sir Kenneth Lee:* It was not a failure with the railways, was it?

Mr. Rogers: Well, I do not know about railways. I am talking about manufacturing concerns. In my view, no manufacturing concern could be operated that way, assuming it were reasonably efficient to begin with.

2723. *Sir Kenneth Lee:* You would agree that in the next war every one from the managing-director down should not get more than they would get if they were occupying similar positions in the army?

Mr. Rogers: Yes—well, if that was so all throughout the country, no one could have any objection to it.

2724. *Sir Kenneth Lee:* Would you agree that that would be desirable?

Mr. Rogers: Well, as far as I myself am concerned, I would agree, certainly, if that were the policy of the government.

2725. *Professor Gutteridge:* You were aware, of course, that there was a good deal of feeling with regard to that during the War. I can vouch for that from my own experience. I used to see men working in front of furnaces at temperatures of something like 100 degrees in the shade at their soldier's pay as foundrymen, and their mates over in

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

England were getting up to £10 a week. And we had very great difficulty in keeping those men at work. If the British soldier had not been the magnificent man he was, he would not have done it.

Mr. Rogers: I quite agree that that should be dealt with. The manner of doing it I am afraid I am not competent to suggest.

2726. *Sir Kenneth Lee:* What I am thinking of is this. If everyone was conscripted it could not be said they were desirous of war, because the managing-directors and workers in the industries affected would be very much worse off in the case of war. It would be a means of taking the profit interest out of the war?

Sir Harry McGowan: I cannot imagine any managing-director conducting his business in order to stimulate a war for his own financial benefit.

Mr. Rogers: I certainly am not desirous of any war.

2727. *Chairman:* If he had his future definitely laid out for him, he would have no choice. He would have no choice if he was definitely told that he had got to do this?

Sir Harry McGowan: That is so, of course.

2728. *Sir Kenneth Lee:* Just one other little question, *Sir Harry.* Do you subscribe to any so-called patriotic societies?

Sir Harry McGowan: What do you mean by that?

2729. *Sir Kenneth Lee:* I mean the Air League or the Navy League. Perhaps they are wrongly named, but there are organisations of that kind?

Sir Harry McGowan: Do you mean subscriptions by the company?

2730. *Sir Kenneth Lee:* Yes.

Mr. Laing: Some years ago we subscribed £10 for a life-membership of the Air League of the British Empire, and that is the lot.

2731. *Mr. Spender:* As regards control in time of war, you would accept the government payment. "We approached this question from the point of view of procedure"—I think those are the words you used—so that if the state took over control in time of war, as you suggest, you would leave to the state to decide what they thought adequate remuneration for your shareholders?

Sir Harry McGowan: Well, that would be discussed. I would not like to express any definite opinion on that point. In point of fact, during the last war the state took 80 per cent. of the profits made.

2732. *Mr. Spender:* Yes, but it is still alleged that the profit remaining was in some cases excessive?

Sir Harry McGowan: That may have been so. It could not have been so in our case, I think.

2733. *Mr. Spender:* I am not alleging it in your case. I only want to try to get it clear that you would continue to take what was called profit out of it under state control?

Sir Harry McGowan: I agree.

2734. *Mr. Spender:* With regard to agreements, may I just call your attention to a passage in the proceedings of the American Inquiry, Part 3, Exhibit No. 261, at page 681. It is a letter from Captain John Ball of the Soley Armament Company, and it is written from London on March 25th, 1934, six years after the time when you said certain previous agreements were wound up; and he says then: "We have just heard that some of the stock of 7-65 Mauser ammunition was tested last November by a Bolivian officer, Colonel Brito, who was not very pleased with the results, and who ordered new ammunition from Imperial Chemical Industries, Ltd., who control Kynoch's factory here—"here" being presumably in London. Is that correct?

Sir Harry McGowan: Kynoch's is one of our companies. It belongs to us, and is one of our subsidiary companies.

2735. *Professor Gutteridge:* That is your small arms branch?

Sir Harry McGowan: Yes.

Colonel Creswell: I think I can say with regard to that that we have taken no orders from Bolivia at all.

2736. *Sir Kenneth Lee:* You have taken none?

Colonel Creswell: I do not know what Captain Ball is talking about at all. Of course, it was not a letter written to us.

2737. *Dame Rachel Crowdy:* Did Du Pont take Bolivia, while you took Paraguay?

Sir Harry McGowan: No. Du Pont does not make military ammunition.

2738. *Professor Gutteridge:* But you exported cartridges to Paraguay, did you not?

Sir Harry McGowan: Yes, again under licence.

2739. *Chairman:* Was that a definite licence, or a general licence? You have answered that, I think. You do not have general licences, I think you said?

Sir Harry McGowan: No, we have a special licence for each order.

2740. *Professor Gutteridge:* In other words, they were exported with the express licence and with the knowledge of the British government?

Sir Harry McGowan: Yes.

2741. *Professor Gutteridge:* You were not supplying both sides—I am putting it in a general way—with regard to small arms ammunition?

Mr. Mitchell: If I may put it in general terms, I think we have not, except to the extent of £8. That is all we have supplied to the Bolivians. It was a test order of some sort, and I think it was a small ammunition order. We charged them for sending it up country.

2742. *Professor Gutteridge:* It is quite a small item?

Mr. Mitchell: Yes. We have no trade with them.

2743. *Mr. Spender:* I think that although your arms business is a very small percentage of your total business, it is intrinsically a very large business?

Sir Harry McGowan: Not from a profit point of view, or even volume. You have the details of all these orders in your hands. It is a very insignificant amount of money compared with the total.

2744. *Mr. Spender:* But it is a very important factor. You would not disagree with the statement that your share of this business is a very important element?

Mr. Mitchell: I do disagree.

Sir Harry McGowan: I do not agree with that.

2745. *Mr. Spender:* But potentially?

Sir Harry McGowan: I am dealing with the facts as we know them.

2746. *Mr. Spender:* But your general submission is, as I understand it, that though it is a small part of your business, yet potentially you are a tremendous asset to the country?

Sir Harry McGowan: Yes; I emphasise that.

2747. *Mr. Spender:* And therefore, if I understand you aright, you say it would be useless for the government to nationalise until it nationalises the whole of your industry?

Sir Harry McGowan: Yes, I think that is correct; and that, in our opinion, is physically impossible.

2748. *Mr. Spender:* And in your opinion it is physically impossible to detach the two, and your submission is that your value is a potential value of expansion to the country which applies to the whole of your industry.

Sir Harry McGowan: That is correct.

2749. *Mr. Spender:* If it was a question of nationalising or not, the government would have to nationalise the whole of your industry, or leave you alone?

Sir Harry McGowan: Yes.

2750. *Mr. Spender:* And you do not think there is any half-way house between those two things?

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: No, I do not think so.
 2751. *Mr. Spender:* You do not think your military part ought to be detached for the purpose of accounting and costing from your other activities?

Sir Harry McGowan: No, because to-day you have many warlike activities flowing into peace time activities, even to-day.

2752. *Mr. Spender:* You talked of a supervisory board; but supposing in time of peace the government were to appoint its own official nominee to your board to watch over its interests, would you regard that as desirable?

Sir Harry McGowan: It would be quite useless.

2753. *Mr. Spender:* Why useless?

Sir Harry McGowan: Because we think we are competent to run our business, and we are not sure that the government nominee . . .

2754. *Mr. Spender:* But still the government has an enormous interest in this branch of your business?

Sir Harry McGowan: Well, the country has.
 2755. *Mr. Spender:* But you do not think it would be a satisfactory way of assuring the public that all was right?

Sir Harry McGowan: No. It would not assure us. It might assure the public. It would not produce the results that we want.

2756. *Mr. Spender:* That may be a matter of opinion.

(Adjourned for a short time.)

2757. *Dame Rachel Crowdy:* Sir Harry, you made one very excellent point in your statement when you said that a great advantage of the continuation of private manufacture and private industries in your particular line was that the personnel, the plant, and the material would be available quickly in a war emergency. That was your special point, was it not?

Sir Harry McGowan: Yes.

2758. *Dame Rachel Crowdy:* Then you said that many chemical compounds are used in humanitarian and remunerative industrial directions?

Sir Harry McGowan: Yes.

2759. *Dame Rachel Crowdy:* Those, by suffering really a very slight change, could become war material presumably, could they not?

Sir Harry McGowan: Yes.

2760. *Dame Rachel Crowdy:* Your chlorine and your sulphur could become poison gas?

Sir Harry McGowan: Yes.

2761. *Dame Rachel Crowdy:* You say that you do not export lethal gas of any kind?

Sir Harry McGowan: No.

2762. *Dame Rachel Crowdy:* Do you export to warring countries, or potentially warring countries, any of these commercial products which could very easily be converted into lethal products?

Sir Harry McGowan: We export chlorine.

2763. *Dame Rachel Crowdy:* You would, for example, export to two warring countries?

Sir Harry McGowan: I cannot define what "warring countries" are; but we do export chlorine to certain countries in the world for commercial purposes.

2764. *Dame Rachel Crowdy:* And even if a country were declared the aggressor, as Japan was, for example, in the Sino-Japanese war, or the Italo-Abyssinian war, you would still be able to export, and would export, materials which could very quickly be converted into lethal materials.

Sir Harry McGowan: We would export unless stopped by the War Office here or by our government.

2765. *Dame Rachel Crowdy:* It would really lie with the government?

Sir Harry McGowan: Yes.

2766. *Mr. Spender:* Would not that be covered by a licence?

Sir Harry McGowan: I do not think that necessarily that would be covered by a licence. It might be.

2767. *Dame Rachel Crowdy:* Would the material easily convertible be covered by a Board of Trade licence?

Sir Harry McGowan: I do not think so to-day; but it might be quite easily, of course.

2768. *Dame Rachel Crowdy:* Would you see any objection to an embargo imposed on any easily convertible materials in the event of any country being declared an aggressor, declared by international decision to be an aggressor—do you see any great objection to the embargo then being put on export?

Sir Harry McGowan: I would not mind discussing that with the government. You mean with regard to export?

2769. *Dame Rachel Crowdy:* Yes; I mean for export to that country or for export and then re-export to any other country.

Sir Harry McGowan: Yes.

2770. *Dame Rachel Crowdy:* That is just as important, is it not?

Sir Harry McGowan: Yes.

2771. *Dame Rachel Crowdy:* I was going to ask you, with regard to exporting potential war material to countries which have been declared aggressors, or warring countries, have you noticed any increase in the demand from you at important times, say between 1928 and 1935 from Bolivia and Paraguay, or between 1931 and 1933 for Japan and Manchukuo—have you seen any increase in the demands on you?

Sir Harry McGowan: No.

2772. *Dame Rachel Crowdy:* Your figures have not varied very much?

Sir Harry McGowan: No.

2773. *Dame Rachel Crowdy:* I notice that actually your percentage figures for war material have gone up recently, have they not?

Sir Harry McGowan: Is that so? I thought they had gone down. That is finished material?

2774. *Dame Rachel Crowdy:* Yes.

Sir Harry McGowan: I thought you were on chlorine.

2775. *Dame Rachel Crowdy:* There is a slight confusion of the issue.

Sir Harry McGowan: I do not think we have been increasing our sales of chlorine to what you would describe as potential aggressors throughout the world.

2776. *Dame Rachel Crowdy:* You do not notice any great increase?

Sir Harry McGowan: No. We have no reason to think that what we have sent out are for warlike purposes.

2777. *Dame Rachel Crowdy:* Not even if they go to an aggressive country—I have to use that word because it is the ordinary normal word—not even if they are being supplied to an aggressor?

Sir Harry McGowan: I do not think we have done that.

2778. *Dame Rachel Crowdy:* You do not think there is any great increase?

Sir Harry McGowan: I could let you have a statement of these sales and exports. Would you like that?

2779. *Dame Rachel Crowdy:* Very much.

Sir Harry McGowan: Very well.*

2780. *Dame Rachel Crowdy:* If I might go back for one moment to the question I asked you before about licences that you get from Nanking, if you are exporting to any part of China. You quoted one particular case this morning when you had not to get the ordinary Nanking certificate. Have you ever exported on what is known as the South-Western Council certificate?

Mr. Laing: I have never heard of such a thing. We have not.

2781. *Dame Rachel Crowdy:* It has been used by firms in different parts of the world when it is perhaps not advisable or very easy to get a Nanking certificate.

Mr. Laing: We have not an instance of that kind.

* Appendix 3, p. 470.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

2782. *Dame Rachel Crowdy*: You have heard of them, though—your firm has heard of them?

Mr. Laing: Personally, I have not. I cannot recollect hearing of it at all.

Mr. Smith: The British government would never give us an export licence without a Nanking certificate, except in that one solitary instance in which case the Nanking certificate was substituted by a letter from the Legation here; so it is quite out of the question that we ever supplied on any South-Western government huchao.

2783. *Dame Rachel Crowdy*: Was that one case that you refer to in the last two years?

Mr. Smith: That was two years ago, I should think.

2784. *Dame Rachel Crowdy*: In 1933, about the time of the Japanese moving into Manchuria?

Mr. Smith: It was in 1932 or 1933.

2784a. *Dame Rachel Crowdy*: I think it was 1933. Never mind; it is not of any great importance. I find that in some of your papers you refer to the National Sulphuric Acid Association?

Sir Harry McGowan: Yes.

2785. *Dame Rachel Crowdy*: Is that a national branch of an international organisation of any kind?

Sir Harry McGowan: No; purely commercial.

2786. *Dame Rachel Crowdy*: Merely British?

Sir Harry McGowan: Yes.

2787. *Sir Kenneth Lee*: In answer to Mr. Spender, I think, to-day, you said it really was practical to separate your ordinary plant and to produce explosives as distinct from ordinary commercial articles, and in another part of the evidence it came out that the French had done it. Could you give us a little more information about that? As I understand it, the French produce all their own explosives?

Sir Harry McGowan: Military?

2788. *Sir Kenneth Lee*: Yes.

Mr. Rogers: Of course, it is possible to do it, but it would not be nearly so effective from the point of view of knowledge and capacity to expand when necessary if you did it.

2789. *Sir Kenneth Lee*: But if you had a chemical industry in addition, as the French have, to the manufacture of explosives, you would have that possibility of expansion, would you not?

Mr. Rogers: But I want to be quite clear about this.

Sir Harry McGowan: Is it a fact that the French government have a chemical industry in addition to manufacturing military explosives?

2790. *Sir Kenneth Lee*: I do not know.

Sir Harry McGowan: I thought you were going on that assumption.

2791. *Sir Kenneth Lee*: I was.

Sir Harry McGowan: I do not know.

Mr. Rogers: I am not aware exactly of what the French government have done, but I imagine that they manufacture military explosives in their factories, manufacturing such sulphuric acid and nitric acid as they want for the purpose. That is what I imagine they are doing. That, of course, is quite feasible. It was done during the War in this country—it can be done here. It is done at Holton Heath, the government factory; but in the case of a firm like I.C.I., to divorce these two things, to take away the military and put it in one place, you would lose the general knowledge and capacity and relation of one thing to another to which Sir Harry referred.

Sir Harry McGowan: And it would be more costly.

Mr. Rogers: Yes.

2792. *Sir Kenneth Lee*: I am not thinking so much about the cost; it was the point you made in reply to Mr. Spender about the practicability rather than the cost.

Sir Harry McGowan: Yes.

2793. *Sir Kenneth Lee*: I understand that the French have a dye industry.

Mr. Rogers: Yes.

Sir Harry McGowan: Not the government.

2794. *Sir Kenneth Lee*: But they have a dye industry in addition to the government explosives industry?

Sir Harry McGowan: No. Those have been separate for years.

Mr. Rogers: In this country our dyestuffs industry is absolutely apart from our explosives industry.

2795. *Sir Kenneth Lee*: In peace-time?

Sir Harry McGowan: Yes.

Mr. Rogers: I do not think that Sir Harry meant to suggest at all that the whole of our chemical industry is bound up physically with our explosives industry.

Sir Harry McGowan: No, not necessarily.

2796. *Mr. Spender*: I did not mean to suggest that you should physically actually detach your other industries or your military explosives side, but that you might, for the purpose of control and supervision, have separate auditing and costings of the two. That is not impossible, is it?

Mr. Rogers: No.

Sir Harry McGowan: With what advantage?

2797. *Mr. Spender*: From the point of view of control it might be a satisfaction to the public.

Sir Harry McGowan: I doubt that, in effect. However, that is my personal opinion.

2798. *Mr. Spender*: That is your opinion?

Sir Harry McGowan: Yes.

Mr. Rogers: It is perfectly simple of course, in production in a factory; and in fact in order to get a proper picture of what is happening in your production you must separate the various things. There is no difficulty whatsoever in accounting separately for certain things that you decide to be military.

Sir Harry McGowan: We do that to-day in our organisation.

2799. *Dame Rachel Crowdy*: You remember I brought up this morning Exhibit No. 477 in the American Inquiry; that was a case where du Pont wrote to Imperial Chemicals referring to their export to Montevideo—

Sir Harry McGowan: Yes.

2800. *Dame Rachel Crowdy*: —which you suspected was going to be diverted to Paraguay. That is on page 1337 of Part 5. You answered to my question that you had not fulfilled any order; you had refused the order?

Sir Harry McGowan: We did not even quote.

2801. *Dame Rachel Crowdy*: I should have followed that a little further and said: In your opinion, do you think it is a possible thing, an easy thing, to avoid an embargo should a firm wish to do so through the connections that firms have with each other in different parts of the world?

Sir Harry McGowan: It may be done.

2802. *Dame Rachel Crowdy*: Do you think that it makes evasion of the embargo extraordinarily easy?

Sir Harry McGowan: I do not think extraordinarily easy.

2803. *Dame Rachel Crowdy*: Extraordinarily possible, let us say?

Sir Harry McGowan: Possible, but not probable, I think.

2804. *Dame Rachel Crowdy*: You do not think there is a danger?

Sir Harry McGowan: There may be, of course.

I take it that the licensee here would look after that. I think that our Board of Trade would be very insistent on knowing the ultimate destination of the goods for which we wanted a licence.

2805. *Dame Rachel Crowdy*: That is not quite the point. Supposing that we in this country had an embargo on goods and we could not export, it seems so very probable that we should just pass the order on to a colleague in another country, get a commission, and get the order forthwith, in spite of the fact that our diplomats were fighting in Geneva, or wherever it may be they are fighting, or agreeing on an embargo in order to produce an ultimate peace.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: I concede that that is conceivable.

2806. *Dame Rachel Crowley*: You think it is?

Sir Harry McGowan: Yes, conceivable; but we have not done it.

Chairman: It is always possible to commit a crime.

2807. *Sir Philip Gibbs*: Sir Harry, you have mentioned in your preliminary statement that there has been a good deal of criticism by sincere, but probably misguided, people against the I.C.I., and I understand that you really want me to press some of those points in order that you may answer them, and we should like to do so, I think, in order to show that they have been properly considered. They raise certain moral issues and certain issues on general policy; so will you allow me to question you rather on those lines?

Sir Harry McGowan: Certainly.

2808. *Sir Philip Gibbs*: Also in your preliminary statement you say that there is a widespread fallacy that Imperial Chemicals are essentially an armaments firm, and you lay considerable stress on the smallness of your profits; but from the point of view of your critics, is not that rather like the answer of the unfortunate lady who put in a plea that her unwanted child was only a very little one? I mean that if these moral questions are involved, it does not very much matter whether your profits are enormous or only moderate, and therefore I am rather pressing some of these points. The first question which I want to ask for my own information is this: Why is it that you desire to keep secret and confidential the names of certain firms with whom you have agreements?

Sir Harry McGowan: Agreements of a commercial character?

2809. *Sir Philip Gibbs*: Yes; and agreements for the exchange of patents and secret information and for the use of certain materials.

Sir Harry McGowan: I think that is commercial practice. Why should we disclose to the world the nature of the agreements that we have with any particular company? Why should we, unless we are forced to? It is commercial practice.

2810. *Sir Philip Gibbs*: I think you will see that that may lead to certain sinister suggestions that you want to keep secret certain information. Do you think it is necessary to keep that confidential?

Sir Harry McGowan: We are keeping nothing secret from you.

2811. *Sir Philip Gibbs*: No; but there is always the public to consider, and I am looking at the case rather from your point of view as well as from ours. Would you allow me, for instance, to mention certain firms that you have omitted from the published list?

Sir Harry McGowan: Yes.

2812. *Sir Philip Gibbs*: You have arrangements with certain firms of one sort and another in many countries in the world, including Germany, Spain, and other countries. Have I your permission to mention those three firms?

Sir Harry McGowan: Do, please. May I say that this has nothing to do with munitions—military requirements.

2813. *Sir Philip Gibbs*: It seems to me so to do.

Sir Harry McGowan: It has not, I can assure you.

2814. *Sir Philip Gibbs*: That is so?

Sir Harry McGowan: Yes.

2815. *Sir Philip Gibbs*: Then I am mistaken, because I read in your evidence and in your confidential memorandum that these firms have reciprocal exchange of improvements and patents with you.

Sir Harry McGowan: What firms?

2816. *Sir Philip Gibbs*: For instance, Rheinisch Westfälische Sprengstoff A. G.

Sir Harry McGowan: Purely commercial.

2817. *Sir Philip Gibbs*: What is the meaning of the word "Sprengstoff"?

Sir Harry McGowan: "Explosives."

2818. *Sir Philip Gibbs*: But surely they are capable of producing military explosives?

Sir Harry McGowan: They may be; I could not tell you; but the nature of our agreements with that company are commercial and not military.

2819. *Sir Philip Gibbs*: Not military?

Sir Harry McGowan: Not a bit.

2820. *Sir Philip Gibbs*: Very well; I accept that instantly. Bearing on that question, I should like to ask you whether these firms with which you have arrangements, and which you say are purely for commercial purposes, are not capable of instantly being converted into military production?

Mr. Rogers: As this is a technical matter, perhaps I might be allowed to answer your question. It is obvious, I think, from Sir Harry's evidence that any explosives firm is capable of making things of value in some degree or other for military purposes; and the same applies to these German firms you speak of. Any agreements that exist, any arrangements that they have, do not deal with the final military things; but it is obvious, of course—May I perhaps explain it to you in this way: I will take as an instance the case of a detonator for setting off the blasting charge in mining. If there is an invention in regard to that it is highly probable that it is an invention which has some bearing or other on detonators which are also used for military purposes.

2821. *Sir Philip Gibbs*: But with one firm you have a very definite arrangement enabling them to manufacture certain cartridges, and that is an Italian firm called Bombrini-Parodi Delfino.

Chairman: If you will look at your schedule you will see it is No. 2 on the first page, Class 1. I think that is the Hotchkiss agreement to which you referred.

Colonel Creswell: The Hotchkiss company wished for certain reasons to license that firm in Italy to make their guns. They also wished us to license them to make their cartridges, to give them the technique of that one cartridge so that it could be made in that country.

2822. *Sir Philip Gibbs*: I imagine you were helping them to produce a considerable quantity of these Hotchkiss cartridges, for use in a war which this particular nation seems to disapprove of very strongly.

Colonel Creswell: Five years ago—that agreement has expired.

2823. *Sir Philip Gibbs*: When did it expire?

Colonel Creswell: On the 10th November, 1935. I may say that if we had not shown them how to do it, someone else would have done.

2824. *Sir Philip Gibbs*: I think that is not a good argument; but we will not go into that at the moment. I think, Sir Harry, these rather vague charges made against your firm are really due to a sort of anxiety in the public mind because they imagine, rightly or wrongly, that you are in control of a widespread organisation of chemical firms which could instantly get to work to create explosives in any part of the world where there happens to be a spot of trouble. Do you agree with that definition?

Sir Harry McGowan: No, not for a moment.

2825. *Sir Philip Gibbs*: And you do not think, for instance, that whereas one side of your firm is engaged in fertilising the fruits of the earth, the other side is equally ready to blast that growth off the face of the earth at any particular moment?

Sir Harry McGowan: We have made our position quite clear in our statement of evidence.

2826. *Sir Philip Gibbs*: There are one or two points on which I should like to question you with regard to that; because it does seem to me that your agreement with du Pont does share up the world between you for the purpose of military propellant sales, powders, and so forth, for explosives, and that when there is trouble in certain countries like China and Japan, either you or the du Pont people do fulfil those orders. Is that so?

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: We are not alone in making those military articles; there is much competition from other people. All we do is to arrange a selling organisation with du Pont to make the business that we do in those countries economic.

2827. *Sir Philip Gibbs:* But also, of course, in order to get as many orders as you can?

Sir Harry McGowan: We certainly want them, for the reasons that I have stated in my evidence.

2828. *Sir Philip Gibbs:* Arising out of this du Pont agreement, there seem to have been certain considerations a few years ago as to whether you should get Germany to come within the terms of this arrangement. Is that so?

Sir Harry McGowan: Again commercial.

2829. *Sir Philip Gibbs:* I do not think so. It particularly mentions military propellants and detonators.

Sir Harry McGowan: Would you mind repeating your observation, please?

2830. *Sir Philip Gibbs:* My question was this: whether you were contemplating entering into an arrangement between yourselves and du Pont with Germany in order to get Germany into a selling organisation for the world?

Sir Harry McGowan: No.

Mr. Mitchell: That is not so.

2831. *Sir Philip Gibbs:* It seems to be borne out by certain correspondence published in the American Inquiry.

Sir Harry McGowan: Have you the reference there?

2832. *Chairman:* My recollection is that there was a question about meeting German competition.

Mr. Mitchell: Yes. May I suggest that *Sir Philip* may have in his mind a clause in one of the letters which indicated that if and when Germans were free to come back on to the market it might be necessary for us to re-consider this arrangement.

2833. *Chairman:* That is so.

Mr. Mitchell: That was the point; but there was no suggestion of any kind that we should associate ourselves with the Germans.

2834. *Sir Philip Gibbs:* It is Exhibit No. 1,000 in Part 12, and there is a passage on page 2881. It says:

We discussed at length the general question of the possibility of an agreement of some kind among military manufacturers, and we both thought that, while such an agreement might be possible as far as the manufacturers themselves were concerned, that due to the political situation in Europe to-day and due to the general attitude towards arms manufacturers, any attempt to make a formal agreement among manufacturers would cause the loudest and most violent criticism and put us in a very disagreeable position. We would be accused of joining together to foment wars, increase armaments, etc.

That is from a gentleman named Mr. William Taylor, and it is dated May 25th, 1934.

2835. *Chairman:* I think that the passage that *Sir Philip* wanted was the one you mentioned. There is a discussion between you and du Pont as to what is to happen if the Germans become manufacturers again?

Mr. Mitchell: Yes.

2836. *Chairman:* And you say that if they do, the basis of the present arrangement might have to be re-considered.

Mr. Mitchell: Might have to be re-considered.

2837. *Sir Philip Gibbs:* Yes, that is it.

Mr. Mitchell: There is no suggestion in that that we had any intention of getting together with the Germans. The suggestion was that we and du Pont might have to alter the basis of the understanding.

2838. *Sir Philip Gibbs:* I think I must question that point, because there was a considerable correspondence with regard to a Mr. Giera, whom I want to mention later, and the correspondence was to the

effect that Mr. Giera was appointed in order to expand this arrangement with the Germans with regard to military propellants.

Mr. Mitchell: I think you will find in dealing with that correspondence, that the moment we heard of the appointment *Sir Harry* protested to du Pont at the appointment of Mr. Giera.

2839. *Sir Philip Gibbs:* I want to come to that rather later on, in connection with the question of agencies; but at the moment you deny that there was any suggestion from Imperial Chemical Industries and du Pont for appointing an agent to bring Germany within your selling arrangement for the world?

Mr. Mitchell: Certainly.

2840. *Chairman:* I have the letter now; it is Exhibit No. 516, on page 1243 of Part 5. It is from *Sir Harry McGowan* and is written to Mr. Lamont du Pont:

I much appreciate your apprising me of the appointment of Mr. Giera as your agent for Germany. In the event of orders materializing I assume that these would be definitely for requirements of the Republic of Germany and not for re-export, although I do not think the agreement safeguards you in this respect.

In making the agreement I am sure you could not have had before you a resumé of the conversations between Colonel Taylor and my people when the military agreement in general was discussed and worked out. It is clear from our records that although Germany, Austria and Hungary are not dealt with in the agreement, the understanding is clearly that, as and when the Treaty of Versailles is modified, the whole position as at present covered by the general military agreement should be reviewed.

Although our German friends have been out of the export military business for many years, they probably have manufactured for local requirements, and I think we may assume that they have not been idle in their research. It is definitely established that they have not been so in military detonators. I feel sure that when freedom to manufacture is granted for home use and possibly for export they will expect to take a prominent position in the business and one which will be in keeping with our arrangement with them on blasting explosives, and we have in fact kept in mind this possibility.

If the agent you have appointed, therefore, is at all active, I think that any future negotiations would tend to become more difficult and the Germans would probably consider that as we each reserve to ourselves orders from our respective Governments they should be entitled to do likewise.

2841. *Sir Philip Gibbs:* Thank you. Is not that a direct statement that you did have that idea in your mind?

Mr. Mitchell: No. I wrote the letter at the time for *Sir Harry* to sign, and I had no such thought in my mind. It was merely that we were warning this man that he was making a bad business move in appointing an agent in Germany, in view of possible developments in the future.

2842. *Sir Philip Gibbs:* But you did not object to the idea that you should get Germany within that world-wide arrangement?

Mr. Mitchell: Eventually it may be; it depends on developments.

2843. *Sir Philip Gibbs:* May I ask whether you have made such an arrangement with any German agency?

Mr. Mitchell: No, we have not.

2844. *Sir Philip Gibbs:* May I ask you why you appointed the firm of Jardine as your agents in China when you had an office in Shanghai?

Sir Harry McGowan: I suppose we thought he might be more efficient in handling this particular business.

2845. *Sir Philip Gibbs:* May I ask you whether there was any feeling of delicacy in your mind as

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

to, perhaps, the impropriety or, at any rate, the inadvisability of selling military propellants and explosives to the Chinese government when in other parts of China you were selling things for the purpose of agriculture, and so forth?

Sir Harry McGowan: No. I have no delicacy of feeling in that matter at all.

2846. *Sir Philip Gibbs:* Not the slightest?

Sir Harry McGowan: No.

2847. *Sir Philip Gibbs:* It is rather borne out in one or two passages that you rather considered it was not a good thing to act the part of Jekyll and Hyde (if I may say so) in China.

Sir Harry McGowan: If the Chinese government wanted munitions we were ready to supply them, with the permission of the British government.

2848. *Sir Philip Gibbs:* I quite understand that everything you do is entirely within the British licence system; but, of course, we have to consider whether that system ought not to be altered and controlled.

Sir Harry McGowan: Yes.

2849. *Sir Philip Gibbs:* There is rather an interesting letter which I should like to read out. It is Exhibit 471 on page 1316 of Part 5. Have you found that reference?

Sir Harry McGowan: Yes.

2850. *Sir Philip Gibbs:* This is a letter from Mr. Laing who, I believe, is here to-day.

Sir Harry McGowan: Yes.

2851. *Sir Philip Gibbs:* To Mr. White of du Pont?

Sir Harry McGowan: Our own agent in New York.

2852. *Sir Philip Gibbs:* It says:

Dear Mr. White: Mr. Haley, of I.C.I., China, had a talk with me to-day with reference to the difficulty that the Jardine Engineering Corporation have met in working the new military agreement. They say that it is really a most difficult thing to go to the buyers and suggest that it is a matter of indifference to them whether our manufacture or du Pont's is ordered. They indicate that good salesmanship consists in definitely offering one thing or another. This does not mean that where the buyer has a preference it would not be met, but assuming he has no particular preference they do want to mention the one or the other. My suggestion is that as regards Cordite they can quite definitely mention us. In T.N.T. I think a similar policy should apply. As regards nitrocellulose powder, however, I suppose du Pont should be mentioned, but always assuming that they are willing to meet the competitive prices.

Is not that rather a suggestion that you are sharing up the market in these things, and that you have certain rights with the du Pont people for certain powders, and that, whatever sales are made by the du Pont people, they should be shared between yourselves. It seems to me an arrangement which enables you to make profits out of sales in any part of the world by arrangement with du Pont for explosives. Am I correct in making that statement?

Chairman: You had a common management, had you not, under your arrangement and a definition of territories.

Mr. Laing: That is right.

2853. *Chairman:* You worked your business under that arrangement?

Mr. Laing: That is correct.

2854. *Chairman:* And this letter is suggesting to the agent that he had better not mix up the two people, but one should quote for powder and one for explosives?

Mr. Laing: It means this, that when one goes to sell a powder the agent could sell either du Pont's manufacture or I.C.I.'s manufacture, and he was sometimes asked which do you want me to buy. Cordite is the British government powder,

and I.C.I. know how to make cordite, perhaps, better than nitro-cellulose powder. With regard to nitro-cellulose powder, du Pont's perhaps have more technique in that direction. The agent would say to the customer: Take your choice. That comes under a joint selling arrangement which was instituted to cut down the expenses of this business in which prices have become very low. There are many other competitors.

2855. *Sir Philip Gibbs:* I notice a letter from the London office of du Pont to Major Casey, director of sales in the United States of America, dated 14th August, 1933. It is Exhibit No. 486, at page 1346 of Part 5 of the American proceedings. It deals with your arrangement with the Jardine Engineering Corporation, and it says: *Through them I.C.I. has received constant and very large orders for cartridges.* Referring back to a point I asked you a moment ago, here is a passage which I think you will find rather interesting: *I.C.I. feel it advisable in view of their non-military business in certain provinces which are not in sympathy with the Nanking Government not to handle the military business directly through I.C.I. Shanghai.* Do not you think that rather bears out what I was saying, that there was a question in your mind of what I might call propriety or delicacy?

Sir Harry McGowan: After all, that letter was written by du Pont's man to his people in Wilmington. I did not write the letter, and I am not responsible for what he says in the letter.

2856. *Sir Philip Gibbs:* But it is rather curious that these people, who are very closely in touch with your organisation, should have had that thought in their minds?

Sir Harry McGowan: Ah; I have no doubt a very serious misinterpretation.

2857. *Sir Philip Gibbs:* Very well. I just wanted to bring that point out. I hope you do not mind me pressing these points?

Sir Harry McGowan: Not at all.

2858. *Sir Philip Gibbs:* You say in your preliminary statement: "I deny that my Company has ever done anything to hinder the British or any other government's efforts for universal peace or has suggested to any foreign government that they should buy more than they themselves think they need." But, of course, under the licence system granted by the British government you do try, do you not, to get the biggest orders possible from any part of the world?

Sir Harry McGowan: Yes, surely.

2859. *Sir Philip Gibbs:* And I suppose those orders are likely to materialise in those parts of the world which are most troubled by the fear of war?

Sir Harry McGowan: That may be.

2860. *Sir Philip Gibbs:* And you do not hesitate, I think, as a good business man, to promote those orders?

Sir Harry McGowan: Yes, I do.

2861. *Sir Philip Gibbs:* You do hesitate to promote them?

Sir Harry McGowan: May I deal with that? I have here a letter addressed by one of my people to Colonel Taylor, du Pont's man, dated the 5th December, 1929:

"We have now given further consideration to your letter of 14th November and we must say that we have certain misgivings about wholly agreeing with the policy which you have had approved. In instances in South America where Governments have talked of setting up a factory for the manufacture of Propellant Powders, we have in agreement with your people, suggested the alternative, namely, the laying down of a stock for a period of years, part of it to be renewed, approximately, yearly, and paid for accordingly. We consider, however, that it is a different matter altogether as regards countries where there is no threat of setting up a factory and where indeed there may be no real demand for stocks. We do not think that we should

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

take the responsibility of so to speak creating a demand. If it is a case of a country asking for the powder then the position is altogether different, but we feel that if we are the prime movers in suggesting more than stocks for defensive purposes and encourage European countries to take stocks, which left to themselves they would not order, then we do lay ourselves open to the charge from the League of Nations or from our own Governments that we may be justly accused as armament firms have been accused of in the past of making war possible or easier. The possession of ample military stores may sometimes cause a country to be more aggressive than would otherwise be the case. You will understand that this letter is not meant to be a criticism of the decision for which you have received approval, but we do think it is not unreasonable to question whether, according to the spirit that is operating nowadays, your Government and ours would look with disfavour on methods that savour of creating demands for the sake of orders and the consequent manufacture without due regard to the development of the Peace atmosphere."

This is a very strong document.

2862. *Sir Philip Gibbs*: That is very impressive; but there are certain indications, at any rate, in certain correspondence between you and your friends that that has not always been your policy, and that you have been anxious as a business man to increase the sale of explosives and munitions of war in any country which was able to buy them, and you have gone after that business, if I may say so, rather keenly?

Sir Harry McGowan: Business offering, surely. We have gone after business offering.

2863. *Sir Philip Gibbs*: I should like to suggest you have actually gone out very keenly to create business.

Sir Harry McGowan: Could you give me an instance?

2864. *Sir Philip Gibbs*: I must confess there is a slight weakness in quoting what people have written to you.

Mr. Mitchell: Thank you.

2865. *Sir Philip Gibbs*: But these are people who are very familiar with your business. In one letter from which I previously quoted it says: *I.C.I. are trying to solve the Far Eastern question to the best of their ability.*

Sir Harry McGowan: Who writes this?

2866. *Sir Philip Gibbs*: It is Exhibit 486. May I read it again: *I.C.I. are trying to solve the Far Eastern question to the best of their ability.* Does that mean you were trying to create peace in the Far East?

Sir Harry McGowan: Surely not. It is not our job to create peace.

2867. *Sir Philip Gibbs*: No?

Sir Harry McGowan: We knew certain business was offering and we wanted that business to come to our country.

2868. *Sir Philip Gibbs*: But it does look as if you were rather keen, and when you were trying to settle the Far Eastern question it really means, of course, you are trying to get as many sales as are possible owing to the conflict between Japan and China, does it not?

Sir Harry McGowan: I repeat we knew certain business was offering. It came to us by inquiry from the Chinese government and we quoted and tried to get that business for this country. We do not go to China and try and stimulate the government to order what they do not require.

2869. *Sir Philip Gibbs*: No, but of course that raises a very large question as to what they should require in certain cases?

Sir Harry McGowan: That is for them to decide, surely.

2870. *Sir Philip Gibbs*: For instance, I want to put it to you that you were endeavouring to get business

with Japan, but that it was very difficult to do so because the Japanese make a good many of their own materials of war, but that you did deal, according to one of your correspondents, in certain specialities.

Sir Harry McGowan: Yes.

2871. *Sir Philip Gibbs*: Those specialities, whatever they may have been, were for the invasion, no doubt, of Manchukuo.

Sir Harry McGowan: Yes.

2872. *Sir Philip Gibbs*: And at the very same time you were supplying the Chinese with the same materials of war in order to repel that invasion?

Sir Harry McGowan: Yes.

2873. *Sir Philip Gibbs*: I am not endeavouring to make a personal attack on you, but the critics and the people in the world who deplore the dangerous condition of the world think that this system of private sales abroad does increase the danger by providing an aggressive nation with weapons it desires and at the same time supplying the defending nation with the weapons they need for their defence, and thereby increasing the quality and the quantity of the world's explosive force.

Sir Harry McGowan: I think I answer that in my own evidence by saying that if private manufacture is stopped, then it is obvious to us that nations will put down their own plant.

2874. *Sir Philip Gibbs*: But rather ineffectively, perhaps?

Sir Harry McGowan: I do not know. With science as it is to-day I do not think we could accept that statement. There are many people capable of putting down plant of a very efficient character in any part of the world, and we feel, I repeat, that if private manufacture was stopped it would result in government factories with a great over-capacity of what they want for defensive purposes. That is the answer, I think.

2875. *Sir Philip Gibbs*: It is certainly an answer which wants a lot of examination, but I think it might be fairly argued that this private traffic in the material of war, at any rate at the present time, does increase both the quantity and the quality of the machinery of slaughter in the world.

Sir Harry McGowan: That is a matter of opinion.

2876. *Sir Philip Gibbs*: That, of course, is rather a theoretical argument.

Sir Harry McGowan: Yes.

2877. *Sir Philip Gibbs*: But that, I think, is really at the basis of certain attacks which have been made upon your firm.

Sir Harry McGowan: It may be.

2878. *Sir Philip Gibbs*: And I am very glad, of course, to give you an opportunity of answering them.

Sir Harry McGowan: Thank you.

2879. *Sir Philip Gibbs*: May I ask you whether you know a gentleman named Soong?

Sir Harry McGowan: I do.

2880. *Sir Philip Gibbs*: I think you will agree with me that he has been called the keeper of the purse in China?

Sir Harry McGowan: He was for a time, but not now.

2881. *Sir Philip Gibbs*: It is stated in the correspondence which has been published in the American Inquiry that you saw a good deal of Soong during his visit to Europe. Is that so?

Sir Harry McGowan: It is so. What do you mean by a good deal?

2882. *Sir Philip Gibbs*: Several times.

Sir Harry McGowan: Yes, I admit that.

2883. *Sir Philip Gibbs*: May I ask for what purpose?

Sir Harry McGowan: Certainly. T. V. Soong was very anxious indeed that my company should put down a plant for the manufacture of sulphate of ammonia in China.

2884. *Sir Philip Gibbs*: Did you go out to China?

Sir Harry McGowan: I went to China after seeing him in London. As you said he was the

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

keeper of the privy purse, until one fine night he was not, and I did not get the contract.
2885. *Sir Philip Gibbs*: You did actually go to China afterwards in order to—

Sir Harry McGowan: No, no.

2886. *Sir Philip Gibbs*: . . . to follow your acquaintance.

Sir Harry McGowan: No, I had a desire to go to China before seeing him in London. He came over for the World Economic Conference. We have a very large business in peaceful products in China, and I make it a point, as chairman of the company, to travel the various parts of the world where we have organisations, and I took China in my stride. That is all. There I did discuss with them the erection of this plant, but nothing came of it. I was rather glad.

2887. *Sir Philip Gibbs*: At that time you were making rather heavy sales to China, were you not?

Sir Harry McGowan: Of what?

2888. *Sir Philip Gibbs*: Explosives.

Sir Harry McGowan: What kind of explosives?

2889. *Sir Philip Gibbs*: I cannot give you their technical names.

Sir Harry McGowan: Military?

2890. *Sir Philip Gibbs*: Yes.

Sir Harry McGowan: I doubt it; I do not think so.

2891. *Sir Philip Gibbs*: I think so from certain documents I have.

Sir Harry McGowan: Ammunition?

2892. *Sir Philip Gibbs*: Yes.

Sir Harry McGowan: Yes.

2893. *Sir Philip Gibbs*: I rather wanted to ask you the reason for your association with Vickers in China.

Sir Harry McGowan: As regards selling? I am afraid I could not answer that.

Mr. Laing: The Jardine Engineering Corporation were agents for Vickers, I think I am correct in saying, before they were agents for us. The Jardine Engineering Corporation might get orders for small arms and give the orders to us or to Vickers, who might, in turn, order from us, or from some other body. That position had to be cleared up. There is nothing to it. That is all I can say about it. They were joint agents for the two of us.

2894. *Sir Philip Gibbs*: It seems to me a linking up between two very powerful combinations in the world, namely, I.C.I., and Vickers, who, between them, really do actually control very vast amounts of what I should call explosive power; and I understand that the orders you received through Vickers in China were rather heavy; they amounted to considerable sums of money.

Sir Harry McGowan: Do you suggest this association was prejudicial to some one?

2895. *Sir Philip Gibbs*: I think it might be interpreted as being rather dangerous.

Sir Harry McGowan: From what point of view?

2896. *Sir Philip Gibbs*: I feel myself that it is little dangerous to the world that enormous private combinations should get together to exploit the military needs of the world.

Sir Harry McGowan: So far as I am concerned, I object to the word "exploit" in connection with I.C.I.

2897. *Sir Philip Gibbs*: Develop.

Sir Harry McGowan: I do not like the word "exploit", anyhow.

2898. *Sir Philip Gibbs*: Then I will withdraw that word.

Sir Harry McGowan: Thank you.

2899. *Sir Philip Gibbs*: You do not agree that there is some kind of danger?

Sir Harry McGowan: Not for a moment.

2900. *Sir Philip Gibbs*: Very well. Then with regard to Exhibit 486—I seem to be referring to that a good many times—it says, referring to your firm: They handle Japan in a different way and believe it should not be handled by the same people as are handling China. Have you got that?

Sir Harry McGowan: Yes.

2901. *Sir Philip Gibbs*: Why not?

Sir Harry McGowan: Again I am not prepared to accept what Mr. Taylor says to his people in Wilmington as representing our views of the situation.

2902. *Sir Philip Gibbs*: I will ask the Chairman's ruling on this. I rather fancy I am entitled to ask you questions on points like that which have been raised by your correspondents.

Chairman: No one objects to you asking the questions, but the answer is that they are not responsible for the opinions of the writer.

Sir Harry McGowan: That is so; it is not our correspondence.

Sir Philip Gibbs: I agree to that.

Sir Harry McGowan: He is not our employé.

Chairman: You can ask whether he agrees with the opinion of the correspondent, but you cannot attach the opinion of the correspondent to the I.C.I.

Sir Harry McGowan: No, you cannot.

2903. *Sir Philip Gibbs*: No; I draw a clean distinction between them, but I should have thought I was entitled to ask whether you agree you did handle Japan in a different way?

Sir Harry McGowan: It may be so.

2904. *Sir Philip Gibbs*: May I suggest possibly that the reason was that you wanted to handle Japan through different people because you felt it was rather awkward to be selling arms to both sides?

Sir Harry McGowan: No, I have no objection at all to selling arms to both sides. I am not a purist in these things.

2905. *Sir Philip Gibbs*: But there must have been some reason why you wanted different people to handle your orders in Japan?

Sir Harry McGowan: Jardines are not in Japan.

2906. *Sir Philip Gibbs*: I mean to say that applies to your own agents, of course.

Sir Harry McGowan: Yes.

2907. *Sir Philip Gibbs*: That is to say, you were dealing in China through Jardines.

Sir Harry McGowan: Yes.

2908. *Sir Philip Gibbs*: But you wanted to deal with Japan from a different angle.

Sir Harry McGowan: It may have suited us better. That is purely internal management—that is all I can say—for us to decide, what kind of representation we have of the firm in selling our products in any part of the world.

2909. *Dame Rachel Crowdy*: Might I suggest you felt you had to have rather more sophisticated agents in Japan?

Sir Harry McGowan: It might be.

2910. *Sir Philip Gibbs*: I would like to ask another question. These questions may sound impertinent, but they are not meant to be, in my mind.

Sir Harry McGowan: I am sure they are not.

2911. *Sir Philip Gibbs*: There is another of these very awkward letters from other correspondents in which they seem to report very closely upon your business. I think it is, again, Exhibit No. 486.

Sir Harry McGowan: This is quite a famous letter.

2912. *Sir Philip Gibbs*: It is again about this dispute, and refers to Mr. T. V. Soong. It says: *Confidentially, Sir Harry McGowan has been in touch very closely with T. V. Soong during his whole visit and is going himself early in September—that is 1933—to China to see T. V. Soong on the spot to try to make the most out of the connection started in England.* We have already dealt with that; but I wanted to ask you one question. Does not that rather suggest to the minds of unpleasant people that it is necessary to have a political pull in order to get orders in this particular form of business?

Sir Harry McGowan: I do not think for a moment that is so. I was told by our people in China that T. V. Soong would be the man who

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

would handle negotiations for the erection of this particular plant. That is why I saw him. It was not munitions at all.

2913. *Sir Philip Gibbs*: Not munitions?

Sir Harry McGowan: No, no; a fertiliser—sulphate of ammonia.

2914. *Sir Philip Gibbs*: Was he not also paymaster for any munitions material?

Sir Harry McGowan: He may have been. I cannot tell you that.

2915. *Sir Philip Gibbs*: I am told from other sources that at that time he did hold the purse strings in China.

Sir Harry McGowan: He was chancellor of the exchequer in China at that time.

2916. *Sir Philip Gibbs*: Therefore he would be responsible as paymaster for any explosives material?

Sir Harry McGowan: Are you talking of military now?

2917. *Sir Philip Gibbs*: Yes.

Sir Harry McGowan: I suppose he would. Why not? Someone must pay for the goods.

2918. *Sir Philip Gibbs*: It must be useful for a business man to get in touch with that particular man.

Sir Harry McGowan: I think it is quite useful.

2919. *Sir Philip Gibbs*: Are you at all responsible for the personal and moral character of your agents?

Sir Harry McGowan: I am afraid not. It is a big job.

2920. *Sir Philip Gibbs*: Do you look at all into their credentials?

Sir Harry McGowan: Of course we do—you mean commercial credentials?

2921. *Sir Philip Gibbs*: And, I imagine, their general character.

Sir Harry McGowan: What do you mean by that?

2922. *Sir Philip Gibbs*: I mean that you would not deliberately appoint an agent who had, let us say, been a resident in Portland.

Sir Harry McGowan: I think not. I am sure not.

Chairman: Outside the jail or inside the jail?

2923. *Sir Philip Gibbs*: But I imagine that you do not have much control over the character and credentials of the agents whom you share with du Pont.

Sir Harry McGowan: We exercise all the control we possibly can.

2924. *Sir Philip Gibbs*: There was a gentleman previously mentioned by me named Mr. Giera, and he was recommended to you by Mr. Felix du Pont as an agent?

Sir Harry McGowan: Go on, Sir.

2925. *Sir Philip Gibbs*: Did you know—I imagine you did not, of course—that he was an international spy by name Brenner and that he had acted as agent for 13 different countries, that he was used by the Germans to mine the Dardanelles and Heligoland, and that he was working in close co-operation with von Papen and Bey-Ed in the United States of America before the end of the War?

Sir Harry McGowan: Mr. Mitchell knows more about that than I do.

2926. *Sir Philip Gibbs*: Can you answer that, Mr. Mitchell?

Mr. Mitchell: I knew nothing about that until I saw the result of the American Inquiry. I would like to put right one point. He never was our agent. He was recommended to us by du Pont and our letter protested, not because of his incapacity but because we thought it was a wrong move. He was never our agent, he was never appointed.

2927. *Sir Philip Gibbs*: May I read you the letter? Exhibit 522, page 1237.

Chairman: Is it worth pursuing?

Sir Philip Gibbs: Yes, I think it is rather important. It is a letter dated February 9th, 1933, from Mr. Lamot du Pont to Sir Harry McGowan. It says

Dear Sir Harry: We have made an agreement in the nature of an agency appointment with Mr. E. D. Giera, looking toward the sale of military propellants to the Republic of Germany. I understand that Germany is excluded from our understanding with respect to sale of military explosives in Europe, under which we keep each other advised of our movements, but we feel that it is desirable that we should inform you in this case. I am enclosing herewith a copy of the agreement with Mr. Giera, which speaks for itself, and which I understand covers the entire understanding between him and us. . . .

and so on. You did acknowledge that letter?

Mr. Mitchell: Yes. And to the best of my recollection Sir Harry McGowan said he was very glad to have this letter and to read of the appointment of Mr. Giera as an agent for du Pont. But Sir Harry at the same time pointed out that it was a mistake to make that appointment, in his judgment.

2928. *Sir Philip Gibbs*: Because, I think, at that moment of the Treaty of Versailles.

Mr. Mitchell: Because of the Treaty of Versailles and because of the interference with the Germans in their own market—looking forward to the future. That is the basis upon which it was put. 2929. *Sir Philip Gibbs*: The point I was making was this, that you are not in control in any way of the type of character who may be appointed as agent—of whom you might hear between yourself and du Pont.

Sir Harry McGowan: Oh, yes. I would not say that. We had no idea of this man's history at all. We objected to his appointment for other reasons. We take very great precaution ourselves in appointing our agents. They must be people of the highest standing.

2930. *Sir Philip Gibbs*: Even in the South American countries?

Sir Harry McGowan: Oh, yes. We appoint the best we can get. I will put it that way.

2931. *Sir Philip Gibbs*: You have, perhaps, not very much direct control of those agents in the Latin-American countries?

Sir Harry McGowan: If they are our own agents, we have.

2932. *Sir Philip Gibbs*: They are the best agents you can get?

Sir Harry McGowan: Oh, surely.

2933. *Sir Philip Gibbs*: Do you think it advisable to exchange secrets with foreign firms?

Sir Harry McGowan: Secrets covering what?

2934. *Sir Philip Gibbs*: Secrets covering new inventions for propellant powder, detonators, or for chemical processes which may be used for war purposes.

Sir Harry McGowan: Mr. Rogers will deal with that.

Mr. Rogers: You are referring, doubtless, to the du Pont company?

2935. *Sir Philip Gibbs*: I am referring especially to some of these other firms.

Mr. Rogers: Do you wish to take this broadly, as a question of transferring secret information?

2936. *Sir Philip Gibbs*: Yes.

Mr. Rogers: The term "secret" in that sense is used entirely to represent a "know how," &c.—a method that has not been patented. "Patents and secret processes" means patents and any other information that you happen to have; in many cases the information that is exchanged is in no way secret.

2937. *Sir Philip Gibbs*: For instance, supposing you were to discover some rather important new combination of chemicals, would it be within your agreement to exchange that chemical information with that Italian firm, Bombrini-Parodi-Delfino?

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Mr. Rogers: I am not quite clear to what agreement you are referring.

2938. *Sir Philip Gibbs:* No. 2 in Class 1—the Hotchkiss agreement that has already been mentioned.

Mr. Rogers: That particular agreement had nothing at all to do with chemical processes. It was for a specific purpose, as Colonel Creswell has said.

2939. *Sir Philip Gibbs:* What about the Rheinisch Westfälische, in which you agreed to exchange patents and secret information?

Mr. Rogers: That is for commercial explosives. We have had many agreements of that sort in the past with various explosives firms in various parts of the world. Naturally, in the position in which we are, being responsible not only for almost all the industrial explosives produced in this country, but also for South Africa to a great extent, we have to be up to date, and it is perfectly clear that we would not be up to date if we depended entirely on our own inventive capacity. We must get processes that other people have, and as soon as we get them they will want the processes that we have. These agreements of which you are speaking are merely those which allow for a situation in each case in which you have the world knowledge, so that the business may be run properly and efficiently. They mean nothing more than that. You understand, there are no arrangements of that kind regarding munitions?

2940. *Sir Philip Gibbs:* As a man who knows nothing about chemistry, I have a sort of secret anxiety lest the line between commercial explosives and military explosives should be extremely thin.

Mr. Rogers: I have already explained to you that any secret information or knowledge of a process which is mainly applicable to an industrial explosive is also applicable to a military one. The basis of the explosives is the same, whatever you are going to use them for.

2941. *Sir Philip Gibbs:* That does, to my mind, create a sort of danger that you are passing on information which might lead to further development of explosive power for very unpleasant purposes. Great stress has been laid in your statement upon arrangements for purely commercial explosives, but I think in the opinion of the world generally no distinction is drawn and it seems to be impossible to draw a distinction.

Mr. Rogers: Oh, no. It is a matter of degree. I do not want to attempt to deliver a lecture on the manufacture of explosives or their nature, but it is not the case that an explosive used for industrial purposes can simply be turned over in the right way and used for military purposes, except in very exceptional cases, but the basis of the explosives being the same they are, of course, connected. There is no dispute about that. That must be agreed.

2942. *Sir Thomas Allen:* I do not want to cover any of the ground of criticism as outlined by Sir Philip. I want rather to deal with the statement of your company's evidence, also with the particular statement that you read to the Commission, on the broad question of policy generally. In paragraph 3 of your main statement* you say that the total sales of military products in the last five years are only 1·8 per cent. I notice that relatively the number of your employees is 1 in 43. Are we to understand from that that the wages costs are higher in the munitions section or is the production of munitions a more costly form of enterprise?

Mr. Rogers: May I be quite clear? You wish to know why the relation of employees to the amount of business is different in the two cases?

2943. *Sir Thomas Allen:* Yes.

Mr. Rogers: It is a fact that, generally speaking, the wages cost of making munitions is higher than that of making industrial explosives, but I am not quite clear at the moment as to the extent. Are you taking the amount of work in 1934?

2944. *Sir Thomas Allen:* No, I am referring to your answer to Question 5 with regard to the total number of employees.†

Mr. Rogers: I must be clear exactly where this is.

Mr. Mitchell: If you compare the percentage relationships of the two figures you will find they are almost identical.

Mr. Rogers: It depends upon which year you take.

2945. *Sir Thomas Allen:* I am taking the average over the five years.

Mr. Rogers: I should like to make it clear that the employees mentioned here have been taken as a whole; they are all the people, in whatever works they happen to be. If one wanted to make an exact comparison between the number of people employed in military production and in industrial, one would have to take the separate factories and the separate things. I think you have included in this the ammunition as well as the explosives. These things are made in different works. I do not think you can take these figures as being anything but orders of figures. They are not comparable in that sense.

2946. *Sir Thomas Allen:* Then in paragraph 4 of your main statement you say:

“To remove any misunderstanding it should be stated that, in addition to their present moderate capacity engaged in the manufacture of such products, I.C.I., with the full knowledge and desire of H.M. Government, are without subsidy maintaining for use, or in a condition capable of rapid installation for use in case of national emergency, certain plants for military explosives and small arms ammunition. These have not been employed since 1918.”

When you state “with the full knowledge of the government” are we to understand that you mean at the government's request?

Mr. Rogers: Oh, yes, definitely.

2947. *Sir Thomas Allen:* They are kept idle at the government's request?

Mr. Rogers: They are kept idle perhaps because the government does not give any orders to fill them, but the government have been anxious that we should not dispose of them.

2948. *Sir Thomas Allen:* What I want to get at is this: Are they idle at the request of the government to meet an emergency?

Mr. Rogers: May I explain what is meant by that? The easiest way is to take one case, that of the Ardeer factory, where we make cordite. At the end of the War we had a very large cordite capacity, which had been put up for the government. Then our industrial demands increased and we altered our factory arrangements for industrial explosives in the interest of efficiency and gradually ate into the area that was used for the military. We used the ground. The government were very anxious that we should not dispose of any plant. If we had to do so, thereby reducing our potential capacity, we had to inform the government. We hold certain plants which can be used in emergency. The government know of that and are anxious that we should do so.

2949. *Sir Thomas Allen:* And no subsidy is forthcoming?

Mr. Rogers: No subsidy is paid at all.

2950. *Sir Thomas Allen:* In paragraph 5 you say “But it must be apparent that there is hardly an industry in the country that is not interested in materials for military activities”. Is your point that no line of demarcation can be made between civil and military activities either in peace time or war time?

Mr. Rogers: I think the intention there is to make it plain that a war is carried on not only through the possession of explosives and guns, but through the possession of boots, shoes—every sort of thing.

* See p. 439, supra.

† Appendix 2, p. 468.

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

2951. *Sir Thomas Allen*: I observed that in answer to a previous question Sir Harry said that it was not possible to separate armament production from other business. What I wanted to know was this: Does Sir Harry advance this principle as peculiarly applicable to your own industry or as a general principle with regard to all industries?

Sir Harry McGowan: I can only speak for our own industry.

2952. *Sir Thomas Allen*: In paragraph 6 you point out that any business that you do in armaments is done in open competition with manufacturers of other countries and always by British government licence, and that the materials supplied are materials considered necessary by friendly nations for purposes of national defence. To whom are you referring when you say "friendly"?

Sir Harry McGowan: I would say the British government determine which nation is friendly to us—we do not determine that.

2953. *Sir Thomas Allen*: I take it that Japan and China are both friendly to the British nation—or we might regard them as such?

Sir Harry McGowan: Yes.

2954. *Sir Thomas Allen*: Yet they might be at war with each other?

Sir Harry McGowan: Yes.

2955. *Sir Thomas Allen*: I only wanted to understand what you meant by "friendly" in that particular instance.

Sir Harry McGowan: I should say friendly in the opinion of the government.

2956. *Sir Thomas Allen*: In the same paragraph you say that the list of agreements submitted disposes of the claim that I.C.I. is directly or indirectly party to what has been designated an "international armaments ring". How would you define a "ring" in that connection, as distinct from any arrangements which you have?

Sir Harry McGowan: I would say that a "ring" connotes nearly all manufacturers of a particular product inside that ring, whereas we—there is evidence—have only arrangements with one or two people.

2957. *Sir Thomas Allen*: That would be your definition?

Sir Harry McGowan: After all, there is any amount of competition apart from ourselves and du Pont, so there can be no international ring. There is not an international ring.

2958. *Sir Thomas Allen*: In respect to any international arrangement—a ring or otherwise; call it an "understanding" or what you will—how far, in peace time or in war time, are those arrangements helpful to the British government?

Sir Harry McGowan: Are you talking from the military point of view or commercially?

2959. *Sir Thomas Allen*: From the military point of view.

Sir Harry McGowan: We have none—no agreement.

2960. *Sir Thomas Allen*: No arrangement at all?

Sir Harry McGowan: No, we have no agreement covering the technical side or the production side of military requirements.

2961. *Sir Thomas Allen*: But you are makers of military necessities?

Sir Harry McGowan: Of course we are.

2962. *Sir Thomas Allen*: My point is this, that in the event of an outbreak of war any international arrangement would be rather detrimental than otherwise to the British government.

Sir Harry McGowan: We have none; we have no arrangement that could be detrimental to the government.

2963. *Sir Thomas Allen*: That is your answer?

Sir Harry McGowan: Oh, yes, surely.

2964. *Sir Thomas Allen*: Then in paragraph 7, so far as I.C.I. is concerned you refute any suggestion that attempts have been made to stimulate arma-

ment business by newspaper propaganda, or by insinuating that others are purchasing armaments. You do advertise, I take it?

Sir Harry McGowan: Oh, yes.

2965. *Sir Thomas Allen*: What object is there in an advertisement, other than that of stimulating business?

Sir Harry McGowan: To show various foreign governments that we are in the line of business, that if they want to come to us they can. But may I say that our total expenditure in advertising military and naval products over a period of five years was £550. So we cannot be accused of extravagance in that direction.

2966. *Sir Thomas Allen*: Reverting to a point put by Sir Philip with regard to South America: I understand that your agents there are military agents, as distinct from civil.

Sir Harry McGowan: We have our own company there, our own selling organisation.

2967. *Sir Thomas Allen*: In paragraph 8 you remark that His Majesty's Government have regarded private enterprise as a vital asset in the successful defence of the country. I take it that you would agree that this is bound to be the case as long as the government is dependent upon a firm like yours for its munition supplies.

Sir Harry McGowan: Oh, surely. They are not dependent upon us completely to-day, you know.

2968. *Sir Thomas Allen*: Perhaps we will come to that a little later on. How would any change dissipate the collective potentialities of a private industry?

Mr. Rogers: I am not quite clear as to your meaning. May I have your question again, please?

2969. *Sir Thomas Allen*: How would any change dissipate the collective potentialities of a private industry as distinct from a national industry?

Mr. Rogers: You mean if the production of military material were nationalised?

2970. *Sir Thomas Allen*: Yes.

Mr. Rogers: It would simply mean that the government would not have a nucleus of people trained at all in the manufacture of military munitions.

2971. *Sir Thomas Allen*: Not if they passed through a national factory?

Mr. Rogers: Oh, yes; they would have to depend entirely on what they had in their own factories.

Sir Harry McGowan: But those factories would be standing idle for a considerable part of the year in peace time?

2972. *Sir Thomas Allen*: They would be producing, I take it, all the armaments required, idle and otherwise.

Mr. Rogers: The government would lose whatever value there is in the private manufacture of munition of war. Of course, if you assume that the national factories would be just as efficient and would not require to depend at all upon the value of industrial advance, then it might make no difference.

2973. *Sir Thomas Allen*: Is there any reason to presume that they would not be as efficient?

Mr. Rogers: I should say so.

2974. *Sir Thomas Allen*: That is your view?

Mr. Rogers: The industrial advance is so great.

2975. *Sir Thomas Allen*: In his supplementary statement Sir Harry says, "I beg the Commission to pause before they recommend anything which would destroy this vital asset to the country's safety". I take it you would not deny the obligation of the state to assume any function of private enterprise where the retention in private hands was proved to interfere with the general rights of the community.

Sir Harry McGowan: The state can do anything, can they not? That is the answer.

2976. *Sir Thomas Allen*: I presume by "vital asset" you mean your own particular organisation.

5 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: Yes, I do.

2977. Sir Thomas Allen: I would like to deal—paragraph 10 of your main statement*—with the question of the relative cost of production of private enterprise and of government factories, more particularly during the War period. You say in your supplementary statement†, “We prefer not to enter into controversy on the relative costs of private and government manufacture, as to the best of our knowledge the requisite data on comparative lines are not available”. Would you elaborate that for us a little, that we may have in our minds the clearest possible picture of what is meant?

Mr. Rogers: It is rather difficult, if I may say so, because your questions are not specific, and I feel that I can only answer them by making something which is almost equivalent to a sort of lecture, if you will pardon me.

2978. Sir Thomas Allen: I do not know how I can make them more specific. Shall I repeat what I have said?

Mr. Rogers: Yes, if you please.

2979. Sir Thomas Allen: Taking your main statement, paragraph 10. You are referring there to the relative cost of production of private enterprise and of the government factories, and you say that true comparisons are well nigh impossible, owing to varying conditions and the wide differences in methods of costing. I am asking whether you would elaborate that for us a little, that we may have a clearer vision of the picture that you want to present to us.

Mr. Rogers: In manufacturing industries, even comparing units in one industry—in our own, for instance—it is essential that the accounting systems should be similar. Much more is it likely that the systems are not similar if you are comparing a government department with an industrial corporation. What we mean is that not only are the systems of accounting different, and therefore not comparable, but also the volume of business, the volume of manufacture, may be different, and that, of course, has a tremendous influence on the cost. I do not think that I could elaborate it really more than that. It is merely a statement that they are not comparable, to begin with, because the accounting systems are different, and, again, the volume of manufacture is probably different.

2980. Sir Thomas Allen: I take it you have seen the figures submitted by Dr. Addison, who came before us. Comparative costs were submitted to us. Would you agree then that where comparative costs were available there was something to be said in favour of the Ministry of Munitions vis-à-vis private production?

Mr. Rogers: Not on equal quantity of production. I had a good deal of experience of that during the last war, and my statement is that an industrial corporation such as Imperial Chemical Industries, manufacturing the same quantity of material as a government institution, will do it at a lower cost.

2981. Sir Thomas Allen: We were glad to hear you express your willingness at any time to go into the question of profit with the government in regard to national supplies, but our trouble is rather different. The strongest argument that is put up to us against a private system of manufacture of implements of war is the incentive to profit making which the international trade affords. How would you overcome the external difficulties? Say that you were willing to meet the government on the internal difficulties.

Sir Harry McGowan: Competition takes care of the prices we get abroad. There is very intensive competition, and a scramble for business, which as a rule means a very low scale of selling prices.

* See p. 440, *supra*.

† See p. 446, *supra*.

2982. Sir Thomas Allen: You think that meets the situation?

Sir Harry McGowan: I think it does—unfortunately.

2983. Chairman: I have been requested to ask you some questions and I would like to put them now, in case I forget them. The first one is this: “Reference has been made to documents 486, 487 and 488 in Part 5 of the American Inquiry, as showing an arrangement between I.C.I. and du Pont for eliminating competition and keeping up prices. Would I.C.I. state what are the present arrangements with du Pont as regards sales of war material in Europe?” You have answered that, have you not, by saying that all the sales arrangements are covered by the document of 10th October, 1932?

Mr. Mitchell: I might elaborate that point by saying that we have already discussed with Mr. du Pont the advisability, solely on economic grounds, of ceasing this kind of activity. It pays neither of us. But pending the decision of this Commission Sir Harry decided that nothing should be done, for fear of misunderstanding.

2984. Chairman: The last existing arrangement is that of 10th October, 1932?

Mr. Mitchell: Yes.

2985. Chairman: To the next question I should have thought the answer was obvious, but they wish to have it. “What is the purpose of the firm’s numerous investments in foreign firms?” You have given us a list of the foreign firms in which you have investments and the question is: Why did you do it?

Mr. Mitchell: We thought it was a good investment for our money. If I may illustrate by the Czecho-slovakian investment, that may give the clue. The Czecho-slovakian government asked us to erect an industrial explosives factory for them. We supplied the technique and put up the factory and we took a share investment in the company for the work done.

2986. Chairman: That is a specimen case, in answer to the question why do you invest in foreign companies?

Sir Harry McGowan: Because we think it is a wise thing to do.

2987. Chairman: Why is it wise?

Sir Harry McGowan: Ah!

2988. Chairman: I will try to answer the question. First of all, I suppose, because it gives you an opportunity of seeing how the particular company is doing, if you are a shareholder.

Sir Harry McGowan: Each case is judged on its merits.

2989. Chairman: And another reason, I suppose, is because you may think it is a good investment as it stands.

Sir Harry McGowan: Yes.

2990. Chairman: And you may think that if there is a war it may be a better investment.

Sir Harry McGowan: I cannot answer that.

2991. Chairman: The third question is this: “What are the relations of I.C.I. with the I. G. Farbenindustrie and other German companies?”

Mr. Mitchell: We have close technical and other touch with the I. G. Farbenindustrie in other activities but nothing in the domain of military activity. It is a comprehensive term for the whole of the German chemical industry. We are members with them of the world cartel for dyes and the international cartel for nitrogen. We have no military arrangements with them. And with the Dynamit-Actien-Gesellschaft, which is a subsidiary of the I. G. Farbenindustrie, we have an arrangement for industrial explosives only.

Sir Harry McGowan: We collaborate with the I. G. Farbenindustrie with regard to the extraction of oil from coal.

2992. Chairman: Another question is this: “With reference to the Exhibits 496-504 inclusive of the American Arms Inquiry, Volume 5, will I.C.I. state

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

what was the exact position of Carames, why money had to be paid to him and why the factory was not constructed in the Argentine?"

Mr. Mitchell: This is going back 15 years. I think the Argentine factory was suggested some 15 years ago. We quoted for that factory through the medium of Carames. The German Köln-Röttweil A.G. secured the business through the firm of Retienne, but Retienne could not fulfil their obligations and the construction of the factory broke down for that reason. We had in the meantime

withdrawn from the negotiations—we and du Pont. The Germans secured the contract to erect the factory, but when the time came they could not do it. 2993. *Chairman:* Why had money to be paid to Carames?

Mr. Mitchell: As an agent for the company.

Secretary: All this correspondence is in 1931, 1932 and 1933.

Mr. Mitchell: He was simply paid for his services.

(Adjourned.)

APPENDIX I.

OBSERVATIONS OF MESSRS. IMPERIAL CHEMICAL INDUSTRIES LTD.

ON

AGREEMENTS CITED BY THE UNION OF DEMOCRATIC CONTROL

(Vide Minutes of Evidence, 7th and 8th Days, pp. 196-7.)

Reference No.	Agreement.	Explanatory Remarks.
1	E.I. du Pont de Nemours on patents and processes.	Referred to in list for Commission, Class III.
2	E.I. du Pont de Nemours on sales arrangements.	Referred to in list for Commission, Class I.
3	Solvay & Co. concerning chlorine and chemical interchange.	This probably refers to an agreement with Solvays for technical and commercial co-operation in the alkali field. It involves no military questions. Probably the term "chlorine" has been interpreted as indicating potential military use.
4	I.G. Farbenindustrie concerning interchange of information on nitric acid.	There is no such agreement.
5	Belgian Explosives Group re ownership	We have no agreement with this Group relating to ownership. Our only financial interest in any of the Belgian explosives companies is 29.89 per cent. shareholding in S.A. d'Arendonck, which company manufactures industrial explosives only.
6	Société Française Dynamit	This presumably is meant for Société Centrale de Dynamite or Société Nobel Française with whom we have an unwritten understanding as regards our respective territories for the sale of industrial explosives.
7	Carboncherie Française—obviously Cartoucherie Française.	They do not manufacture military explosives. We have a 23.3 per cent. share interest in this company. We have an agreement with them referred to in list for Commission, Class III, governing the manufacture and sale by C.F. under licence of sporting cartridges and cases.
8	Hungarian Explosives Co.	We have a 12 per cent. shareholding. This company manufactures no military explosives.
9	Norsk Sprængstofindustri re interchange of chemical information.	An agreement with this company is referred to in list for Commission, Class III, and is simply a sales and agency agreement, relating solely to industrial explosives.
10	Roumanian Explosives Co.	We have a 20 per cent. shareholding. This company manufactures no military explosives.
11	Union Espanola de Explosivos re interchange of information.	Referred to in list for Commission, Class II.
12	Comptoir Français de l'Azote	We have no direct association with these people but they are members of the international nitrogen cartel.
13	Coswig re limitation of sales	We have no agreement with Coswig, but there is an agreement between D.A.G. and Coswig regulating quotas and prices for Coswig's business in Chile, Bolivia and the Dutch East Indies in industrial explosives and detonators. This is the same agreement as that referred to under No. 22 below with Westfälische Anhaltischen Sprengstoff A.G. Coswig is merely a place name of this company.
14	Montecatini	The only agreement we have with Montecatini relates to urea-formaldehyde resins and moulding powders. They are, of course, members of the international nitrogen cartel.
15	Czechoslovak Explosives, Limited	We have a 32 per cent. interest in this company, which makes both industrial and military explosives.
16	Barbier Group re abstention arrangements	We have an agreement with the Barbier companies regulating territories for the sale of industrial explosives and accessories. This company manufactures no military explosives.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Reference No.	Agreement.	Explanatory Remarks.
17	Poudreries Reunies re sales	We have an agreement with these companies and others belonging to the Belgian group of explosives manufacturers regulating sales of industrial explosives. This agreement is referred to in list for Commission, Class III.
18	S.A. de Dynamite de Matagne re sales	
19	Société Belge de la Dynamite Nobel re abstention.	
20	Casale Ammonia Co. re interchange of information.	
21	Etab. Kuhlmann re abstention arrangements...	This probably relates to an agreement long since expired between this company, Società Italiana Ricerche Industrial and United Alkali Company relating to the use in the United Kingdom of the Casale process of manufacture of ammonia.
22	Westfälische Anhaltischen Sprengstoff A.G. re sales.	There are a number of agreements with Kuhlmann relating to sodium sulphide, saltcake, dyestuffs, resins, nitrochalk, etc. No military explosives are made.
23	Poudrerie Royale de Wetteren-Coopval re sales	See No. 13 above.
24	Norsk Sprængstofindustri A/S re abstention...	See Nos. 17, 18, 19 above.
25	Rheinisch Westfälische Sprengstoff re sales and exchange of technical information.	See No. 9 above.
26	Dervant & Huguenin re dye production ...	This may refer to agreement in list for Commission, Class II, relating to licences under patent in respect of Tetrazene cap compositions for ammunition, and Eschbach detonators.
27	Remington	This name should be Durand & Huguenin with whom agreements exist covering licences to B.D.C. to manufacture certain dyes. No military explosives are made.
28	Vickers re use of I.C.I. powder	Agreements in list for Commission, Class III, covering licences under patents in respect of ammunition with Tetrazene caps and sporting ammunition and components.
29	United Alkali re oxidation of ammonia ...	Agreements with Vickers relating to sales of ammunition are cited in list for Commission, Class I and Class II.
30	Allied Chemicals re finance	See No. 20 above.
31	Società Italiana Ricerche Industrial re abstention and markets arrangement for Casale ammonia.	No agreement exists with this company.
32	British Government and I.C.I. (F. & S.P.) Ltd. and British Dyestuffs Corp., Ltd.	See No. 20 above.
33	I.C.I. and Badische Co.	This may perhaps refer to the government guarantee of debentures to Synthetic Ammonia & Nitrates, Ltd. at Billingham and the shareholding which the government had in the Dyestuffs Corp. prior to the formation of I.C.I.
34	I.C.I. and Jardine Engineering Co.	An agreement exists relating to exchange of licences between Scottish Dyes and Badische in respect of certain colouring matters.
35	I.C.I. and Jardine Matheson & Co.	The Jardine Engineering Corp. are our agents for explosives and military ammunition in China.
36	I.C.I./Mitsubishi	Jardine Matheson & Co. are our agents for industrial explosives and accessories in China.
37	I.C.I./Royal Dutch Shell	We have no agreement of any kind with Mitsubishi.
38	I.C.I. and Lurgi Corp.	This presumably refers to the international hydrogenation patents agreement, to which Royal Dutch Shell are parties. I.C.I. has no direct agreement with the Royal Dutch.
		We have no agreement with Lurgi Ges. für Chemie und Huttenwesen m.b.H., which presumably is the company referred to.

SUMMARY.

Of the 38 agreements cited by the Union of Democratic Control it will be seen that 18 are non-existent as agreements. Of these 18 four refer to investments of ours in explosives companies, and it should be noted that of the remaining 20 agreements four only are related to munitions.

APPENDIX 2.

STATEMENT SUBMITTED ON BEHALF OF MESSRS. IMPERIAL CHEMICAL INDUSTRIES LTD.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF
AND TRADING IN ARMS,
8, Buckingham Gate, S.W.1.
23rd April, 1935.

Sir,

I am directed by the Royal Commission on the Private Manufacture of and Trading in Arms to transmit to you the enclosed copy of the Royal

Warrant of Appointment of the Commission, and to request that they may be furnished for the purposes of their Inquiry with full information under the following headings relative to Messrs. Imperial Chemical Industries Ltd., and any subsidiary companies under their control:—

1. The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war.

5 February, 1935.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

2. The proportion of the turnover in each of the last five years, representing arms and munitions of war, attributable to (a) United Kingdom, (b) British Empire and (c) foreign, orders.

3. The estimated value of plant employed in the production of arms and munitions of war that would be rendered redundant in the event of the establishment of a State monopoly.

4. The amount of declared profits of each of the last five years; and an estimate of the proportion thereof attributable to the production of arms and munitions of war.

(The above to be accompanied by published accounts for the five years.)

5. The average number of employees engaged in each of the last five years on the production of arms and munitions of war, and other products, respectively.

6. The firm's capacity for expansion for purposes of the production of arms and munitions of war (a) with, (b) without, the use of plant normally employed on other products. What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war?

7. Particulars of any agreements with other firms engaged in the production of arms and munitions of war, stating the names of the parties, British and foreign, to such agreements.

8. Details of the firm's present holdings of the capital of other firms, giving names (British and foreign), and of the holdings of the firm's capital by other firms, giving names (British and foreign).

9. The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war.

The phrase "arms and munitions of war" should be interpreted for the present purpose as including all the articles enumerated under headings (i) to (xx) of Article (1) of the Arms Export Prohibition Order, 1931 (S.R. & O., 1931, No. 413) and (b) vessels of war of all kinds, together with arms, ammunition and implements of war mounted on board vessels of war and forming part of their normal equipment. Copy of the Order-in-Council referred to is enclosed for convenience of reference.

I am at the same time to request that you will nominate a representative or representatives to appear before the Royal Commission for the purpose of giving oral evidence.

I am to add that a further communication will be addressed to you in the event of the Royal Commission desiring evidence in regard to other matters that may arise in the course of their Inquiry.

I am, Sir,

Your obedient Servant,
(Sgd.) EDWARD TWENTYMAN.

Sir H. McGowan, K.B.E.,
Chairman.

Messrs. Imperial Chemical Industries, Ltd.,
Millbank, S.W.1.

Imperial Chemical Industries, Limited.

From the Chairman (Sir Harry McGowan, K.B.E.).
Millbank, London, S.W.1.

4th October, 1935.

The Secretary,
Royal Commission on the Private
Manufacture of and Trading in Arms,
8, Buckingham Gate, S.W.1.

SIR,

With reference to the accompanying letter of to-day's date, which is the formal answer to your communication of 23rd April, 1935, I must refer to the various documents which have been sent therewith, in order that I may indicate those which are of a private and confidential nature.

For the sake of clarity and to show how the answers to Questions Nos. 1 and 2 have been reached, the figures from which these answers have been derived have been embodied in one statement marked "A".* The method adopted has involved the disclosure to the Commission of certain figures relating to all our activities, e.g., our total turnover figures. I believe you will agree it will be unnecessary, and it certainly would be misleading and prejudicial to the Company's interests, for such figures to be made public. These figures are, therefore, given to the Commission on the understanding that they are treated in strict confidence and that any questions based on them which the Commission desire to ask shall be asked *in camera*.

In answering Question No. 3 we have attempted to estimate the value of property and plant employed in military products and have furnished a table which also contains confidential figures. The total figure cannot be regarded as anything more than a careful estimate. Its preparation has involved an enormous amount of work, but I must nevertheless make it clear to the Commission that it would only be possible to ascertain the exact value of the plant by having an independent valuation by competent chemical engineers. This would entail the expenditure of much more time and money.

I am sure that the Commission will realise that the answer to Question No. 6 discloses information which His Majesty's Government would no doubt also consider should be regarded as strictly confidential.

I should be grateful if the information furnished in answer to Question No. 7 could also be regarded by the Commission as confidential because a public disclosure would obviously be unfair to our partners in these agreements. We have observed, however, that the evidence of the Union of Democratic Control contained a list of agreements. We shall give in a separate document, which can be made public, details which we consider relevant concerning these particular agreements.

The very exhaustive details submitted in reply to Question No. 8 are also by their very nature of a confidential character, and I trust that my request that these shall be so regarded by the Commission may be granted.

As to the answer to Question No. 9, I also suggest that the part of this document detailing sales for each country should not be published. The position of these countries has to be considered, and the necessity for details is met by the figures which have already been made available in the information published by the Government based on the report of the export licences which have been issued.

To assist you in meeting our requests for privacy, we have marked the documents "Private and Confidential—not for Publication," which we request should be so treated.

I am, Sir,

Your obedient Servant,
(Sgd.) H. McGOWAN.

Imperial Chemical Industries Limited,
Millbank,
London, S.W.1.

4th October, 1935.

The Secretary,
Royal Commission on the Private Manufacture
of and Trading in Arms,
8, Buckingham Gate, S.W.1.

SIR,

In further reply to your letter of the 23rd April, 1935, I have to forward you the Company's answer to the questions contained in that letter:—

* Not printed.

† Appendix I.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Question No. 1.

The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war.

ANSWER.

		Per cent.
1934	...	1.6
1933	...	2.3
1932	...	2.0
1931	...	1.6
1930	...	1.5

Question No. 2.

The proportion of the turnover in each of the last five years representing arms and munitions of war, attributable to (a) United Kingdom, (b) British Empire, and (c) foreign, orders.

ANSWER.

PERCENTAGE OF TURNOVER ON MILITARY PRODUCTS TO TOTAL TURNOVER.

	UNITED KINGDOM.	BRITISH EMPIRE.	FOREIGN.
	Per cent.	Per cent.	Per cent.
1934	... 72	... 23	... 64
1933	... 70	... 10	... 1.46
1932	... 68	... 11	... 1.25
1931	... 63	... 36	... 63
1930	... 46	... 54	... 50

Question No. 3.

The estimated value of plant employed in the production of arms and munitions of war that would be rendered redundant in the event of the establishment of a State monopoly.

ANSWER.

£1,316,436.

(Details of this total figure are shown in A1.)*

Question No. 4.

The amount of declared profits of each of the last five years; and an estimate of the proportion thereof attributable to the production of arms and munitions of war. (The above to be accompanied by published accounts for the five years.)

ANSWER.

	AMOUNT OF DECLARED PROFITS.	PROPORTION ATTRIBUTABLE TO ARMS AND MUNITIONS OF WAR.
	£	Per cent.
1934	... 7,965,038	1.1
1933	... 7,663,945	1.8
1932	... 6,415,423	2.1
1931	... 4,668,685	0.8
1930	... 5,129,757	1.1

(Published accounts for five years are marked A2.)*

Question No. 5.

The average number of employees engaged in each of the last five years on the production of arms and munitions of war, and other products, respectively.

ANSWER.

	ENGAGED ON PRODUCTION OF ARMS TOTAL, AND MUNITIONS OF WAR.
1934	... 41,736
1933	... 35,854
1932	... 30,610
1931	... 30,117
1930	... 34,476

Question No. 6.

The firm's capacity for expansion of the production of arms and munitions of war, (a) with, (b) without, the use of plant normally employed on other products. What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war.

ANSWER.

See statements annexed—"B",* "C",* "D",* and "E".*

Question No. 7.

Particulars of any agreements with other firms engaged in the production of arms and munitions of war, stating the names of the parties, British and foreign, to such agreements.

ANSWER.

These particulars are in the annexed schedules—"F".*

Question No. 8.

Details of the firm's present holdings of the capital of other firms, giving names (British and foreign), and of the holdings of the firm's capital by other firms, giving names (British and foreign).

ANSWER.

These details are shown in the annexed statements—"G"* and "H".*

Question No. 9.

The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war.

ANSWER.

A memorandum is attached in answer to this question.

In the event of your requiring any explanation of the accompanying documents or any further information, I shall be glad to arrange for a member of my staff, conversant with the details, to call on you.

I am, Sir,

Your obedient Servant,
(Sgd.) H. McGOWAN.

MEMORANDUM RE QUESTION No. 9.

The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war.

[Note.—The advertisements and brochures submitted have not been reproduced.]

ADVERTISEMENTS IN NEWSPAPERS AND SIMILAR MEDIA.

Dealing with the first part of this question the Board has never authorised any special appropriation for advertising military products which, generally speaking, only appear in advertisements indicating our general range of products. An example (marked "1") is attached.

There have, however, been occasional exceptional cases where we have been approached by certain Government organisations to advertise our products and, as an example, we attach a pull of one of our advertisements which has been appearing for the past two or three years in the *Revista Militar* (marked "2"). This review is sponsored by the military authorities in the Argentine.

We also attach ("3") a specimen of an advertisement for condenser tubes which has appeared from time to time in *Jane's Fighting Ships*.

Moreover, we were specially requested to insert a general advertisement in a Finnish newspaper during the British week which was celebrated in Helsingfors in the summer of 1933 and, in this, mention was made of our military products.

OUR OWN PUBLICATIONS.

Examples of the following are attached hereto for inspection:—

Naval and Military Explosives.

Published by Nobel Industries in 1923 and handed to Foreign Government officials on request. In some

* Not printed.

* Not printed.

5 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

cases our agents have distributed copies where we considered the recipients would be interested. The supply is now practically exhausted.

Cartridges for Military Rifles and Machine-guns.

First published in 1930, in three languages, it has been distributed rather more liberally along similar lines to those adopted in the case of the *Naval and Military Explosives* brochure.

In the *I.C.I. Products Book*, of which a copy is attached, naturally mention is made in the ordinary course, of military material as part of our general products.

Smoke-producing Devices and Baby Incendiary Bombs.

Distributed in a similar manner to those mentioned above.

Smoke Floats.

Published in collaboration with Messrs. Thornycrofts.

BRITISH EMPIRE EXHIBITION AND OTHER EXHIBITIONS AND FAIRS.

From time to time we have been represented at various exhibitions and fairs, a general range of products, including those of a military nature, having been shown. As an example we would mention particularly the British Empire Exhibition held in 1924 and 1925, when the two brochures attached were published. Special reference is made to military products on pages 47-50 in the larger brochure.

SHOWCASES.

A few showcases have been made and sent to our more important offices abroad and, in a few instances, have been presented to Foreign Government officials at their particular request.

SOLICITING OF ORDERS.

The method of sale we have adopted in foreign markets is by the appointment of agents who are paid by commission, although in one or two instances a retaining fee has been paid. We attach for the private information of the Commission a list* of these agents, giving the sterling value of the business done through each agency in each of the last five years and also a note of any retaining fees. From this list it will be seen that many of the agents have done no business whatever. The rates of commission vary, but the average paid on orders during the last five years has been 3-13 per cent.

The prices obtainable have generally been so low through competition that extravagant commissions, even if these had been thought of, were impossible. The average rate reveals that agents have had nothing to give away. In most countries nowadays any military requirement such as we supply is open to public tender, and even if agents could

afford it or favour the method there are but few opportunities for bribery and corruption. We are not going to claim that never has any of our agents passed on some of his commission. We do not know, nor do we approve or consent, but the average rate of commission paid proves that there is but little scope for irregularities. It must be remembered that not every country in its purchasing of supplies has the moral standard of Great Britain, but there is no question but that there has been a great tightening up in this respect, an altogether satisfactory development as far as we are concerned.

Our agents are chosen just as any agent would be chosen, viz., with respect to character and efficiency. In some instances our agents have some technical knowledge, but as regards practically every enquiry the technical details have to be discussed with our own experts. Indeed, a feature of the business in recent years has been the very onerous specifications that have been associated with enquiries. So onerous on occasions—we might say ridiculous—that we have refused to accept them. We likewise have refused to accept unreasonably long terms of credit. In other words, we will not allow our agents to take business except under tolerably reasonable conditions of specification, price and length of credit.

The business of our agents is to keep in touch with those who specify and contract for supplies, informing them of our ability to supply and seeking permission to tender as and when anything is required. Our agents are not permitted to suggest to any Government or its officials what they ought to require. Their business is to cater for requirements as and when Governments decide to order. When a Government suggests going in for manufacturing for itself we, as a rule, direct our agents to seeking orders for manufactured goods, because it is our business to supply these goods rather than to set up factories when there is already more than sufficient capacity existing.

Only as regards the supplying of military explosives have we a selling organisation superimposed on the agents. On the Continent of Europe, and it will be noticed from our list of agents that there are some countries in which we are not interested, agents are supervised by the Paris office of the du Pont Company, the agents as regards military explosives being in a position to offer the manufacture both of du Pont's and ourselves. In the Far East we have agents in common under the supervision of Mr. Montague-Smith, but as regards the Central Chinese Government all the orders are now placed through a Chinese Purchasing Commission located in Berlin. In South America there is supervision by Mr. N. E. Bates, his headquarters being du Pont, Wilmington. The office and travelling expenses of these supervising representatives are jointly borne by du Pont's and ourselves, but all sales, excepting those to the Chinese Purchasing Commission in Berlin, pass through the agents.

* Not printed.

APPENDIX 3.

STATEMENT SUBMITTED BY MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

(See Q.Q. 2771—2779).

I.C.I. SHIPMENTS TO BOLIVIA AND PARAGUAY (1928—1935), AND TO JAPAN AND CHINA (1931—1933), OF CERTAIN SUBSTANCES OF POTENTIAL USE IN THE MANUFACTURE OF WAR MATERIALS.

I.C.I. SHIPMENTS TO BOLIVIA (TONS).

	1928	1929	1930	1931	1932	1933	1934	1935
Sulphuric Acid	—	1	—	—	—	—	—	—
Chlorine	—	—	—	—	—	—	—	—
Ammonia Liquor	—	—	—	—	—	—	—	—
Anhydrous Ammonia	—	—	—	—	—	—	—	—
Sodium Nitrate	—	—	—	—	—	—	—	—
Nitric Acid	—	—	—	—	—	—	—	—
Ammonium Nitrate	—	—	—	—	—	—	—	—
Diphenylamine	—	—	—	—	—	—	—	—
Centralite	—	—	—	—	—	—	—	—
Ethylene Glycol	—	—	—	—	—	—	—	—
Dimethylaniline	—	—	—	—	—	—	—	—

I.C.I. SHIPMENTS TO PARAGUAY (TONS).

	1928	1929	1930	1931	1932	1933	1934	1935
Sulphuric Acid	—	—	—	—	—	—	—	—
Chlorine	—	—	—	—	—	—	—	—
Ammonia Liquor	—	—	—	—	—	—	—	—
Anhydrous Ammonia	—	—	4·8	1·4	—	—	—	—

Centralite	—	—	—	—	—	—	—	—
Ethylene Glycol	—	—	—	—	—	—	—	—
Dimethylaniline	—	—	—	—	—	—	—	—

I.C.I. SHIPMENTS TO JAPAN (TONS).

	1931	1932	1933
Sulphuric Acid	—	—	—
Chlorine	1	—	—
Ammonia Liquor	—	—	—
Anhydrous Ammonia	—	—	—
Sodium Nitrate	—	—	—
Nitric Acid	—	—	—
Ammonium Nitrate	369	800	900
Diphenylamine	—	—	—
Centralite	—	—	—
Ethylene Glycol	2	22	10
Dimethylaniline	—	—	—

Note.—Ammonium nitrate is sold to two makers of industrial explosives whose output has been steadily increasing. Ethylene glycol sales have been made to merchant firms for resale, possibly as an "anti-freeze".

I.C.I. SHIPMENTS TO CHINA (TONS).

	1931	1932	1933
Sulphuric Acid	—	95	88
Chlorine	7·35	4·99	0·29
Ammonia Liquor	—	3·04	4·04
Anhydrous Ammonia	40	14	12
Sodium Nitrate	—	—	—
Nitric Acid	—	—	2 gallons
Ammonium Nitrate	118	443	590
Diphenylamine	1·6	—	—
Centralite	—	—	—
Ethylene Glycol	—	—	—
Dimethylaniline	8	4	20

Note.—The sales of ammonium nitrate have been made exclusively to the South Manchurian Railway for the manufacture of industrial explosives.

Dimethylaniline is sold to certain small dyestuffs manufacturers for the production of Methyl Violet and similar dyes.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

SIXTEENTH DAY

Thursday, 6th February, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., LL.D., R.R.C.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

SIR HARRY DUNCAN MCGOWAN, K.B.E., Hon. D.C.L., Hon. LL.D.; Mr. HAROLD JOHN MITCHELL;
Mr. JOHN ROGERS, O.B.E., F.I.C.; Colonel EDMUND FRASER CRESWELL, D.S.O.; Mr. JAMES LAING;
Mr. LEONARD WILLIAM BICKFORD SMITH; Mr. CHARLES STANLEY ROBINSON, M.A., F.I.C., M.I.Chem.E.;
Mr. RALPH GILES HAWKINS; representing Messrs. IMPERIAL CHEMICAL INDUSTRIES LTD.;

called and further examined.

2994. *Sir Thomas Allen*: Sir Harry, in paragraph 10 of your statement,* you quoted two passages from the report of the Committee of Inquiry into the Royal Ordnance Factory, Woolwich, and submitted to the Minister of Munitions, Lord Inverforth, which you say appear to be particularly appropriate to the point that true comparisons between private enterprise and government factories are difficult to make. Have you that report by you?

Sir Harry McGowan: I am afraid not.

2995. *Sir Thomas Allen*: I wanted to correct what might be regarded as a wrong impression in respect to the quotations you made. We have it on record that Mr. Lloyd George, who was the first Minister of Munitions, did establish a costings system at the very beginning, which applied to all munition factories and also to Woolwich, and that in doing so a proper costing system was established, with the result, as was put to us in evidence, that it afforded a very useful check on the private manufacture, resulting in the reduction of costs. I have the report here to which you referred, and, to overcome the impression that there was no costings system at Woolwich, I would like to draw attention to it for a moment. That Committee was set up in March, 1918, I think, or in July, 1918, and reported in 1919. It says: "The Committee have directed their attention mainly to an examination of the costing system at present adopted at the Royal Ordnance Factories." I bring that out to show that a costing system was in existence. Then further down it says: "The cost accounting system at Woolwich was fully inquired into in 1902 by Mr. Morey, of Messrs. Price, Waterhouse & Co., chartered accountants, who examined the systems obtaining at certain private engineering establishments, and he stated that the system of cost accounting at Woolwich appears as well adapted to obtain the results required as that at any works he had visited. These results differ in character from those of commercial houses owing to

the absence of profit considerations and the requirements of parliamentary returns." I thought it proper that I should bring that out so that no impression might be left, arising out of the statements you quoted, that no costing system was in existence.

Sir Harry McGowan: We did not say that; we only quoted from the report submitted to Lord Inverforth.

2996. *Sir Thomas Allen*: That report also contains the statements which I have just read to you.

Sir Harry McGowan: Yes.

2997. *Sir Thomas Allen*: I think we ought to say that it is very gratifying to us to have the statement of your capacity to meet emergencies. I note, however, that Lord Mottistone, who, as Colonel Seely, was at one time Secretary of State for War, in a debate in the House of Lords on May 15th last said there was a terrifying inferiority in our capacity to adjust and expand our production for war needs; and Lord Hailsham, when he came to reply to the statement made, said he fully agreed that the danger point was our relative inferior power to expand production.—Can we take it from your statement that these observations do not apply as far as the I.C.I. is concerned?

Sir Harry McGowan: Yes, you may take it.

2998. *Sir Thomas Allen*: Under the present system the government is just a customer of yours, not a very large one. Would the loss of your United Kingdom and British Empire trade—representing only about 0.9 per cent. of your total trade—be a serious handicap to your general efficiency?

Sir Harry McGowan: No. I am not so much concerned with the profit we may lose by nationalisation as by the injury to the country.

2999. *Sir Thomas Allen*: It would be the greater loss which the nation would suffer?

Sir Harry McGowan: Surely.

3000. *Sir Thomas Allen*: Is your capacity to meet emergencies dependent in any measure upon the continuity of peace-time orders from the government?

Mr. Rogers: Certainly. It is very vital indeed, if any manufacturing concern is to expand

* *Minutes of Evidence*, 15th Day, p. 440.

6 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

when called upon, that it should have a nucleus from which to do so, and that nucleus must always have some manufacture going on all the time.

3001. *Sir Thomas Allen*: When you tell us that you are ready for an emergency, it is all dependent upon peace-time orders?

Mr. Rogers: Yes, entirely; except in so far as a process may be so well known and established that the mere keeping of plant in being is sufficient; but, generally speaking, the loss of technique with the workers and the other staff through having no orders to carry out destroys to a great extent their capacity to do what is wanted in an emergency.

3002. *Sir Thomas Allen*: Generally speaking, you are looking to peace-time orders to enable you to be efficient in time of war?

Mr. Rogers: Yes.

3003. *Sir Thomas Allen*: Now, apart from the question of profit arising out of the sale of munitions of war, it has been advanced to us—and I think, if I may say so, supported by the Peace Ballot which took place last year—that any interest in arms is not only the concern of the private manufacturer, or even the government, but is also the concern of every citizen, and every man who fights, and that on that ground a nation caring for its safety cannot afford to leave its destiny to the uncertain and uncontrolled operations of private firms. Is it your view that a dual system gives greater assurance of security than a national system could achieve, and, if so, would you suggest any strengthening or enlarging of national production in any direction?

Sir Harry McGowan: I think I have dealt with that in my remarks. I feel perfectly certain that the security of the country is ensured a hundred-fold by an association of private manufacturers with government factories; but I do think that the time has come to establish a supervisory body to co-ordinate still further these two units in national defence.

3004. *Sir Thomas Allen*: Perhaps I shall come back to that a little later.

Sir Harry McGowan: Very well.

3005. *Sir Thomas Allen*: You also say that under any modern conditions of war it would be impossible for any first-class nation to defend itself without an extensive, highly skilled and perfectly equipped chemical industry, such as is available in the I.C.I. I think we would all agree to that, but in this connection I should like to draw attention to what one witness said to us. He said that the manufacture of explosives, which is practically in the hands of the I.C.I., can easily be separated from the rest of the chemical industry and taken over by the government. Have you any views on that?

Mr. Rogers: Obviously the manufacture of explosives could be dealt with apart from any other chemicals, but not apart from the production of sulphuric acid and nitric acid. The point really is that you can easily establish an explosives factory—it is done. Holton Heath, the government factory, is one where they make such chemicals as are required for the manufacture of their explosives. That, of course, can be done, but, if I may say this, it is very unwise, if you can avoid it, to divorce even those chemical productions from other chemical productions.

3006. *Sir Thomas Allen*: That is what I wanted to get at. Frequent references have been made to the evidence of the Union of Democratic Control, but I notice that when they come to suggestions and proposals they appear not to be very arbitrary. Perhaps you can help us in that direction. The suggestions made by them were, in the main, three: firstly, that the manufacture of all industrial and military explosives should be nationalised; secondly, that the private manufacture of poison gas should be prohibited; and thirdly, that the export of raw materials likely to be used in the manufacture of explosives and poison gas should be made subject to licence. Have you any objections to those three proposals?

Chairman: You had better have them before you before you answer. Have you them?

Mr. Rogers: No.

3007. *Sir Thomas Allen*: I will read them again. First, have you any objection to the proposal that the manufacture of all industrial and military explosives should be nationalised?

Mr. Rogers: The manufacture of industrial and military explosives?

3008. *Sir Thomas Allen*: Yes.

Mr. Rogers: These reasons have been given by Sir Harry, but I am not at all in agreement with such a suggestion. To my mind, nationalisation to a certain extent for military purposes is quite debateable, but not the other. I see no point in it at all; I see no reason why that should be done, any more than you should nationalise the supply of steel drills for mines. Explosives are used in mines for the same purpose.

3009. *Sir Thomas Allen*: Second, have you any objection to the proposal that the private manufacture of poison gas should be prohibited?

Mr. Rogers: I know nothing about the private manufacture of poison gas.

Sir Harry McGowan: We do not do it.

3010. *Sir Thomas Allen*: You have no observations to make on that?

Mr. Rogers: No we know nothing at all about the private manufacture of poison gas.

3011. *Sir Thomas Allen*: Third, have you any objection to the proposal that the export of raw materials likely to be used in the manufacture of explosives and poison gas be made the subject of licence?

Mr. Rogers: That seems to me to be very curious; because if one takes substances that are used to make explosives they are substances which are in very common use for all sorts of purposes. Glycerine is very largely used by the tobacco industry; cotton, nitric acid, sulphuric acid. Chlorine—are you dealing with poison gas only?

Chairman: No.

Sir Thomas Allen: I am simply dealing with the question that they should be made subject to licence.

Chairman: Their recommendation was quite general.

Mr. Rogers: I cannot conceive that that would be very practicable in view of the fact that nearly all the substances used are used in even a very much wider sense in peace-time in ordinary industry.

3012. *Sir Thomas Allen*: You also advance the opinion that the proposal to nationalise all factories engaged in the production of munitions could only be carried out at tremendous cost and would be economically unsound. When you make that statement are you thinking in terms of starting new national industries from their foundation without any regard to existing facilities?

Mr. Rogers: My observations, if I may say so, had respect to both; either taking over or starting *de novo*.

3013. *Sir Thomas Allen*: It has been put to us that the scattered system now prevailing among firms in this country—scattered all over the country—is in itself uneconomic, and that a more centralised system would be very beneficial and would reduce cost.

Sir Harry McGowan: The scattering of factories might minimise the risk of bombing during war.

3014. *Sir Thomas Allen*: That is conceivable.

Mr. Rogers: As far as the I.C.I. factories are concerned, they are not spread about in the sense suggested. We have already attended to that matter of concentration in so far as we consider it advisable. Your observations may apply to other concerns with regard to which I am not familiar with the details, but not to the I.C.I.

3015. *Sir Thomas Allen*: It has been pointed out to us by one witness that it would be unreasonable

6 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

to single out a particular industry for the establishment of a monopoly. In that connection the witness reminded us, or rather, told us, that it was unscientific to talk of the arms industry as a whole; you must, he said, talk of ships as ships, heavy armaments as heavy armaments, aeroplanes as such, and chemicals as such, as really separate propositions. Would you agree with that?

Sir Harry McGowan: Separate from what point of view?

3016. *Sir Thomas Allen:* That each of these main implements of war should be treated as an entity.

Sir Harry McGowan: I am not prepared to advance an opinion on that, but I am prepared to say that the chemical industry should not be.

3017. *Chairman:* The point was that you might have to deal with each branch separately in the sense that you might apply a different remedy; one might be nationalised at one stage, and another might be nationalised at another stage, and so forth. I think that is what he was driving at, but your view is against nationalisation at any time?

Sir Harry McGowan: Undoubtedly.

3018. *Sir Thomas Allen:* Then you go on to say that it should not be assumed that executive and technical men who have been successful in commercial life would necessarily be willing to throw in their lot with a state monopoly. What I would like to ask you is this: Is it the inference that all executive and technical men engaged in private trade are actuated by the profit motive?

Sir Harry McGowan: No; I would not say that for a moment.

3019. *Sir Thomas Allen:* I ask you that question for this reason: I personally and, I think, the Commission as a whole, have been greatly impressed by the witnesses who have come here who were employed in private firms, the ones in high places, and government servants; they have impressed us with their ability, their general efficiency, their capacity to control a great industry, and I for one cannot but believe that they would equally have continued to serve the state if a state monopoly had been the government policy. That is my point.

Sir Harry McGowan: That is a question of opinion.

3020. *Sir Thomas Allen:* You also say that under a national system the incentive to national rivalry would tend to prejudice the maintenance of a high standard of efficiency. Nationally, you have removed or absorbed all rivalry—you would agree to that?

Sir Harry McGowan: What is that?

3021. *Sir Thomas Allen:* Nationally, you as the I.C.I. have removed or absorbed all rivals?

Sir Harry McGowan: No, no, no. We are not a monopoly; we have not embraced all the chemical manufacturers of the country, or anything like it.

3022. *Sir Thomas Allen:* That is your view, is it?

Sir Harry McGowan: It is a statement of fact; it is not a question of my view.

3023. *Sir Thomas Allen:* As far as you have gone you would claim that you are as efficient as ever, in fact more efficient than at any time of your existence?

Sir Harry McGowan: Yes.

3024. *Sir Thomas Allen:* And the further you go, if you could embrace the whole you would be more efficient still?

Sir Harry McGowan: I do not say that.

3025. *Sir Thomas Allen:* You do not think so?

Sir Harry McGowan: I do not say so.

3026. *Sir Thomas Allen:* My point was that if you go on absorbing you would naturally do so in the interests of efficiency.

Sir Harry McGowan: We might become unwieldy.

3027. *Sir Thomas Allen:* That is your point with regard to a national monopoly. I would like you, if you would, to elaborate a little further your answer to Sir Kenneth Lee yesterday when we were dealing with the question of the conscription of industry in time of war. Do you mean, in the statement you advance, anything more than this: that

the I.C.I. would be at the full disposal of the government during a time of emergency in respect to war supplies, but that for all other purposes it should be free?

Sir Harry McGowan: I would say at once that one must relate to the other, war supplies having priority.

3028. *Sir Thomas Allen:* War supplies would have priority?

Sir Harry McGowan: They must have priority.

3029. *Sir Thomas Allen:* We follow that.

Sir Harry McGowan: Then, of course, we must depend on the government to tell us to what extent we must make chemicals to keep certain vital industries going even during war.

3030. *Sir Thomas Allen:* I notice that you are not averse to some strengthening of the licensing system, and you do refer to the proposals made at Geneva by the Americans. How far are you in favour of those proposals?

Sir Harry McGowan: We are rather opposed to them now, on reflection. We think that foreign governments would object to a disclosure of the business we were doing with them, and I do not think it would help the cause of peace at all.

3031. *Sir Thomas Allen:* Speaking of the government as suppliers you contemplate that international complications would ensue that would embarrass the government. The government can say "Yes" or "No" under the licensing system, cannot it?

Sir Harry McGowan: Are you speaking of military explosives?

3032. *Sir Thomas Allen:* Yes. I am dealing with your statement. You say that you contemplate that international complications would ensue that would embarrass the government if it was the exporter.

Sir Harry McGowan: I think I referred more to chemicals generally in my remarks.

3033. *Sir Thomas Allen:* But do you contemplate the government being generally an international dealer in chemicals?

Sir Harry McGowan: I do not; I think it is quite impossible.

3034. *Sir Thomas Allen:* But do you contemplate it?

Sir Harry McGowan: Quite impossible.

3035. *Sir Thomas Allen:* My point is this: that if it is competent for the government now to deny any international supplies through a licensing system, where would the complications arise if it were the supplier itself?

Sir Harry McGowan: My remark applies to military explosives.

3036. *Sir Thomas Allen:* Yes.

Sir Harry McGowan: To propellants or ammunition. My remark was more of a general character if they nationalised the chemical industry, because then they would be competing with private manufacturers in other parts of the world, which would be intolerable.

Sir Thomas Allen: It does seem to me that the root of the munitions problem is that only highly industrialised countries can profitably manufacture appreciable quantities of arms. I am informed, for example, that 90 per cent. of the total world's exports are from ten producing countries, and that at Geneva no single objection was put up by any government against purchase from another government.

3037. *Professor Gutteridge:* Arising out of that last question put to you by Sir Thomas Allen, we were told at an earlier sitting of the Commission that the export of poison gas to Italy had been prohibited. Do you know anything about that?

Sir Harry McGowan: That is so.

3038. *Professor Gutteridge:* Why was it necessary to prohibit the export of poison gas if none is being made?

Sir Harry McGowan: We had not been doing it, but I have no doubt the government took the precaution of saying that it should not be exported.

3039. *Professor Gutteridge:* Do you know of any other firm making poison gas?

Sir Harry McGowan: Not to my knowledge.

6 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

3040. *Professor Gutteridge*: Do you think it was merely a precautionary measure?

Sir Harry McGowan: I think so.

3041. *Professor Gutteridge*: Are there any explosives used either in agriculture or for general commercial purposes which are also available at once in the military sense?

Mr. Rogers: Trinitrotoluol.

3042. *Professor Gutteridge*: Is that "T.N.T."? Excuse my ignorance on these matters.

Mr. J. Rogers: Yes. There are others, of course.

3043. *Professor Gutteridge*: Detonators serve a double purpose, too, do they not?

Mr. Rogers: Yes; but generally the war detonator is of a different type.

3044. *Professor Gutteridge*: You could not tell me this, I suppose: How does the French powder monopoly deal with a situation of that kind?

Mr. Rogers: I am afraid I could not tell you exactly.

3045. *Professor Gutteridge*: You do not know?

Mr. Rogers: No.

Mr. Smith: A situation of what kind?

3046. *Professor Gutteridge*: There is a monopoly, I understand, in military explosives and propellants in France; they are made in the government factories?

Mr. Smith: Yes.

3047. *Professor Gutteridge*: Do the French government run a dual system—that is to say, take T.N.T.—is that manufactured in a state factory and also in private factories, or how do they cope with that situation?

Mr. Smith: There is no T.N.T. manufactured in private factories; the state is the only manufacturer, and will supply anyone, of course.

3048. *Professor Gutteridge*: Are they, as a matter of fact, in the market in the commercial sense at all, do you know?

Mr. Smith: Direct to the consumer?

3049. *Professor Gutteridge*: Yes.

Mr. Smith: I really do not know. I think not as a rule.

3050. *Professor Gutteridge*: I think it was Sir Harry who told us that if you had national factories for military explosives and propellants there would necessarily be long periods during which those factories would have to stand idle. Could you go a little further into that? What reasons do you assign for that?

Sir Harry McGowan: I say that the peacetime requirements of various products for warlike purposes would not keep those factories occupied from January to December.

3051. *Professor Gutteridge*: You mean they would build up reserves quickly and then there would be nothing for them to do?

Sir Harry McGowan: Very likely.

3052. *Professor Gutteridge*: Would that mean that they would have to dismiss their hands?

Sir Harry McGowan: I think that is obvious unless they want them to stand doing nothing at all. 3053. *Professor Gutteridge*: I do not want to go over well-trodden ground, but I have a diagram in front of me, which you have no doubt seen, prepared by the Union of Democratic Control, which purports to show all the ramifications of your business; it is Fig. 2 (b).^{*} There is a circle in the middle and there are lines radiating in all directions. There are a very large number of different companies there. There is Bickford & Co., Austria, for instance—is that still in existence?

Sir Harry McGowan: Yes. They make safety fuses for mining purposes.

3054. *Professor Gutteridge*: Not military?

Sir Harry McGowan: No.

3055. *Professor Gutteridge*: I suppose you are interested in it?

Sir Harry McGowan: Yes.

3056. *Professor Gutteridge*: Cartoucherie Française?

Mr. Mitchell: We have a 23 per cent. interest.

3057. *Professor Gutteridge*: Cartoucherie Belge?

Mr. Mitchell: They have ceased to exist.

3058. *Professor Gutteridge*: Then they came out. Société Anonyme d'Arendonck?

Mr. Mitchell: We have an interest in that—it is an industrial explosives works—30 per cent.

3059. *Professor Gutteridge*: Then the Vise Company?

Mr. Mitchell: That is a small safety fuse factory in which we have a minority interest. They make safety fuses for the mines in Belgium. It has nothing to do with armaments.

3060. *Professor Gutteridge*: The Barbier group?

Mr. Mitchell: That is an industrial concern. No interest at all.

3061. *Professor Gutteridge*: I gather by its name that Comptoir Français de L'Azote deals in fertilisers?

Mr. Mitchell: Yes.

3062. *Professor Gutteridge*: Then the Poudreries Réunies?

Mr. Mitchell: We have no interest in them.

3063. *Professor Gutteridge*: No interest at all?

Mr. Mitchell: We have working arrangements.

3064. *Professor Gutteridge*: What do you mean by "working arrangements"?

Mr. Mitchell: Selling arrangements.

3065. *Professor Gutteridge*: Allocation of territory?

Mr. Mitchell: Allocation of customers in some cases.

3066. *Professor Gutteridge*: I do not want to go all round the circle, but I do not know whether someone could indicate which of these have ceased to be of importance.

Mr. Mitchell: General Motors Corporation—that is a motor-car concern. North American Chemical Company—

3067. *Professor Gutteridge*: When you say you have no interest you mean you have nothing whatever to do with them. May I take it generally that there are a great number of companies on this diagram with which you have nothing whatever to do? These diagrams have been very freely used, and therefore I want to know how far we can rely on them.

Mr. Mitchell: Might I supply the Commission with a note on the whole of these companies? Perhaps that would be simpler.

3068. *Professor Gutteridge*: Yes. It will save time.

Mr. Mitchell: We will give you a note of each one of these companies saying what our interest is, if any.*

3069. *Professor Gutteridge*: There are companies mentioned here which you do not deal with in your confidential statement.

Mr. Mitchell: You may take it that none of these companies touch the vital issue.

3070. *Professor Gutteridge*: You remember the form that your confidential statement took. When I come to look at this diagram there are companies here not mentioned on that list.

Mr. Mitchell: We will submit those to you later.

3071. *Professor Gutteridge*: That will save time.

Mr. Mitchell: The answer is that there are very few concerns in that with which we have any interest whatsoever.

3072. *Professor Gutteridge*: When you say "no interest" you mean you have no associations of any kind?

* Appended to Minutes of Evidence, 7th and 8th Days.

* See Appendix 1, p. 503.

6 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Mr. Mitchell: If we say no interest we mean that; but we have an indirect association with some of them.

3073. *Professor Gutteridge*: What do you mean by that?

Mr. Mitchell: It may mean they are in a cartel. The Belgian company that you mentioned is in a cartel in Belgium with a company in which we have a minority interest.

3074. *Professor Gutteridge*: You mean it is a very indirect association?

Mr. Mitchell: The d'Arendouck company is a company in which we have a small interest. It is in a cartel for the sale of explosives in Belgium. It does not sell outside Belgium. The Poudreries Réunies is also a member of a cartel; so that in that very indirect way we have an association with them, but we have no control at all over their activities.

3075. *Professor Gutteridge*: I suppose you would be willing to state the nature of your interest?

Mr. Mitchell: Yes. You have them in the chart which is before you in our confidential document.

3076. *Professor Gutteridge*: I do not think it covers all of them.

Mr. Mitchell: No; it does not cover these, I assure you.

3077. *Professor Gutteridge*: If necessary you would give us—

Mr. Mitchell: Any link of that kind.

Professor Gutteridge: Thank you.

3078. *Dame Rachel Crowley*: You would not object to that being annexed to our public proceedings?

Mr. Mitchell: Not at all.

3079. *Professor Gutteridge*: There is one name which has been mentioned in connection with you which does not appear here, but it does appear in the proceedings of the American Inquiry, and that is Bofors. Do they make chemicals?

Mr. Mitchell: Yes; and military explosives.

3080. *Professor Gutteridge*: Have you any interest in them?

Sir Harry McGowan: They are our chief competitors.

3081. *Professor Gutteridge*: That brings me to another point. I should like to know a little more on this question of competition. First of all, with regard to our own government, is there anyone else who supplies the government except you and the national factories?

Sir Harry McGowan: For what—for cordite?

3082. *Professor Gutteridge*: For military stores of any kind.

Sir Harry McGowan: I think that we alone of private manufacturers make cordite, but Greenwood & Batley and other firms made ammunition.

3083. *Professor Gutteridge*: You are the only firm?

Sir Harry McGowan: We are the only manufacturers of cordite, but there is another firm, Greenwood & Batley, who make military ammunition—that is, cartridges.

3084. *Professor Gutteridge*: They have to get the cordite from you?

Sir Harry McGowan: Or the government factories.

Mr. Rogers: There are other manufacturers of T.N.T.

3085. *Professor Gutteridge*: Are there many of them?

Mr. Rogers: One other at least.

3086. *Professor Gutteridge*: Is there any real competition between you and them for the supply of government requirements?

Mr. Rogers: Yes, definitely.

Mr. Laing: I do not know their prices; they do not know mine. We have real competition with one other manufacturer.

3087. *Sir Philip Gibbs*: Could we have the name of that other manufacturer?

Mr. Laing: Athole Allen of Stockton-on-Tees.

3088. *Professor Gutteridge*: There is real competition for, at all events, certain military requirements as between you and other British firms?

Mr. Laing: Yes, for most of them.

3089. *Professor Gutteridge*: Then it is incorrect to say that I.C.I. has a virtual monopoly so far as military stores supplied to our government are concerned?

Sir Harry McGowan: What do you mean by "monopoly"—as regards selling price or as regards output?

3090. *Professor Gutteridge*: I think that the meaning the witness attributed to it was that if the government wanted anything they had to go to you for it.

Sir Harry McGowan: That is correct for certain articles.

3091. *Professor Gutteridge*: No doubt there are certain things which you make and no one else makes.

Sir Harry McGowan: Yes.

3092. *Professor Gutteridge*: There are others as to which you are in competition?

Sir Harry McGowan: Yes.

3093. *Professor Gutteridge*: It all depends on the circumstances of the particular thing in question?

Sir Harry McGowan: Yes.

Mr. Rogers: It might help you if I mentioned something. There is a substance used by the government in propellant powders which happens to be made by us in our dyestuff works, which is also made by other people, and we regularly lose the contract and gain it again through competition.

3094. *Professor Gutteridge*: They get tired of you and go to someone else?

Mr. Rogers: No; they probably get a lower price from someone else.

3095. *Professor Gutteridge*: And then find that they cannot make it pay?

Mr. Rogers: We have sometimes to cut our price.

3096. *Professor Gutteridge*: Of course, you make small-arms ammunition?

Mr. Rogers: Yes.

3097. *Professor Gutteridge*: Is there any competition in that?

Mr. Rogers: Yes. I have just mentioned the name of Greenwood & Batley; they make ammunition.

3098. *Professor Gutteridge*: Small-arms ammunition?

Sir Harry McGowan: Yes.

3099. *Professor Gutteridge*: I want now to turn to your foreign trade. I am a little bit puzzled by this: You speak, I think, of intense competition; if that is so, I find it a little difficult to understand, in view of the fact that you and du Pont together must be a pretty formidable combine.

Sir Harry McGowan: Both of us are very competitive in all we do, and we have competitors in Bofors.

3100. *Professor Gutteridge*: With whom you have no connection?

Sir Harry McGowan: No; and then there are competitors in France.

3101. *Professor Gutteridge*: I am rather anxious to exclude competition by any company like that Czecho-slovak company in which you are shareholders.

Sir Harry McGowan: I would remind you that there are twenty small-arms manufacturers competing for business all over the world.

3102. *Professor Gutteridge*: Manufacturing cartridges, you mean?

Sir Harry McGowan: Yes.

3103. *Professor Gutteridge*: Twenty?

Sir Harry McGowan: Yes; so that there is plenty of competition.

3104. *Professor Gutteridge*: Does that apply to explosives, too?

6 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Mr. Laing: I could name five countries at the moment which are very strong competitors for any business which is going.

3105. *Professor Gutteridge:* Will you name them; because we want to get to the bottom of this.

Mr. Laing: Sweden, and Norway to some extent.

3106. *Professor Gutteridge:* Sprengstoff?

Mr. Laing: Yes. Poland; Belgium has been mentioned; France to a little extent; and Italy, before the present war—Italy very definitely.

3107. *Professor Gutteridge:* They are in active competition with you all the time, are they?

Sir Harry McGowan: Yes.

Mr. Laing: Yes.

3108. *Professor Gutteridge:* Do they cover the same range that you do, or are the same remarks applicable to them all—that there are certain things which can only be got from you?

Sir Harry McGowan: That is so.

3109. *Professor Gutteridge:* Is the world competition rather wider than the home competition in that sense?

Sir Harry McGowan: Yes, definitely.

3110. *Professor Gutteridge:* Are the Germans in the market at all?

Mr. Laing: Yes, now.

3111. *Professor Gutteridge:* I take it the result of that would be to intensify the competition?

Sir Harry McGowan: Yes.

3112. *Professor Gutteridge:* I want to ask you a few questions about licensing, which strikes me as a very important matter. First of all, I think I am right in saying—correct me if I am wrong—no licence is necessary for materials which could be converted either into military propellants or explosives, as the case may be?

Sir Harry McGowan: I understand not.

3113. *Professor Gutteridge:* That is quite clear, is it?

Sir Harry McGowan: I am so advised.

Mr. Laing: Yes, that is so.

3114. *Professor Gutteridge:* So far as you know, no attempt has been made during the present crisis to stop the export of any of those materials?

Sir Harry McGowan: Not so far as I know.

3115. *Professor Gutteridge:* What, in your opinion, would be the effect on your business of a requirement that these raw materials should require a licence for export?

Sir Harry McGowan: It is very difficult to estimate.

3116. *Professor Gutteridge:* Cannot you give me some idea?

Sir Harry McGowan: I am afraid I cannot.

3117. *Professor Gutteridge:* Would it be serious?

Sir Harry McGowan: It would need a good deal of investigation.

3118. *Professor Gutteridge:* Take chlorine, for instance.

Sir Harry McGowan: Would you suggest that chlorine should not be exported at all to any country that might be disposed to use it for poison gas?

3119. *Professor Gutteridge:* It has been suggested, but I do not suggest it. I am not here to make suggestions; I am here to receive them.

Sir Harry McGowan: If it is suggested, that would affect our export business very materially.

3120. *Professor Gutteridge:* I suppose you export very large quantities of chlorine?

Mr. Robinson: No; our export of chlorine is a small percentage of our total production for all purposes. If I might just help you, I will explain the connection of chlorine. I do not know much about poison gas myself, but in some of the evidence which has been read before this Commission allusion has been made to mustard gas. I understand also from the evidence given by the Union of Democratic Control—I did not know myself—which I have checked, that mustard gas is made from the raw materials chlorine, ethylene (which is obtained from alcohol) and sulphur. Those are the

essential raw materials. With regard to alcohol and sulphur, we do not deal with those raw materials. I suppose they can be obtained anywhere in the world, especially alcohol. With regard to chlorine, that is just one thing. Any country that desired to cover, as it should do, in defence its own requirements of, say, mustard gas, in an emergency can quite easily make its chlorine. The method they would employ would not be the method that we employ, which is based on industrial requirements where you must produce cheaply. But economics in war-time do not matter so much; it is simply that if you have a method you can employ it; and the alternative method which I have seen working in other countries is to take ordinary common salt pyrolusite and sulphuric acid, which are very widely distributed throughout the world; you bring those together and you make chlorine gas, and it is all you want to complete the chain of raw materials from which you can make mustard gas.

3121. *Professor Gutteridge:* I gather that the inference you are drawing from that is that even if you had a licensing system it would not be very much good, because mustard gas can be made anywhere?

Mr. Robinson: Yes. I would like to mention one other point. The assumption from the evidence which has been given is that it is a very easy matter once you have chlorine to make mustard gas. I do not think that was the experience of the British government during the War. I was rather young then and was not in contact with such matters, but I myself believe that if I were given the raw materials for making mustard gas I should, with my twenty years' experience of all kinds of chemical manufacture, have an extremely difficult job.

3122. *Dame Rachel Crowley:* The alternative method that you just mentioned, speaking as an ex-chemist, would be a very great waste of time and a very great waste of money, would it not? There would have to be very extraordinary circumstances if anyone bothered to apply your common salt method?

Mr. Robinson: I think not; because in Johannesburg—I know something about the gold-mining industry; I lived there—all the gold must be refined and separated from silver; you need chlorine for that, and you need several tons a year. A few hundred tons of chlorine, as has been said in this room, would go a very long way in the manufacture of mustard gas. They have made several hundreds of tons of chlorine by that method, and they find it economical and they find it cheaper for industrial purposes to make it that way than to cart chlorine from this country and to carry it up country about 400 miles. It is an economical method; otherwise the gold-mining industry in South Africa would not employ it. I suggest that is an answer to your question.

Dame Rachel Crowley: It is an answer to some extent, certainly.

3123. *Chairman:* You do not want very much, I suppose; if you want to make mustard gas it does not require very much chlorine in order to kill two or three hundred people.

Mr. Robinson: That has been stated at some length in the expert evidence given by the Union of Democratic Control. I think there is an estimate made there that a film of mustard gas over a certain area could quite possibly kill hundreds of thousands of people. This requires very few tons of mustard gas, and a still smaller quantity of chlorine.

3124. *Professor Gutteridge:* You export T.N.T., do you not?

Sir Harry McGowan: Yes.

3125. *Professor Gutteridge:* What would be the effect on requirements, with all your experience, if the exports of T.N.T. were licensed?

Mr. Laing: They are just now—military material.

6 February, 1936.]

MESSRS. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

3126. *Professor Gutteridge*: Have you found that that hampers your trade in T.N.T.?

Mr. Laing: No. We do not object to licensing. I do not think we would say that it hampers us; we believe in it.

3127. *Professor Gutteridge*: It has been suggested that when you receive orders for these things you should have to obtain permission before you accept the orders. Would you object to that?

Mr. Laing: No.

3128. *Professor Gutteridge*: You do not accept the order until you know whether the government will let you export?

Mr. Laing: That is so.

3129. *Professor Gutteridge*: Another suggestion has been made—I expect you are familiar with it—and that is this: that all orders received for ammunition from abroad should be made public. What would the effect of that be on your business? Supposing you got an order for T.N.T. for "Ruritania"?

Sir Harry McGowan: It think it would be a little unfair to us; we would be disclosing to competitors in our business what we were doing; and I think it would be unfair to the purchaser too.

3130. *Professor Gutteridge*: When you say "unfair to the purchaser" you mean that it would enable other people to know what he is doing—is that what you mean?

Sir Harry McGowan: Yes.

3131. *Professor Gutteridge*: As a matter of fact, I think it was our chairman who made this suggestion—that the remedy in this case may be worse than the evil; that if you let A know what B is buying, that will encourage A to go and buy more.

Sir Harry McGowan: Yes.

3132. *Professor Gutteridge*: We have had a number of proposals put before us: one was that all munitions exported from this country should be purchased through a government agency or board—that is to say, instead of going direct to the producer in Great Britain the foreign importer should have first to go through a board, and he would have for that purpose to put his orders through that board. Have you considered that question?

Sir Harry McGowan: I see no advantage in that at all.

3133. *Professor Gutteridge*: You do not think that any benefit would result from it?

Sir Harry McGowan: No. What would the board do?

3134. *Professor Gutteridge*: You must not ask me questions; but, of course, what is suggested is that the board would act as a kind of filter and prevent certain things which are complained of.

Sir Harry McGowan: We think that can be done effectively now by the form of licensing.

3135. *Professor Gutteridge*: In fact you are in favour of the system of licensing, and possibly a stiffening up a bit. What is your procedure when you ship ammunition abroad; you first of all get your licence?

Mr. Hawkins: Yes.

3136. *Professor Gutteridge*: I do not want to trouble about the actual getting of the licence; but when you have it, is there anyone here who can tell me what the office does with it—I think it is important.

Mr. Hawkins: The licence is handed to the customs officer when the shipment is made.

3137. *Professor Gutteridge*: That is not quite what I wanted to know. You first of all pack your goods?

Mr. Hawkins: Yes.

3138. *Professor Gutteridge*: Do you put anything on them which shows what they are?

Mr. Hawkins: Yes. We are bound by the Explosives Act to state what the contents are, and also the shipping marks.

3139. *Professor Gutteridge*: You are in rather a special position as regards that matter—you have to label the goods?

Mr. Hawkins: Yes.

3140. *Professor Gutteridge*: Otherwise you are liable to a very heavy fine?

Mr. Hawkins: Yes.

3141. *Professor Gutteridge*: So that it would be very difficult in your case to evade it; you would run a very big risk in endeavouring to evade it?

Sir Harry McGowan: Impossible.

3142. *Professor Gutteridge*: Therefore, possibly in your case the licensing regulations are more effective than they might be in the case of machine guns, which can be packed up as pianos or perambulators?

Sir Harry McGowan: Yes.

Mr. Mitchell: All these goods have to pass through various hands—shipping hands, customs, and other people. Every one of those individuals requires to see the licence and requires to see that the package is properly marked in accordance with the Explosives Act, and the ship will not take the stuff unless the stuff itself is properly marked and licensed.

3143. *Professor Gutteridge*: I know from my own experience during the War that when shipping explosives you took every possible precaution to see that every possible requirement was observed.

Mr. Mitchell: One is compelled to.

3144. *Professor Gutteridge*: I think we have covered the ground pretty thoroughly. Is there anything else that you would like to say?

Sir Harry McGowan: I think not. We have covered the ground, I think, very exhaustively, and I hope we have given you all the information you wanted.

Professor Gutteridge: I think you have helped me, as far as I am concerned.

Chairman: Yes. I think we may fairly say you have given us all the information we have asked for, and I think that is all.

3145. *Sir Philip Gibbs*: I understood from you definitely yesterday that you do not make poison gas at all. Did I also understand that you have no research into poison gas?

Mr. Rogers: Yes, that is so.

3146. *Sir Philip Gibbs*: Have you no research laboratory engaged in investigating the latest poison gases?

Mr. Rogers: No.

3147. *Sir Philip Gibbs*: And therefore you are not dealing at all at the moment with any deterrents against poison gas?

Mr. Rogers: No, I rather think we are not. I am not quite certain of that. For instance, if we are asked about an antidote or a corrective to mustard gas we should say bleaching powder. If the government asked us to do anything about bleaching powder for such a purpose we would do it; but I am not aware of anything of any importance that we are doing at the moment even in that direction.

3148. *Sir Philip Gibbs*: Are you aware at all of foreign poison gases?

Mr. Rogers: I personally have no knowledge. We know practically nothing about poison gases; we are not interested.

3149. *Sir Philip Gibbs*: Can you tell me definitely that your research department is not interested in that?

Mr. Rogers: Yes.

3150. *Dame Rachel Crowdy*: What would be the effect on the I.C.I. as you see it if the export of lethal substances and lethal weapons were abolished altogether?

Sir Harry McGowan: In the form of raw materials?

3151. *Dame Rachel Crowdy*: Yes; and lethal substances and weapons.

Sir Harry McGowan: I can only repeat what I said a few minutes ago—I think it is a question of calculation, and I cannot answer off-hand.

3152. *Dame Rachel Crowdy*: Would you be able to work out something like that?

Sir Harry McGowan: I think we could.

3153. *Dame Rachel Crowdy*: When I speak of lethal weapons I am thinking of things which I must not pronounce—baby bombers, and so on. Would you let the Commission have something of that kind?

6 February, 1936.]

Messrs. IMPERIAL CHEMICAL INDUSTRIES, LTD.

[Continued.]

Sir Harry McGowan: Yes.*

3154. *Dame Rachel Crowdy:* *A propos* of the question raised both by Professor Gutteridge and Sir Thomas Allen, I gather you have decided that you would be against any international disclosure of licences?

Sir Harry McGowan: Yes.

3155. *Dame Rachel Crowdy:* Do not you think there might be a good deal of value in having the power of comparison?

Sir Harry McGowan: I am afraid not.

3156. *Dame Rachel Crowdy:* I know that you personally dislike it when there is any comparison made between the arms traffic and the drugs traffic, but, of course, both have a legal use and both have unfortunately been used illegally, so that there is some comparison. I remember in Geneva, when we finally got an international agreement that an international licensing system should be established and that importers' certificates should be disclosed, the amounts they covered were different. The very first case I remember was the case of the export of a particularly dangerous drug which we were trying to control, where country *x* said they had exported 1,100 kilos, to country *y*; country *y* in its turn said that it had imported only one kilo. I think you would get exactly the same thing arising if you could have a comparison of the export and import of arms.

Sir Harry McGowan: With all deference, I doubt it. I think it might produce a greater demand for military compounds on the part of those countries seeing that every possible potential aggressors were laying in greater stocks than they were.

3157. *Dame Rachel Crowdy:* It is a case of Japan getting too much and China must have more?

Sir Harry McGowan: Yes.

3158. *Dame Rachel Crowdy:* It was brought out yesterday that the plant and raw materials of your enterprise would be immediately available in the event of war.

Sir Harry McGowan: Yes.

3159. *Dame Rachel Crowdy:* If that is the case, can the loss of something which is well under 2 per cent. of your trade, the military side, be quite as important as is implied to the country, if 98 per cent. of your whole output is available for expansion in war-time.

* See Appendix 2, p. 506.

(The witnesses withdrew.)

Mr. H. A. REINEKE, chairman and managing-director, and Mr. D. M. CAMERON, secretary, Messrs. WILLIAM BEARDMORE & Co., Ltd., called and examined.

3166. *Chairman:* Are you representing Messrs. William Beardmore & Co., Ltd.?

Mr. Reineke: That is so.

3167. *Chairman:* What is your name, please?

Mr. Reineke: Reineke.

3168. *Chairman:* Are you chairman of the voting control committee of William Beardmore & Co., Ltd., and chairman and managing director of the company since 1930?

Mr. Reineke: That is right.

3169. *Chairman:* I understand that you are yourself the British-born son of a naturalised British father of German origin and of a British-born mother, and that two of your brothers served as officers in the British Army during the War?

Mr. Reineke: That is quite true.

3170. *Chairman:* You have submitted a detailed statement in answer to our questionnaire, and our questionnaire was in this case, the same as was addressed to Messrs. Vickers and to the L.C.I.† If it is convenient to you I would wish that your statement should be read.

† See Minutes of Evidence, 15th Day, Appendix 2.

Sir Harry McGowan: I think I made our position clear when I said that the question of the profit we make on our present production of war-like supplies does not give us any concern at all. It is a question of keeping the personnel trained in our factories equipped to take care of an emergency when it does come.

3160. *Dame Rachel Crowdy:* The point you made yesterday was that your ordinary commercial plant, your chemicals being what they are—your ordinary commercial power and your ordinary commercial raw materials were very easily and would be very easily, in as efficient an organisation as yours, convertible to war use.

Sir Harry McGowan: To a very large extent. 3161. *Dame Rachel Crowdy:* Is the under 2 per cent. quite as important to the country as you think it is, if the other 98 per cent. can be easily converted?

Mr. Rogers: May I deal with that aspect of it? Let us assume—as it is the fact—that we employ in the manufacture of explosives and munitions (say) a number of people, a figure of the order of 700. In a very short time that would be diluted to perhaps 7,000, going right through. It is therein that the importance of keeping military business in being exists.

3162. *Dame Rachel Crowdy:* Specifically trained man power?

Mr. Rogers: Yes—a nucleus from which to dilute. If we had no business of that kind the multiplication of 0 by 7,000 would not mean anything.

3163. *Chairman:* In order to avoid any misunderstanding about this publication of orders, I can quite understand the objection to the publication of orders or licences so long as one country is acting unilaterally, but assuming the time comes (which one trusts it may) when there is an agreement about limitation of armaments,—directly that is agreed, then publication of orders becomes very important and very necessary?

Sir Harry McGowan: I agree.

3164. *Chairman:* As a check?

Sir Harry McGowan: I agree.

3165. *Chairman:* That is all. We are much obliged to you. I would like to say that I think you have given us all the information that we can reasonably require, and have given it in full.

Sir Harry McGowan: Thank you so much, and thank you for your courtesy.

The following letter and enclosure were read:—

William Beardmore & Co., Limited.

Parkhead Steel Works, Glasgow.

London Office,

36, Victoria Street, S.W.1.

26th September, 1935.

Edward Twentyman, Esq.,

8, Buckingham Gate,

London, S.W.1.

SIR,

Referring to the letter which you addressed to me on the 24th April, I now have pleasure in sending you the information required in reply to your nine questions.

You will remember that when I called upon you on the 16th July I explained to you that certain establishments belonging to the Company have been closed down during the last five years, which, prior to their closing, were engaged upon the manufacture of "Arms and Munitions of War."

6 February, 1936.]

MESSRS. WILLIAM BEARDMORE AND CO., LTD.

[Continued.]

I was referring, as I explained, to the Shipyard and Marine Engineering Works at Dalmuir, where warships had previously been built.

The shipyard having been sold, and the building of marine engines having been abandoned, I have felt that to include figures relating to Dalmuir in those which are being supplied in reply to your questionnaire would not help the Royal Commission in arriving at its conclusions, but would, indeed, obscure the picture with regard to the Parkhead Steel Works, that being the only establishment belonging to the Company which would come into question in the event of the establishment of a State monopoly.

If, nevertheless, the Royal Commission should desire to have particulars concerning the Dalmuir establishments, I shall be glad to know their wishes and to meet them to the best of my ability.

The particulars now furnished in reply to your questions apply only to the Parkhead Steel Works. The answers to Questions 1 and 2 are set out in enclosure No. 1.

The estimated replacement value of plant which would be rendered redundant in the event of the establishment of a State monopoly is as follows:—

Plant employed only on armament work	1,120,000
Plant necessitated by armament work but also employed on commercial work... ..	1,150,000
Totally redundant	2,270,000

Enclosure No. 2 contains the information required in reply to Question No. 4. The published results, of course, include Dalmuir and other figures, but the proportion attributable to armament work at Parkhead is shown separately.

Enclosure No. 3 contains the reply to Question No. 5, regarding the number of men employed on armament work.

Question No. 6 will be dealt with at a later stage in this letter.

Enclosure No. 4* sets out the various agreements and arrangements between the Company and other companies engaged upon armament work.

In reply to Question No. 8, I enclose (Enclosure No. 5*) a list of the Company's holdings in other companies.

Short of sending you a copy of the register of shareholders, which I shall, of course, be glad to make available to you should you so desire, I find it difficult to answer your further question regarding holdings of the Company's capital by other firms.

No armament firm has any holding enabling it or entitling it to exercise any influence on the Company's policy, or to exercise any rights beyond those of any other shareholder. You will, no doubt, tell me so if in thus answering your question I have not correctly interpreted it.

In answer to Question No. 9, you will have gathered from my answer to Question No. 2 that H.M. Government is practically our only customer for armaments. In these circumstances, we have no special organisation for advertising these products or for soliciting orders in other quarters, although, of course, our ordinary trade advertisements contain references to the fact that armour, ordnance, etc., are manufactured at Parkhead.

As will be gathered from these answers to your questions, a considerable amount of work has been involved in preparing the information required. The questions have not presented a real difficulty excepting in the case of Question No. 6, in which you ask: "What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war?"

[Passage in reply to Question 6 not printed.]

* Not printed.

In conclusion, I should mention that the subsidiary companies of William Beardmore & Company are enumerated in the answer to Question No. 8. Not one of these companies is an armaments firm in any sense of the word, although one or the other amongst them may execute occasional orders for material used in the manufacture of munitions or in warship construction.

The only instance of this, of which I have definite knowledge, is afforded by the firm of John Broadfoot & Co., Limited, who supply brass castings to shipbuilders, including warship builders. I have assumed that for the purpose of your inquiries you would wish companies to be ignored which are only so remotely and intermittently engaged upon munitions work of an indirect nature.

With reference to the two concluding paragraphs of your letter, I will gladly furnish you to the best of my ability with replies to any further questions which the Royal Commission may wish to address to me.

I am, Sir,

Your obedient Servant,

(Sgd.) H. A. REINCKE,
Chairman.

Enclosure No. 1.

Total turnover for each of the five years ended 31st December, 1934, showing proportion attributable to production of munitions of war:—

Year.	Total turnover		Proportion attributable to munitions.	
	£	Per cent.	£	Per cent.
1930	643,167	100	112,047	17
1931	417,567	100	131,985	32
1932	265,853	100	89,366	34
1933	442,198	100	280,954	64
1934	542,646	100	216,490	40

Proportion of turnover in each of the five years ended 31st December, 1934, attributable to:

- (a) United Kingdom:
- (b) British Empire: and
- (c) Foreign, orders:—

Year.	United Kingdom.		British Empire.	
	£	Per cent.	£	Per cent.
1930	102,642	16	6,890	1
1931	131,985	32	Nil	—
1932	85,166	32	Nil	—
1933	280,954	64	Nil	—
1934	216,340	40	Nil	—

Year.	Foreign.		Total.	
	£	Per cent.	£	Per cent.
1930	12,515	—	112,047	17
1931	Nil	—	131,985	32
1932	14,200	2	89,366	34
1933	Nil	—	280,954	64
1934	150	—	216,490	40

† Material for Boiler Equipment.

Enclosure No. 2.

Declared results for whole Company after providing for interest on Loans and Dehenture Stock, losses in Departments closed down, etc., but with no provision for depreciation (all as per published accounts of the Company, prints of which for each of the five years to 31st December, 1934, are attached*):—

1930	Loss £250,054
1931	Loss £159,508
1932	Loss £177,501
1933	Loss £164,024
1934	Loss £64,810

Estimate of the proportion of the above results attributable to the production of arms and munitions

* Not printed.

6 February, 1936.]

MESSRS. WILLIAM BEARDMORE AND CO., LTD.

[Continued.]

of war, being the proportion of trading results of Parkhead Steel Works excluding any of the following items:

1. Interest on Loans and Debenture Stock;
2. Losses on Departments closed down;
3. Losses on Subsidiary Companies;
4. Income received from Property and Investments;

but with no provision for depreciation of buildings and plant:—

1930	Loss	£12,447
1931	Loss	£ 5,894
1932	Loss	£14,327
1933	Profit	£47,904
1934	Profit	£52,383

3171. *Chairman:* You state that your only customer is the government.

Mr. Reincke: For armaments.

3172. *Chairman:* You do make other materials?

Mr. Reincke: Yes.

3173. *Chairman:* That accounts for the last answer, in which you state, for instance, in the last year you had 1,206 employees, 592 engaged on armament work. On what kind of work were the rest of the people engaged?

Mr. Reincke: Heavy forgings, castings, railway material and so on—all steelwork.

3174. *Chairman:* You have dealt with your agreements in the same way as the other firms have dealt with theirs, and you have put them into a schedule which you ask may be treated as confidential.

Mr. Reincke: That is so.

3175. *Chairman:* With one exception all the agreements that you refer to in that schedule are agreements made with British firms under this rationalising system; is not that so?

Mr. Reincke: That is so.

3176. *Chairman:* They have all been mentioned. I do not know whether you have seen Vickers' evidence?

Mr. Reincke: Yes.

3177. *Chairman:* I mentioned them in the questions I put to Sir Herbert Lawrence. These are the same agreements, are they?

Mr. Reincke: Exactly.

3178. *Chairman:* There are only two additions about which I want to ask a question. One of these rationalising agreements appears to have a foreign branch; it is under the Forgemasters' Convention, which is one of the British rationalising agreements. You say there is a continental group. The English branch of the Convention is described as follows:—

"Limits imports of forgings over two tons in weight to agreed quotas for shipbuilding and general requirements; also limits exports of similar forgings to neutral continental countries in an agreed quota. Excludes all forgings for British Admiralty work."

Do these particulars cover the continental branch as well as the English branch?

Mr. Reincke: Yes.

3179. *Chairman:* It is merely that a certain number of foreign firms have come into this Forgemasters' Convention?

Mr. Reincke: For the purpose of regulating matters pertaining to the foreign forgemasters as well as to ourselves.

3180. *Chairman:* It has the same object; it is for regulating prices?

Mr. Reincke: Yes, for quoting.

3181. *Chairman:* And really for eliminating competitive tendering, to a certain extent?

Mr. Reincke: It assists in making the protective system effective.

3182. *Chairman:* We have already been told, I think, that the three English firms, the English Steel Corporation, and Firths and Brown's, and Beardmore's, are now all in agreement with regard to the manufacture of armour plate.

Enclosure No. 3.

Average number of employees at Parkhead Steel Works for each of the five years ended 31st December, 1934, and estimated proportion employed on production of munitions of war:—

Year.	Total number of employees	Number engaged on munitions of war
1930	1,081	433
1931	1,018	434
1932	792	314
1933	1,034	495
1934	1,206	592

Mr. Reincke: Yes.

3183. *Chairman:* There is no competitive tendering about that any longer. Are you prepared to allow the government the fullest possible opportunity of checking the prices?

Mr. Reincke: Absolutely. And they take advantage of it too; they do it constantly.

3184. *Chairman:* What in fact do they do? Have you a system of costings?

Mr. Reincke: Yes.

3185. *Chairman:* And they come and examine them, do they?

Mr. Reincke: Yes.

3186. *Chairman:* By skilled accountants?

Mr. Reincke: Yes.

3187. *Chairman:* And you put no obstacle in their way in checking?

Mr. Reincke: Absolutely none.

3188. *Chairman:* The prices are agreed after their representative has come and checked your figures?

Mr. Reincke: Yes.

3189. *Sir Kenneth Lee:* Is there an agreed amount for overheads to start with in the price arrangement?

Mr. Reincke: That is awfully difficult to answer, because in so far as the price has to be agreed, of course the constituent parts of the price are agreed.

3190. *Sir Kenneth Lee:* Yes, but does each of the three manufacturers get the same basis?

Mr. Reincke: The answer is yes, definitely.

3191. *Sir Kenneth Lee:* Is that a percentage on the total cost?

Mr. Cameron: There is no agreed figure for the percentage of on-cost. It is made up. It may be agreed by them.

3192. *Sir Kenneth Lee:* So you are not sure that they allow you the same as the English Steel Corporation?

Mr. Reincke: We cannot answer as to what may be the composition of the final price with regard to the other firms. The Admiralty have access to the details of other firms which we have not.

3193. *Sir Kenneth Lee:* I understand there is no competition?

Mr. Reincke: There is no competition.

3194. *Sir Kenneth Lee:* The prices are all the same?

Mr. Reincke: Yes.

3195. *Sir Kenneth Lee:* And they examine the cost?

Mr. Reincke: Yes.

3196. *Sir Kenneth Lee:* I am not quite clear how this is arrived at.

Mr. Reincke: I am not an expert accountant. All I know is that expert accountants from the Admiralty come down and spend days on our books and the result is that the make-up of the price is formulated by the Admiralty, and when they have that the Admiralty fix the price in consultation with us.

3197. *Sir Kenneth Lee:* You get the order and the price is fixed later; is that it?

Mr. Reincke: Very often that is the case in practice.

3198. *Sir Kenneth Lee:* The price is settled after inspection of the books?

6 February, 1936.]

MESSRS. WILLIAM BEARDMORE AND CO., LTD.

[Continued.]

Mr. Reincke: It may be so. The Admiralty may be content for a price to be put in with their knowledge, but the Admiralty absolutely have the right, and they exercise it, to come and examine our books when they want to do so.

3199. *Chairman:* May I ask a question about that? I do not quite understand it. Supposing the Admiralty want something that you manufacture, and that is also manufactured by the other two firms who are concerned in this particular business, do they ask each one of you for a price before they begin?

Mr. Reincke: They may.

3200. *Chairman:* How is it started?

Mr. Reincke: It depends on the circumstances and what it is.

3201. *Chairman:* Did Woolwich make this particular class of armament work that you have undertaken?

Mr. Reincke: Some of it. They do not make armour plate.

3202. *Chairman:* Do you ever come into competition with Woolwich?

Mr. Reincke: I should say yes.

3203. *Chairman:* We have been told that the way in which the director of contracts deals with Woolwich and the private firms is this. He may have a certain amount of work to distribute, he distributes some to Woolwich to keep them going, and some to private firms to keep them going, and then there is a margin which he puts up to competition. Have you ever been in competition with Woolwich for an order?

Mr. Reincke: In this sense: if our prices are too high, compared with the prices at which Woolwich make a particular thing, presumably we would not get the order.

3204. *Chairman:* But have there been any cases in which you have been tendering against Woolwich and you have obtained orders because your price was lower than that of Woolwich?

Mr. Reincke: Not that I know. I would not know if that circumstance arose, I think.

3205. *Chairman:* You would not know whether you were in fact in competition with Woolwich?

Mr. Reincke: No. I might well be in competition without knowing it.

3206. *Sir Philip Gibbs:* Has the government any effective control over the prices? Although they see your costings and so on, have they not to accept the price based on those costings because they have no control at all over the cost of the material?

Mr. Reincke: Of course, if they cannot control the price of the material they cannot control the price; nor can we. We would put the price of the material at what it was.

3207. *Sir Philip Gibbs:* Therefore, the government is actually in the hands of what might be called the steel ring?

Mr. Reincke: Oh, no. I have not said anything which implies that.

3208. *Sir Philip Gibbs:* I do not see how the government could act. Supposing, for instance, they thought these things were getting rather expensive, I do not see how they could avoid that expense.

Chairman: They could buy from abroad, I suppose?

Mr. Reincke: I cannot see the government buying armaments abroad.

3209. *Chairman:* No, but Sir Philip was speaking about the components of armaments, the raw materials.

(The witnesses withdrew.)

Mr. Reincke: We cannot control the price of raw materials any more than the government can.

3210. *Sir Philip Gibbs:* Therefore, the actual fact is that although they know all about the costings and so on and the overhead charges, they cannot lower prices.

Mr. Reincke: The point is, they control the price which we can charge them.

Sir Philip Gibbs: Not as far as material enters into it.

3211. *Chairman:* Both you and the government start with the price at which you can get the raw material?

Mr. Reincke: Yes.

3212. *Chairman:* And then they correlate the price which you are charging for your work and your raw materials.

Mr. Reincke: My difficulty in answering you, Sir Philip, is this—that the answer is so obvious that I must imagine there is something at the back of your mind that I have not seen.

Sir Philip Gibbs: There is nothing sinister at the back of my mind.

3213. *Professor Gutteridge:* I think your company is controlled by the Law Debenture Corporation, is it not?

Mr. Reincke: No, the Law Debenture Corporation are the trustees for the debenture holders.

3214. *Professor Gutteridge:* It has been suggested—I do not know why it should be—that there is something sinister in that. Perhaps you would explain how it came about?

Mr. Reincke: There is always something sinister about armaments firms.

3215. *Professor Gutteridge:* Perhaps you would explain how this particular incident arose?

Mr. Reincke: Why is it sinister?

3216. *Professor Gutteridge:* I am not saying it is sinister. I am saying that some people seem to think it is. That is why I was asking you whether you would explain it.

Mr. Reincke: The company was practically bankrupt in 1928 and on the reconstruction new money was made available to the company on certain conditions, and the properties of the company were mortgaged, of course, to the debenture holders, and the Law Debenture Corporation were appointed as trustees. That is all.

3217. *Professor Gutteridge:* Would you be prepared to give us any particulars confidentially?

Mr. Reincke: About the trust deeds, certainly.

3218. *Professor Gutteridge:* Perhaps you would not be prepared to give them in public?

Mr. Reincke: I have not the document here.

Mr. Cameron: The trust deeds are available to the public.

3219. *Professor Gutteridge:* They can be seen at Somerset House?

Mr. Cameron: Yes.

3220. *Professor Gutteridge:* There is no mystery about it at all?

Mr. Reincke: No mystery at all.

3221. *Professor Gutteridge:* Then I may take it that when one sees these pictures of armament manufacturers creeping about with moneybags in their hands, it does not apply to you!

Mr. Reincke: I should be very pleased to have the photographer there when I had the moneybags.

3222. *Professor Gutteridge:* You have been carrying on business at a very heavy loss for some years?

Mr. Reincke: Yes.

Chairman: We are very much obliged to you.

Major A. B. H. CLERKE, C.B.E., managing director, Messrs. Hadfields, Limited, called and examined.

3223. *Chairman:* I think, Major Clerke, you are here representing Messrs. Hadfields, Ltd.?

Major Clerke: I am, Sir.

3224. *Chairman:* It is usual to give some information with reference to the position of the person who

represents the company. I have here particulars concerning yourself. You are a C.B.E., late R.F.A. You were educated at the Royal Military Academy, Woolwich. You were assistant inspector of steel, 1899; instructor, Ordnance College, 1904; chief

6 February, 1936.]

Messrs. HADFIELDS, LTD.

[Continued.]

instructor, 1906; commanded 19th Battery, R.F.A., India, 1907; inspector, Royal Arsenal, 1908. That would be Woolwich, would it not?

Major Clerke: Yes.

3225. *Chairman:* Retired 1911, and director, Messrs. Hadfields, 1913. On the formation of the Ministry of Munitions in 1915, at which time you were director in charge of munitions work at Messrs. Hadfields, you returned to Woolwich as a volunteer for a month to organise the department of munitions inspection. At the end of that time you established them in headquarters at Sheffield, where you were able to supervise them generally until they were firmly established. You provided them with a model inspection bond in your works, which also served as a training school for examiners. That is an instance of where a private firm assisted the Ministry of Munitions. That is an example?

Major Clerke: That was the idea.

3226. *Chairman:* You have followed the same course as the other firms have done, you have answered our questionnaire and you have inserted a private schedule which includes your answer to Question 6, and also makes the same claim with regard to certain documents. I had better deal with the documents straightaway before we read the answers. They are in substance, are they not, a list of the agreements which have been entered into by British firms under this rationalising agreement?

Major Clerke: Yes, Sir.

3227. *Chairman:* The Forgemasters Convention. There is a continental group. I asked the last witness about that. With that exception they are all agreements, are they not, between British firms? I think I am right in saying that?

Major Clerke: Yes, I think it is right. There is the Nickel Syndicate.

3228. *Chairman:* We know all about that. With that exception they are merely these rationalising agreements between British firms?

Major Clerke: Yes, broadly. Some were in existence before that. They are all on the same lines.

3229. *Chairman:* With regard to your statement, would you like to read it yourself or have it read for you?

Major Clerke: May I trespass on the kindness of the secretary?

The following letter was read:—

East Hecla Works,
Sheffield.

16th October, 1935.

Edward Twentyman, Esq.,
Secretary, Royal Commission on the
Private Manufacture of and
Trading in Arms,

8, Buckingham Gate, London, S.W.1.

DEAR SIR,

1. In furnishing the information called for by your letter of 24th April, it may be appropriate to begin by setting out briefly the history of this Company, more particularly in relation to the manufacture and supply of arms and munitions of war.

2. Hadfields, Ltd., was originally founded in 1869 by Mr. Robert Hadfield under the title of Hadfields Steel Foundry. Mr. Hadfield died in 1888 at which time the concern was in process of conversion into a limited liability Company and was registered as such in 1888 under the title of Hadfields Steel Foundry Company, Ltd. The title was changed to Hadfields, Ltd., in 1913.

3. Their interest in the subject matter of your letter may be said to have commenced in 1880 when the "Committee on Plates and Projectiles" were

engaged upon a series of experiments in the attack of the newly invented steel-faced armour against which the chilled iron Palliser shot previously in use were proving ineffective.

4. At that time the firm was engaged upon the manufacture of steel castings generally, and Mr. Hadfield conceived the idea of utilising for the above-mentioned purpose a shell made of a special cast steel. In due course he was offered a practical trial and although these first samples did not solve the immediate problem, they formed the beginning of an association which has continued ever since.

5. The era was one of new ideas and development of artillery material, and the use of cast steel for projectiles of all types offered to his progressive enterprise a welcome scope for research and experiment. As a result, satisfactory types of cast steel shell were evolved for general use in British Naval and Coast Defence Services and were manufactured and supplied by the firm in regular and increasing quantities.

6. In the meantime constant research and experiment were proceeding on the major problem of the armour-piercing shell which remains to-day one of the most exacting and difficult metallurgical feats, and it was not until 1888 that the knowledge and experience gained were such as to enable a contract for the supply of 1,200 6-in. armour-piercing shell to be undertaken by the Company. These shell met the difficult requirements of proof, and from that time onwards progress was continuous.

7. During the next twenty years, by the same process of research and experiment, they built up a technical organisation which placed them in a predominant position in this specialised line of work, as evidenced by the fact that for seven years prior to the War they supplied about 50 per cent. of the total Government requirements of this nature. The value of this organisation to the country during the War may be estimated from the record of our war productions which is given in our reply to Question 6 of your letter.

8. During this time they manufactured other types of shell with a view to finding continuous employment of their ordnance department which represented about 18 per cent. of their total trade, the balance being purely commercial products, and in 1904 they introduced a type of cast steel armour which was adopted by the Admiralty for various structures in their current warship designs.

9. Their predominant interest in munition work, however, has always been the manufacture of armour-piercing shell, a subject demanding the highest degree of metallurgical skill and technique, and in which they have been able to introduce from time to time important improvements to which can fairly be attributed the present high standard of efficiency in this respect which the British Service can now command.

10. The detailed information for which you ask is set out herein, or in some cases in schedules attached hereto, against the various items in question. It will be appreciated that these records include matter of a highly confidential nature, and we must ask that the information given in our replies in respect of items 7 and 8 shall not be published. We submit further that it would not be in the public interest to publish certain portions of the other information given.

11. The subsidiary Companies under our control are included in Schedule "B" attached hereto. As none of these has produced any arms or munitions of war during the period under review, there are no figures to submit in respect of them.

12. To facilitate reference, we set out hereafter each item of your enquiry with the information desired appended thereto.

* Not printed.

6 February, 1936.]

Messrs. HADFIELD, LTD.

[Continued.]

Item 1.—The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war.

The proportion required is given below as a percentage, computed upon invoiced values during the periods in question.

Year.	Per cent.
1930	12.70
1931	17.76
1932	19.59
1933	17.46
1934	17.65

Item 2.—The proportion of the turnover in each of the last five years representing arms and munitions of war attributable to (a) United Kingdom, (b) British Empire, and (c) foreign, Orders.

The proportions, computed as before, are as follows:—

	1930.	1931.	1932.	1933.	1934.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
United Kingdom	70.49	87.63	100.00	99.82	99.57
British Empire	2.85	.16	—	.18	.35
Foreign	26.66	12.21	—	—	.08
	100.00	100.00	100.00	100.00	100.00

The foreign orders shown in the years 1930 and 1931 are exclusively comprised of 14-in. armour piercing shell supplied to the Imperial Japanese Navy under a contract dating from 1924.

Item 3.—The estimated value of plant employed in the production of arms and munitions of war that would be rendered redundant in the event of the establishment of a State monopoly.

For this purpose we have taken the present day replacement value of our capital assets employed upon the production of arms and munitions of war and the proportion of that so employed in common with other production, these proportions being computed upon the basis of the respective annual output tonnages of the two classes of work during the five years under consideration.

On this basis the value is £850,000, the details of which are as follows:—

	£
Land	50,000
Buildings	224,500
Fixed Plant and Machinery	507,500
Movable Plant	35,000
Loose Plant, Tools and Equipment	30,000
Offices	3,000
	£850,000

Item 4.—The amount of declared profits of each of the last five years; an estimate of the proportion thereof attributable to the production of arms. (To be accompanied by published accounts for the five years.)

This computation is complicated by the fact that the period 1930 to 1934 represented an abnormal cycle of trade depression during which the Company was unable to provide for any depreciation in their accounts, the omission to do so having been subsequently rectified in a Scheme of Reorganisation which included a writing down of assets by £1,020,810, of which £972,624 was attributable to buildings, plant and machinery.

For this reason, in preparing an estimate of the proportion of profit attributable to the production of arms and munitions of war, it has been considered equitable to charge a sum equivalent to 2½ per cent. per annum upon the value of our buildings and 7½ per cent. per annum upon the value of our plant and machinery against our total productive cost, allocating a due proportion against that of arms and munitions of war.

The values of plant and buildings referred to are, of course, book values, as distinct from replacement values as given in answer to item 3.

We have also eliminated all charges for debenture interest, provision for income tax, and income from investments. On this basis the profit or loss attributable to the manufacture of arms and munitions of war has been estimated in consultation with our Auditors and is given as follows for the five years in question, in a form which admits of their reconciliation with our published accounts, copies of which are enclosed as requested.*

—	Profit or Loss per Published Accounts.	Adjustments referred to above.	Resulting Profit or Loss.		
			Total.	Arms and Munitions of War.	Commercial.
	£	£	£	£	£
1930	16,593	92,108	108,701	10,330	98,371
1931	36,206	83,117	119,323	10,344	108,979
1932	21,623	107,239	128,862	1,667	127,195
1933	32,180	82,392	50,212	18,639	68,851
1934	93,996	111,093	17,097	30,471	47,568

Item 5.—The average number of employees engaged in each of the last five years on the production of arms and munitions of war and other products, respectively.

The information desired has been extracted from our contemporaneous records as follows:—

Year.	Number of Employees.		
	Armaments.	Commercial.	Total.
1930	564	3,898	4,462
1931	582	3,441	4,023
1932	501	3,187	3,688
1933	567	2,994	3,561
1934	616	3,436	4,052

Item 6.—The firm's capacity for expansion for purposes of the production of arms and munitions of war (a) with, (b) without, the use of plant normally employed on other products. What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war.

[Reply not printed.]

Item 7.—Particulars of any agreements with other firms engaged in the production of arms, stating the names of the parties (British and foreign) to such agreements.

A list of the agreements desired, with particulars as regards objects and membership is appended hereto and marked Schedule "A".*

* Not printed.

6 February, 1936.]

Messrs. HADFIELDS, LTD.

[Continued.]

Item 8.—Details of the firm's present holdings of the capital of other firms (giving names British and foreign), and of the holdings of the firm's capital by other firms (giving names British and foreign).

The details desired are given in three Schedules* attached hereto and headed as follows:—

Schedule "B".—Particulars of the holdings of the capital of other firms by Hadfields, Ltd., as at 30th June, 1935.

Schedule "C".—Details of the holdings of Ordinary and Preference share capital of Hadfields, Ltd., by other firms as at 30th June, 1935.

Schedule "D".—Details of the holdings of Hadfields, Ltd., Debenture stock by other firms as at 30th June, 1935.

Schedule "B" has been sub-divided into three sections, showing (1) subsidiary companies, (2) trading investments, and (3) holdings taken in satisfaction of indebtedness.

In Schedules "C" and "D" we have included all those holdings which stand in the names of nominees in order to ensure that all holdings by other firms have been included, but, with the exception of the holding of Debenture stock by Birch Lane nominees (which represents our own purchases of our Debenture stock in the open market), we have no knowledge of the real holders of any stock or shares held by nominees and, so far as we are aware, beyond the qualification shares of our own Directors, no shares or stock are held for any other purpose than that of bona fide investment.

Item 9.—The practice of the firm in regard to the advertisement of, and soliciting of orders for, arms and munitions of war.

Our regular advertising of arms and munitions of war consists of a page in *Brassey's Naval and Shipping Annual*, and the issue of about 100 pocket diaries. This may be occasionally supplemented in special circumstances. It is not the practice of the firm to solicit orders of this nature, but we deal with enquiries as and when they are received.

Trusting that this information will meet your requirements,

I am,

Yours faithfully,

(Sgd.) A. B. H. CLERKE,
Managing Director, Hadfields, Ltd.

3230. *Chairman*: In Schedule "B" you put under the first heading "Subsidiary Companies." Would you mind looking at that for a moment? All those subsidiary companies are English companies, are they not, with the exception of a French company—the last but two in your list—in which you hold 30 ordinary shares?

Major Clerke: Those are trading investments. 3231. *Chairman*: Yes, subsidiary companies and trading investments. They are all English companies, are they, with the exception of that French company?

Major Clerke: Yes, that is so. One of the subsidiary companies, the South African, is merely a sales agency. It is practically a department of our own.

3232. *Chairman*: What is the name?

Major Clerke: Hadfield's (South Africa) Proprietary.

3233. *Chairman*: Is that in South Africa?

Major Clerke: Yes, that is in South Africa. That was merely to conform to the local laws.

3234. *Chairman*: The other question that I want to ask is this. I do not want to go too deeply into it, but you have had experience both of private manufacture and of Woolwich have you not?

Major Clerke: I have been in Woolwich Arsenal, but I have not been in the ordnance

factories. I may say I have been an observer. Woolwich Arsenal buildings contain other departments than the ordnance buildings themselves. I was in the inspection department.

3235. *Chairman*: We have been told that it is possible to compare the cost at Woolwich with the cost of the private manufacture of munitions. Have you anything to say about that, or have you not sufficient experience of the method at Woolwich to be able to give us any information?

Major Clerke: Yes and no. It is 25 years since I was there, and no doubt things have altered a good bit since then. I think it is common ground that in the old days before the War the system of costings in Woolwich Arsenal was imperfect—shall we say—or if you like to put it, rather loose. I think there was a certain amount of adjustment of charges according to the nature of the work. I cannot say what the system is now, but I believe it has all been altered and put on a more scientific basis.

3236. *Professor Gutteridge*: Have the Admiralty a system by which they inspect the work which is in progress?

Major Clerke: Yes.

3237. *Professor Gutteridge*: They have a resident inspector?

Major Clerke: Oh, yes; very much so. We have a large Admiralty bond in our works, which is their territory.

3238. *Professor Gutteridge*: Did you call it a "bond"?

Major Clerke: Yes, like an excise bond.

3239. *Professor Gutteridge*: It is like a bonded warehouse?

Major Clerke: Yes, and it is their territory. They have their own staff of examiners there and it is shut off. They lock it up at night.

3240. *Professor Gutteridge*: Therefore, the Admiralty would know very well what you were doing?

Major Clerke: Oh, absolutely. They are walking around our shops all the time.

3241. *Professor Gutteridge*: They know what you are making for foreigners?

Major Clerke: Yes.

3242. *Professor Gutteridge*: There has been a suggestion with regard to the relief base shell, that you have been giving away some very important information to foreigners. Have you anything to say about that?

Major Clerke: I am afraid it is a myth.

3243. *Professor Gutteridge*: Is there any foundation for it?

Major Clerke: None at all.

3244. *Professor Gutteridge*: There is an advertisement in *Brassey's Naval Annual*.

Major Clerke: Yes.

3245. *Professor Gutteridge*: It says, *Hadfield's latest invention, the patented relief base shell, solves the problem of oblique attack on armour at modern battle ranges*.

Major Clerke: There is no secret about that. It is a patent, and anyone can read it.

3246. *Professor Gutteridge*: Your point is that it is public property already?

Major Clerke: Oh, yes, there is no secret about it.

3247. *Professor Gutteridge*: I take it the manufacture of a naval shell is a very different process from the manufacture of, say, a 4.5 howitzer shell?

Major Clerke: Yes.

3248. *Professor Gutteridge*: Is it much more elaborate?

Major Clerke: It is on a totally different plane from the manufacture of high explosive. The navy use those also but they are a simple and straightforward engineering proposition.

3249. *Professor Gutteridge*: Do you say this is not?

Major Clerke: The manufacture of armour piercing shell is a very highly scientific metallurgical operation. The mechanical side of it is

* Not printed.

6 February, 1936.]

Messrs. HADFIELD, LTD.

[Continued.]

unimportant. The real art of it is in the metal-lurgical and thermal treatment.

3250. *Professor Gutteridge*: Does that require specially skilled labour?

Major Clerke: Yes, and, particularly, specially skilled supervision.

3251. *Professor Gutteridge*: I take it you have that available at your works?

Major Clerke: Yes.

3252. *Sir Philip Gibbs*: When you say that the criticism about the armour piercing shell is a fallacy or a myth, do you base that on the point that it is a public patent?

Major Clerke: Professor Gutteridge asked if we were giving away any secrets. I say that is a myth. It is a patent.

3253. *Sir Philip Gibbs*: Ought not there to be secrets with regard to that?

Major Clerke: That is not for us to say.

3254. *Sir Philip Gibbs*: I was wondering what is your policy with regard to a new invention. I suppose you would admit that this new Hadfield armour piercing shell is of very great importance, would you not?

Major Clerke: We thought so.

3255. *Chairman*: Did you patent it?

Major Clerke: We have patented it.

3256. *Professor Gutteridge*: The government could have stopped your doing that had they wanted to?

Major Clerke: Yes, had they wanted to.

3257. *Chairman*: Directly it is patented it becomes public property in the sense that the information is available from the description of the patent?

Major Clerke: That is the essence of a patent.

3258. *Sir Philip Gibbs*: It would be impossible for any country to use that armour piercing shell unless they bought your patent?

Major Clerke: Legally, yes.

3259. *Sir Philip Gibbs*: They might crib it?

Major Clerke: Yes.

(The witness withdrew.)

Mr. ALLAN J. GRANT, J.P., managing-director, Messrs. Thomas Firth and John Brown, Limited, called and examined.

3268. *Chairman*: You are here representing Messrs. Thomas Firth and John Brown, Ltd.?

Mr. Grant: Yes, Sir.

3269. *Chairman*: I am told that you are managing-director of the merged concerns of Thomas Firth and John Brown, and that formerly you were managing-director of John Brown?

Mr. Grant: Yes.

3270. *Chairman*: Before that you were with Laird Bros.?

Mr. Grant: Yes, as a youngster.

3271. *Chairman*: In 1932 you were elected the president of the National Federation of Iron and Steel Manufacturers (now the British Iron and Steel Federation) and in that year you were leader of the British steel delegation to the Imperial Conference at Ottawa. You are also a member of the Board of Trade advisory council representing the steel industry. You are chairman of Firth-Vickers Stainless Steels, Limited, and the Firth-Brearley Stainless Steel Syndicate, a director of Cravens Railway Carriage & Wagon Co., Ltd., Nasmyth Wilson & Co., Ltd., and British Acheson Electrodes, Limited?

Mr. Grant: Yes.

3272. *Chairman*: You have done what the other companies have done, you have supplied us with a full detailed answer to our questionnaire. We generally have it read. Will you read it yourself, or would you like it read for you?

Mr. Grant: Would the secretary be good enough to read it?

3260. *Sir Philip Gibbs*: Actually you did sell that patent to certain countries?

Major Clerke: No.

3261. *Chairman*: You gave licences, did you not?

Major Clerke: No.

3262. *Sir Philip Gibbs*: A statement was made by a witness in previous evidence that you had sold it to something like eight foreign countries.

Major Clerke: No. He said it was patented in eight countries. We did not sell it.

3263. *Sir Philip Gibbs*: You have not sold any of this armour piercing shell to foreign countries?

Major Clerke: We have not delivered any shell —may I put it that way. We have not manufactured or delivered shell to that patent. You are pressing me on things that are semi-confidential. I am quite willing to tell you privately.

3264. *Sir Philip Gibbs*: May I ask you a specific question which, as a matter of fact, actually appears in your statement, about the Japanese navy and the 14-inch shells. Is not that one of the new armour piercing shells?

Major Clerke: No, it was before the date of the patent.

3265. *Sir Philip Gibbs*: Have you any agreement at all with foreign firms as to reciprocity in invention?

Major Clerke: We have one with our neighbours Messrs. Firth. That I have catalogued here.

3266. *Sir Philip Gibbs*: You have no arrangement with any foreign firm for providing them with any new invention?

Major Clerke: Not for anything in the nature of munitions.

3267. *Sir Philip Gibbs*: Or armour plate? You would not count armour plate as ammunition, would you?

Major Clerke: It depends, but we have not provided them with that either.

Chairman: We are much obliged to you for the information that you have given.

The following letter and enclosures were read or taken as read:—

Atlas & Norfolk Works,
Sheffield, 1.
2nd October, 1935.

SIR,

We have the honour to refer to your letter of the 24th April in which, for the purposes of the Inquiry now being held by the Royal Commission on the Private Manufacture of and Trading in Arms, you desire full information under various headings referring to this Company or to any Subsidiary Companies under its control. We also beg to refer you to our reply of the 29th April in which we expressed our willingness to disclose information of any kind which may be of advantage to the Royal Commission.

In enclosing the replies to the various questions, we think that it might be useful to the Commission to state briefly the previous history of the firm and its long connection with the supply of arms and armaments for the fighting forces of the Crown.

The present concern, Thos. Firth & John Brown Ltd., is the result of an amalgamation which took place on the 1st January, 1931, between the old established firms of Thos. Firth & Sons, Ltd. and the steel interests of John Brown & Company, Ltd. The business of Thos. Firth & Sons was established by Mr. Thomas Firth in the year 1842 in Sheffield and became famous at a very early date for the supply of high class special steels, including gun forgings and shell. The personnel has always been carefully chosen for its expert knowledge of the high class of steel required for these purposes, and over a long

6 February, 1936.]

MESSRS. THOMAS FIRTH AND JOHN BROWN, LTD.

[Continued.]

period technical improvements have been made which have always kept the firm in the forefront of progress in these directions. The works of John Brown & Company in Sheffield were founded by Sir John Brown in 1838 and turned into a limited liability company in 1864, and in addition to being large suppliers of steel for commercial purposes they specialised at a very early date in the manufacture of armour plate and gun forgings, and have had a long and successful connection with the British Admiralty for the supply of armour plates for the vessels of His Majesty's Fleet.

During the period of depression to which the steel industry was subjected since the War, the demands on both steel works fell considerably, and in accordance with the reorganisation which has been in progress in the steel industry, it was considered advisable to amalgamate the two concerns, who had always been closely allied with regard to directors and shareholding interests, but who had hitherto been run as separate establishments from a technical and commercial point of view. This fusion took place, as mentioned above, in January, 1931.

Definite answers are given, in the particulars attached, to the questions asked, as far as is possible, but in view of the evidence which has already been tendered we think it might be of interest to state briefly the experiences of both concerns at the outbreak of hostilities in 1914.

To take the case of Thos. Firth & Sons, as it was at that time, it was obvious that the most useful direction in which they could collaborate in the national interest, would be primarily in the direction of shell manufacture, with which the firm has always been closely associated, their connection with it dating back to the days of the old round shot produced in dies from crucible steel.

Prior to August, 1914, Firth's had undertaken with success a number of contracts for high explosive shell, but there had been a gap of some three to four years immediately preceding the date mentioned when these shell had been absent from their programme due to the absence of orders. Immediately on the outbreak of war, Firth's drew the attention of the responsible officials of the War Office to the general lack of facilities for the rapid production of this class of shell, and to assist in remedying this serious situation they installed additional plant in their existing shops, and rapidly erected in their Tinsley Works several large shops both for forging and machining. These steps were necessary owing to the fact that their existing plant was filled to repletion with orders for naval shell. In addition, they put forward a scheme for utilising the machining resources of many firms usually engaged in the production of textile machinery or other lines for which the demand had practically ceased owing to the War. This scheme was accepted, and Firth's succeeded in enrolling the whole of the more important textile firms in Lancashire, together with a number of the outstanding firms in the Glasgow area, which latter group were, at a later date, handed over to the Ministry of Munitions at their request to form the nucleus of the organisation to be controlled by the Scottish National Board. The whole of the sub-contractors were originally entirely unfamiliar with this class of work, but by means of frequent round table conferences, demonstrations given to them in our works, regular visits from technical members of our staff, and the aid of detailed drawings for each and all of the operations, they were rapidly transformed into economical production units.

In 1915, Firth's were asked to undertake the responsibility of erecting a National Projectile Factory at Templeborough, which they were able to do with great rapidity by making use of their existing organisation, who were, of course, entirely familiar with the requirements of such a plant. The factory was built, fully equipped and staffed, and put into operation within little more than six months from the time the site was acquired.

A further constructive step taken by Firth's was to requisition the services of their Associated Company—The Washington Steel & Ordnance Company—in the manufacture of naval shell, so releasing home plant for army shell, a measure which in practice, worked extremely well.

In the circumstances described, and bearing in mind that for several years before the War Firth's had not supplied army shell, or held in reserve plant for that purpose, it was inevitable there should be some delay on the outbreak of war before they were able to supply shell of this type in large numbers, but notwithstanding this initial disability for which they were in no sense responsible, Firth's commenced to make large deliveries of army shell at the beginning of February, 1915, and continued to supply in ever increasing quantities during the whole course of the War.

In view of the arguments put forward in favour of the abolition of the private manufacture of armaments, it should be emphasised that there is technically a wide gulf between the manufacture of high explosive shell for land purposes, which can be considered to be an ordinary engineering product when properly organised, and the manufacture of armour-piercing shell for naval purposes. The latter involves very difficult technical questions affecting steel manufacture and heat-treatment and requires the services of a highly technical staff accustomed to dealing with questions of this nature. Realising these difficulties in manufacture the following points may be of interest in connection with armour-piercing shell.

In 1908 Firth's introduced the hollow cap, which may truthfully be said to have advanced the standard of A.P. Shell performance more than any other single factor in its long existence. In 1913, a further development occurred in the invention of an improved form of hollow cap which proved to be a most effective means of defeating armour under oblique attack. It should here be mentioned that this achievement, and subsequent improvements thereon, were not only due to work and research carried out in Firth's Works in Sheffield, but were contributed to by the appreciable experiments carried out in their works in Riga (Russia) and in the American Companies—Firth Sterling Steel and Washington Steel and Ordnance, in which they were interested at that period. The latter Company has now ceased to exist. The national importance of foreign contracts is worthy of emphasis for it has the virtue of keeping us in touch with the line of thought prevailing in other countries, gives definite knowledge of their activities, widens the field for experimental work under varying conditions, and enables the technique of our experts and highly trained workpeople to be maintained at a high level.

With regard to John Brown & Company, this firm had always specialised principally in naval work, and in addition, they were at the outbreak of war, part owners of the Coventry Ordnance Works, and their activities were then directed primarily to the supply of the necessary material to satisfy the wants in these connections. It will be remembered that there was an immediate expansion in the number of war vessels, particularly destroyers; and by placing their capacity at the service of the Admiralty they were, in a very brief period, able to increase the supply of forgings for propelling machinery for war vessels to such an extent that after a few months they were supplying a complete set of forgings for destroyers at the rate of one a fortnight. Half this output was sent to John Brown & Company's Shipyard at Clydebank and the other half was distributed among the various destroyer builders, such as Thornycroft, Yarrow, etc., in different parts of the country, as instructed by the Admiralty. This rate of output was maintained to the end of the War, and in addition, forgings were produced for battle cruisers, such as H.M.S. *Repulse* and H.M.S. *Furious* etc. Besides this, the Coventry Ordnance Works received large orders for howitzers, and in the very early stages of the War the forgings

6 February, 1936.]

MESSRS. THOMAS FIRTH AND JOHN BROWN, LTD.

[Continued.]

necessary for the manufacture of the 15-inch howitzer were produced in record time, and thereafter a large number of 4.5-inch howitzer forgings and other gun forgings for the Army were produced on a very large scale. It was always considered, however, that the Admiralty had the first call on the Brown plant, and land service requirements such as the gun forgings mentioned above, and shell billets, were utilised to fill up the remainder of the firm's capacity. Commercial work, of course, entirely ceased, but production of the high class steels required for war purposes presented no particular difficulty to the highly skilled technical staff and workmen who had been engaged on this class of material, certainly in much smaller quantities, in the pre-war years, and was only limited by the possibility of plant extensions and the number of men available.

Since the War, the firm has remained at the disposal of the Admiralty, and by agreement with that department, has kept available the necessary special plant required for the manufacture of armour together with the technical experts essential for its production, so as to have sufficient capacity as laid down by the Admiralty, although the orders available have been only a very small proportion of the potential output. Should it be desired that private manufacture of arms is to cease, it would become necessary to dispense with expert staff and to dismantle the armour department, which is of no value for commercial purposes. It may be stated that the value of the plant and the area of the shops occupied amounts to a substantial proportion of the whole of the Atlas Works.

We desire to draw attention to one phase of the evidence which has already been given and which appears to be very widely held among the uninstructed public, namely, that active propaganda is indulged in by the armament firms for the fomenting of international disputes and the soliciting of orders abroad. We can only speak for our own firm, but we wish categorically to deny the truth of these statements, as it has never been the practice of this firm to solicit orders abroad for war material. The reputation of the concern, however, is almost world wide and naturally when enquiries have been received from foreign sources for material which was within our range of manufacture, we have quoted for its supply in the endeavour to bring work to this country, to increase employment in Sheffield, and to keep together the men necessary for its production. It will be seen from the figures given in the answers to the questions, that the amount of foreign armament material supplied has been very small, permission always having been granted by the appropriate British Government Department.

We desire to make the following observations with regard to the answers to Question No. 7 with reference to associations. It will be within the knowledge

of the Commission that the steel trade in this country has for many years been partially organised by means of trade associations among firms dealing with products of the industry of a like nature. These organisations have, with full Government approval, been recently much extended through the British Iron and Steel Federation under the chairmanship of Sir Andrew Duncan. Most of the associations have the same object, namely, to prevent as far as possible, suicidal internal competition by the establishment of a reasonable selling price, to avoid the wasteful multiplication of estimating work, and by the allocation of orders to ensure that, as far as possible, work is distributed fairly in different parts of the country so that one district, owing to a particular geographical advantage, may not prosper at the expense of another less favourably situated.

The arrangements entered between the firms producing arms material are of a precisely similar nature. They also, however, serve an additional purpose as a clearing house for technical information; so that wherever orders may be allocated they are executed with the benefit of the combined technical experience of the associated firms. As the customer in this case is usually a government department the selling price of the material, whether it be armour or shell, is subject to scrutiny from the accountant officers of the government department concerned, and the selling price is mutually arranged between the firms and the appropriate government department. It may be asked, if this is the practice, how losses are shown in many of the years' figures submitted in answer to Question 4; this can be accounted for by the fact that in those particular years the orders given were comparatively small and totally inadequate to cover the standing charges incidental to the maintenance of the highly technical staff necessary.

We beg to request that in fairness to our own shareholders, information given in reply to the questionnaire which discloses figures of investments, turnover and profits that might be of advantage to competitors, both at home and abroad, and other information which might be detrimental to the national interest, may be regarded as confidential.

We are, Sir,

Your obedient Servants,

THOS. FIRTH & JOHN BROWN, LIMITED.

(Sgd.) ABERCROMBAY,

Chairman.

Edward Twentyman, Esq.,

Royal Commission on the Private

Manufacture of and Trading in Arms,

8, Buckingham Gate,

London, S.W.1.

Question No. 1.

The proportion of the total turnover in each of the last five years attributable to the production of arms and munitions of war.

Answer.

The following Table shows the proportion of the total monetary value of the turnover attributable

to the production of arms and munitions of war, for the years 1930 to 1934, both inclusive, the first year of the period representing a combination of the turnover of John Brown & Co., Ltd., and Thos. Firth & Sons, Ltd., carrying on business in that year as separate entities, the four succeeding years representing the turnover of Thos. Firth & John Brown, Ltd., operating as a single concern.

Total Value of Deliveries.		Arms and Munitions of War.		Commercial Work.	
Year.	Amount.	Amount.	Percentage of Total.	Amount.	Percentage of Total.
	£	£		£	
1930	2,114,484	206,356	9.76	1,908,128	90.24
1931	1,470,685	120,638	8.20	1,350,047	91.80
1932	1,271,789	112,338	8.83	1,159,451	91.17
1933	1,745,989	238,176	13.64	1,507,813	86.36
1934	2,446,949	316,495	12.93	2,130,454	87.07

6 February, 1936.]

MESSRS. THOMAS FIRTH AND JOHN BROWN, LTD.

[Continued.]

Question No. 2.

The proportion of the turnover in each of the last five years representing arms and munitions of war, attributable to (a) United Kingdom, (b) British Empire and (c) foreign, orders.

Answer.

The following Table supplies the answer to this question, and should be read in conjunction with the answer to Question No. 1.

Year.	United Kingdom.		British Empire other than United Kingdom.	Foreign.		Total.
	Amount.	Percentage of Total.		Amount.	Percentage of Total.	
	£			£		£
1930	115,213	55.83	—	91,143	44.17	206,356
1931	91,016	75.45	—	29,622	24.55	120,638
1932	101,156	90.05	—	11,182	9.95	112,338
1933	224,983	94.46	—	13,193	5.54	238,176
1934	311,120	98.30	—	5,375	1.70	316,495

Question No. 3.

The estimated value of plant employed in the production of arms and munitions of war, that would be rendered redundant in the event of the establishment of a State monopoly.

Answer.

It will be manifest that to prepare a statement in detail with the necessary supporting evidence of the cost of setting up on its own site a well equipped plant capable of taking the place of the Company's plant for the production of arms and munitions of war, would occupy considerable time, and we have

therefore assumed that the purpose of the Commission will be served if an approximate cost only is furnished, based on the opinion of the Company as to what might be required.

Subject to the foregoing explanation we submit in the two attached Schedules brief particulars of our estimate of the cost of providing plants for the production of (a) armour plate, and (b) armour piercing shell, torpedo components, ship shafting and allied products.

Schedule (A) amounts to £1,271,070; (B) £887,500, making a total of £2,158,570.

SCHEDULE A.

ARMOUR PLATE FORGING PRESS—ROLLING MILLS—TREATMENT AND MACHINING PLANTS.

Summary of Estimated Capital Value.

Description.	Forging Press.	Rolling Mills.	Treatment Furnaces.	Bending Press.	Machine and Erecting Shops.	Melting Furnaces.	Miscellaneous.	Total.

Question No. 4.

The amount of declared profits of each of the last five years; and an estimate of the proportion thereof attributable to the productions of arms and munitions of war. (The above to be accompanied by published accounts for the five years.)

Answer.

The purpose of this question has been interpreted to ascertain what proportion of the profit or loss, of the total production of the Company, accrued from the manufacture and sale of arms and munitions of war.

If this interpretation is correct, it is considered that there must first be eliminated all income arising from investments which are in no way related to the production of armaments, and secondly, in order that the profits as a whole shall be shown without charge for interest on the permanent loan capital, there must be eliminated on the expenditure side, debenture and mortgage interest, and thirdly, in order that the figure between one year and another may be strictly comparable, there must be substituted for the provisions made in each year's accounts, if any, to cover depreciation, the amount which would have been charged had the revenue of each year been made to bear the proper and adequate allowance for depreciation calculated at uniform rates on reducing values. Subject to the foregoing explanation, the following are the answers to the questions asked:—

(1) Profit and loss of each of the last five years, per published balance sheets, as attached hereto,* viz.:—

	£
Year 1930. Profit ...	10,902
" 1931. Loss ...	44,670
" 1932. Loss ...	75,950
" 1933. Profit ...	12,519
" 1934. Profit ...	345,039

(2) Profit and loss of each of the last five years, per published balance sheets, after charging depreciation on the reducing values at the rate of

* Not printed.

2½ per cent. on buildings and 7½ per cent. on plant and machinery, and eliminating debenture and mortgage interest payable by the Company, and on the other side, income from investments belonging to the Company, viz.:—

	£
Year 1930. Loss ...	96,055
" 1931. Loss ...	95,301
" 1932. Loss ...	174,833
" 1933. Profit ...	10,085
" 1934. Profit ...	317,339

(3) Division of (2) between—

	Arms and Munitions of War.	Commercial.
	£	£
Year 1930 ...	Loss 8,806	Loss 87,249
" 1931 ...	Profit 2,692	Loss 95,993
" 1932 ...	Loss 27,043	Loss 147,840
" 1933 ...	Loss 3,522	Profit 13,607
" 1934 ...	Profit 46,315	Profit 271,024

The foregoing figures relate solely to Thos. Firth & Sons, Ltd., for the year 1930, and to Thos. Firth & John Brown, Ltd., for the subsequent years.

The corresponding figures to those shown in part 3 of the answer to Question No. 4, as regards John Brown & Co., Ltd., for the year 1930, are as follows:—

	Arms and Munitions of War.	Commercial.
Year 1930 ...	Loss £2,689	Loss £41,677

Question No. 5.

The average number of employees engaged in each of the last five years on the production of arms and munitions of war, and other products, respectively.

Answer.

The term "employees" has been interpreted to include every person in the service of the Company whatever position occupied, and the figures in the subjoined table for the year 1930, are a combina-

6 February, 1936.]

Messrs. THOMAS FIRTH AND JOHN BROWN, LTD.

[Continued.]

tion of those appertaining to John Brown & Co., Ltd., and Thos. Firth & Sons, Ltd. It will be noticed that relatively to turnover the total number of people employed was less in 1934, than 1930, a circumstance which is explained in part by the greater turnover in the latter year, but in a still greater measure by the economy realized in the use of labour as a result of the amalgamation of the steel businesses of Thos. Firth & Sons, Ltd., and John Brown & Co., Ltd., at the beginning of 1931.

Year	Proportion of War. Munitions		Proportion of other Products		Total.
	Arms	Munitions	Arms	Munitions	
1930 ...	677	4,816	599	4,125	5,493
" 1931 ...	555	3,502	701	4,547	4,724
" 1932 ...	797	4,391			4,057
" 1933 ...					5,188
" 1934 ...					

Average number per week.

Question No. 6.

The firm's capacity for expansion for purposes of the production of arms and munitions of war (a) with, (b) without, the use of plant normally employed on other products. What would be the effect of a State monopoly on the firm's capacity for production of arms and munitions of war on the outbreak of war?

[Reply not printed.]

Question No. 7.

Particulars of any agreements with other firms engaged in the production of arms and munitions of war, stating the names of the parties, British and foreign, to such agreements.

[Reply not printed.]

Question No. 8.

Details of the firm's present holdings of the capital of other firms, giving names (British and foreign), and of the holdings of the firm's capital by other firms, giving names (British and foreign).

[Reply not printed.]

Question No. 9.

The practice of the firm in regard to the advertisement of, and the soliciting of orders for, arms and munitions of war.

Answer.

It is not the firm's practice to solicit orders or advertise for Arms and Munitions of War. We only respond to such enquiries as are sent to us, and which are made known to the Government of our own country.

3273. *Chairman*: The only question I want to ask has reference to your confidential annex. It is a fact, is it not, that with two exceptions the agreements to which you refer in your annex are all agreements which have been entered into with British firms under this rationalising arrangement?

Mr. Grant: Yes.

3274. *Chairman*: Of those two exceptions, one is the nickel agreement, of which we know, and the other is an agreement about which we have not heard—the Torpedo Air Vessel Forgings agreement?

Mr. Grant: Yes.

3275. *Chairman*: That is an agreement in which there are three English firms and two foreign firms concerned?

Mr. Grant: Yes.

3276. *Chairman*: And it is confined solely to air vessel forgings and ends "offered outside Great Britain, Sweden and Czecho-slovakia"?

Mr. Grant: Yes.

3277. *Chairman*: And in order to regulate the price concerned. With that exception, they are all British firms?

Mr. Grant: Yes.

3278. *Sir Kenneth Lee*: In your letter you attach great importance to the foreign business because of the information that it gives you?

Mr. Grant: Yes.

3279. *Sir Kenneth Lee*: Have you agents?

Mr. Grant: Yes, we have.

3280. *Sir Kenneth Lee*: And they will be active in soliciting orders?

Mr. Grant: Not armament orders. We have not anybody engaged in soliciting armament orders at all.

3281. *Sir Kenneth Lee*: How do they get the information which is valuable to keep you up to date?

Mr. Grant: I am afraid this paragraph of my letter is rather more historical than an indication of what actually happens at the present time. The agents that we have abroad, for instance, in Belgium and one or two other countries, are selling other products. What actually happens is this. We do not solicit orders, but if we receive an inquiry from abroad we respond to it. I assure you that most of the agents are not in any way connected with the armament side of the concern and they do not understand it.

3282. *Sir Kenneth Lee*: So that really the information is not very important?

Mr. Grant: No, it is not.

3283. *Sir Kenneth Lee*: Your foreign business has practically dropped to nothing?

Mr. Grant: As far as the armament business is concerned, as you see from the figures, it is practically nil.

3284. *Sir Kenneth Lee*: So you could give it up without loss?

Mr. Grant: As things are at the moment.

3285. *Sir Kenneth Lee*: Apart from the indirect value that you attach to it.

Mr. Grant: All these orders are of value, but it is a fact that foreign orders for armament material have not been an appreciable item in our figures for the last few years.

3286. *Sir Kenneth Lee*: The value of the information that you get from the point of view of keeping you up to date is negligible?

Mr. Grant: Yes, I should say that is so now.

3287. *Sir Philip Gibbs*: May I ask you why in 1930 the percentage of your foreign business in armaments was 44 per cent., which seems very high?

Mr. Grant: That was one order. It was for these torpedo air vessels and at that time the whole figure for armaments was pretty low, so that one specific order made a great difference to the percentage.

3288. *Sir Philip Gibbs*: Are you prepared to accept orders from any country according to whether you can get a British licence?

Mr. Grant: No. We should always take any orders from foreign countries with the permission of the appropriate government department which, as far as we are usually concerned, is the Admiralty.

3289. *Sir Philip Gibbs*: You put the responsibility entirely on the government?

Mr. Grant: Yes.

3290. *Professor Gutteridge*: I think your first experience was with John Brown, was it not?

Mr. Grant: Yes.

3291. *Professor Gutteridge*: Until when?

Mr. Grant: Until the amalgamation took place in 1931.

3292. *Professor Gutteridge*: They were not a shell making firm, were they?

Mr. Grant: No.

3293. *Professor Gutteridge*: So you cannot throw any light on what happened at Thomas Firth's in 1914?

Mr. Grant: No, not much. I know a certain amount about it.

3294. *Professor Gutteridge*: You are one of the people who have been pilloried for having promised to deliver a great many more shells than you were able to deliver?

6 February, 1936.]

Messrs. THOMAS FIRTH AND JOHN BROWN, LTD.

[Continued.]

Mr. Grant: I have made inquiries into that and there is no trace of that alleged promise having been made. It was probably one of those meetings which took place at the time, when the heads of the different concerns were present and were asked what they could do, and were pressed to do a great deal more than they could possibly perform. There is no evidence, at any rate in our records, that any such promise was made as cited in this evidence. I know enough about the situation at that time to be able to remember very well that the requirements for the army were constantly growing week by week. The army authorities themselves had no idea as to the amount that would be required. It is impossible to evolve a shell out of nothing. You must have the plant and the men there to do it, and it was only by the organisation of the other ordinary engineering firms to which we have referred that we were able to make a very considerable contribution to shell manufacture in the early days of the War.

3295. Professor Gutteridge: And you take considerable credit to yourselves for that?

Mr. Grant: Yes, I think we may.

3296. Professor Gutteridge: That is your answer to the accusation?

Mr. Grant: Yes.

3297. Chairman: In your statement you say that you had works at Riga. Have you works abroad now?

Mr. Grant: No. We have an interest in a company called the Firth-Sterling Steel Company in America—it is given in the schedule—but that company is not engaged in armaments work at all.

3298. Chairman: I see you were with John Brown & Co., who were the owners of the Coventry Ordnance Works?

Mr. Grant: Yes.

3299. Chairman: I do not know the dates. Were you there?

Mr. Grant: Yes, I was.

3300. Chairman: Do you know anything about Mulliner?

Mr. Grant: Yes, Mulliner was there.

3301. Chairman: When you were there?

Mr. Grant: I was at Sheffield when Mulliner was at Coventry.

3302. Chairman: You were at Sheffield with John Brown when Mulliner was at Coventry?

Mr. Grant: Yes.

3303. Chairman: I suppose at first hand you do not know anything about anything that happened?

Mr. Grant: Only by hearsay. I think he did what any of us would do now. He happened to get information that rather more activity was going on in Germany than was generally known. He reported it, and I think very rightly.

3304. Chairman: You say "Since the War the firm has remained at the disposal of the Admiralty, and by agreement with that department has kept available the necessary special plant," and so on. Are you receiving any payment for that?

Mr. Grant: No.

3305. Chairman: Is it merely voluntary?

(The witness withdrew.)

(Adjourned for a short time.)

On resuming,—

Mr. GEOFFREY DUKE BURTON, managing-director, THE BIRMINGHAM SMALL ARMS COMPANY, LIMITED, called and examined.

3311. Chairman: We will take the evidence which has been given by the Birmingham Small Arms Company, and I think, Mr. Burton, that you represent them, do you?

Mr. Burton: Yes, Sir

Mr. Grant: Yes. If I might, I should like to explain a little of how the price of armour plate is arrived at. May I elaborate that?

3306. Chairman: Yes. We shall be only too grateful for any information that you can give us.

Mr. Grant: The procedure is this: Making armour plate is a difficult metallurgical operation and calls for certain constituent materials, such as nickel, pig iron and chromium, of which the trade price is world-wide. When the plate has been made and has gone through various complicated processes it is fired at. It has been stated that there was no competition between the three armour plate firms. I should like to say that as regards quality there is the very keenest competition. There is a firing trial at Shoeburyness. The armour plate has to stand up to a certain velocity and keep out a shell at a given angle. It is a very complicated and technical thing with a new type of plate and a new thickness. The plates from the three firms are fired at and a standard velocity is arrived at, which represents the mean figure of the three results. Then a provisional price is usually arranged over an accounting period of a year during which the quantity of armour plate that will be ordered is known. Naturally the price varies to a certain extent with the quantity. The greater the quantity, the less the percentage of overhead charges and the cheaper it is to make. At the end of that period the Admiralty accountants come down, they see the books of the three firms and they ascertain what it has actually cost to make. Those figures are again averaged. They come out as a rule very near. There may be a few pounds difference between the three firms, but not much more than that. So that the government department—in this case the Admiralty—are fully aware—as much as we—what it costs to make this armour plate. On that information being available, we have a conference with the director of contracts at the Admiralty and a suitable selling price is arranged on top of that, and I assure you that a very hard bargain is driven.

3307. Chairman: That means that the price is not fixed until some considerable time after the article is produced?

Mr. Grant: They fix a provisional price. They know the costs over this particular accounting period, and with the knowledge of those costs the price is fixed.

3308. Chairman: And with regard to the raw materials which are required to make a particular product, you say they are fixed by world-wide trade?

Mr. Grant: Yes, pig iron, nickel, ferro-chrome, all those are market commodities.

3309. Professor Gutteridge: They can find out the price as well as you can?

Mr. Grant: Yes.

3310. Sir Philip Gibbs: Generally speaking, would your prices be checked up by those of Woolwich?

Mr. Grant: Woolwich do not make armour plates and we do not make gun forgings any longer. When the Coventry Ordnance Works were given up, Browns and Firths ceased to make gun forgings, and of course it is only gun forgings on which you can keep a check. But I should say there is no reason why, if we did make gun forgings they could not perfectly well be checked.

Chairman: We are much obliged to you.

6 February, 1936.]

THE BIRMINGHAM SMALL ARMS CO., LTD.

[Continued.]

Mr. Burton: I should be very glad if the secretary would read it, Sir, if he will; and I have a short statement which I thought I might make afterwards.

3314. Chairman: Yes, by all means.

The following letter and enclosure were read:—

The Birmingham Small Arms Co., Ltd.
Small Heath Works, Birmingham.
Managing Director's Office.

July 25th, 1935.

Edward Twentyman, Esq.,

The Royal Commission on the Private
Manufacture of and Trading in
Arms,

8, Buckingham Gate, London, S.W.1.

SIR,

We enclose herewith a statement giving the information asked for in your letter of 24th April last.

In forwarding this statement, we should like to make some observations on the general character and history of the undertaking of the Birmingham Small Arms Company, Limited.

The manufacturing activities of the group are as follows:—

(1) Pedal and motor cycles, cars, small arms, machine guns, sporting guns, are made by the Birmingham Small Arms Co., Ltd., at Small Heath, Birmingham, and sold through B.S.A. Cycles, Ltd., B.S.A. Cars, Ltd. and B.S.A. Guns, Limited.

(2) Motor cars and motor 'buses are made at Coventry, and sold through the Daimler Company, Limited, and the Lanchester Motor Company, Limited.

(3) Small tools and machine tools are made at Sparkbrook, Birmingham, by B.S.A. Tools, Limited, and B.G. Machinery, Limited.

(4) Steel at Sheffield by William Jessop & Sons, Ltd., and J. J. Saville and Company, Limited.

The cycle, motor cycle, gun and machine tool businesses have belonged to the Company for many years, but the interest in the Daimler Company, Limited, was only acquired in 1910, the Jessop and Saville Companies in 1919, and the Lanchester Motor Company in 1932.

The businesses now being carried on at Small Heath by The Birmingham Small Arms Company, Limited, are as set out in (1) above, and the answers to Questions Nos. 1 to 7 and No. 9 in your letter relate to those businesses only.

Although the name of the Company is The Birmingham Small Arms Company, Limited, a large part of its activities have always related to peace-time products, except during war periods, but prior to the Great War the proportion of Government work was very much greater than it is to-day.

The proportion of turnover during the four years ending 31st July, 1913, representing arms and munitions of war were as follows:—

						Per cent.
1913	33.03
1912	25.49
1911	28.95
1910	21.29

The turnover to-day, as will be seen in the answer to Question No. 2, is practically negligible, and this accounts for the comparatively long period required to build up to the outputs mentioned in answer No. 6.

As a result of war experience, the Company was extremely apprehensive as to the supplies of steel for small arms, etc., after the War, and they therefore acquired the businesses of Wm. Jessop & Sons, Ltd., and J. J. Saville & Co., Ltd., Sheffield, to ensure supplies.

Although, therefore, these two companies have become part of our undertaking for the supply of steel for the manufacture of arms, all figures relating to these companies have been omitted from our reply.

Yours faithfully,

For The Birmingham Small Arms Co., Ltd.,

(Sgd.) GEOFFREY D. BURTON,
Managing Director.

Replies by The Birmingham Small Arms Co., Ltd., to the Questionnaire of the Royal Commission on the Private Manufacture of and Trading in Arms.

July, 1935.

1. Proportion of total turnover attributable to arms and munitions of war:—

1934.	1933.	1932.	1931.	1930.
Per	Per	Per	Per	Per
cent.	cent.	cent.	cent.	cent.
3.02	8.05	5.13	8.95	6.21

2. Sub-division of the above:—

	1934.	1933.	1932.	1931.	1930.
	Per	Per	Per	Per	Per
	cent.	cent.	cent.	cent.	cent.
United Kingdom.	1.02	.93	1.48	1.85	1.36
British Empire	.66	.59	.58	1.21	2.34
Foreign Orders.	1.34	6.53	3.07	5.89	2.51

3. Estimated value of plant employed in the production of arms and munitions of war all of which is, and would be, redundant to the Company's other work. £300,000 covers buildings, plant, machinery, jigs, tools and fixings.

4. Declared profit of the Birmingham Small Arms Co., Ltd., as per balance sheet which includes dividends and the profits and losses of Subsidiary Companies.

1934.	1933.	Loss 1932.	Loss 1931.	1930.
£	£	£	£	£
127,550	245,532	688,647	112,944	242,276

Of the above the following were attributable to arms and munitions of war:—

Loss 1934.	1933.	Loss 1932.	Loss 1931.	1930.
£	£	£	£	£
8,035	46,543	15,970	2,061	10,365

In arriving at these figures no deduction has been made for interest on loan capital.

5. Average number of employees engaged in the production of arms and munitions of war:—

1934.	1933.	1932.	1931.	1930.
169	198	158	270	208

Other products.

1934.	1933.	1932.	1931.	1930.
4,738	3,974	3,568	3,703	4,505

6.

7.

8.

[Replies to these Questions not printed.]

9. All actual orders received for arms and munitions of war have developed from enquiries. The Company does not advertise or solicit orders for arms and munitions of war, but B.S.A. Guns, Ltd., advertise in the press appropriate to retail trade their peace-time products (sporting guns, target rifles, etc.).

6 February, 1936.]

THE BIRMINGHAM SMALL ARMS CO., LTD.

[Continued.]

3315. *Chairman*: Before you make your own statement, I would like to ask a question about your reply to Questions 6, 7 and 8. You claim that that should be treated as confidential, and the replies to these questions are not printed; but when I look at the replies to questions 7 and 8, I do not see any reason why you should not want them printed. No. 6, of course, deals with the expansion question; but in No. 7 you are asked about agreements, and you say you have only one agreement, and that is with an armament firm, the Soley Armament Co., Ltd.

Mr. Burton: Yes.

3316. *Chairman*: But as regards the Soley Armament Co.'s agreement which you refer to, this is an agreement with reference to selling surplus arms, is it not?

Mr. Burton: That is correct, yes.

3317. *Chairman*: I mean, it is only an agreement that you made with this company in order to dispose of government surplus arms?

Mr. Burton: That is correct, yes.

3318. *Chairman*: There is no reason why that should be treated as confidential, is there?

Mr. Burton: No, I do not really think there is. I am sorry; perhaps it was unnecessary.

3319. *Chairman*: It looks to me to be quite unimportant. Then, with regard to the other, No. 8, "Details of the firm's present holdings of the capital of other firms," your answer is: "All these companies are British," and then you state what they are, and they all are British, and have really no material bearing at all upon our Inquiry. Is there is any reason at all why they should not be published?

Mr. Burton: No, there is not, really.*

3320. *Chairman*: Now you wish to make some statement to us?

Mr. Burton: Yes, Sir. I have made a few copies. (Documents handed in.)

1. For some years before the War, the B.S.A. Company was making service rifles at a fairly steady rate, approximately 50,000 per annum.

2. When war broke out this enabled the company quickly to increase its production, and during the War 146,000 Lewis guns and 1,600,000 rifles were manufactured. Our final capacity at the end of the War was 12,000 rifles, an equal volume in spare parts, and 3,000 machine guns per week.

3. After the War no orders were obtainable and owing to lack of funds the company had to close down its experimental and development departments and dispense largely with the services of its key men skilled in rifle and machine gun production. This condition has obtained more or less the same ever since, except that in 1930 an agreement was come to with the War Office that in consideration of our maintaining our rifle manufacturing plant, we could act as sole selling agents for government surplus rifles and Lewis guns. This agreement is now terminating and has entirely failed in its object on account of the various embargoes on the export of arms. The total sum received due to this contract has been negligible when compared with the cost of maintaining our factory.

4. We have recently received an order for S.M.L.E. Mark III rifles. To execute this order we have so far engaged a number of men, and out of these over two-thirds have left or been discharged as not capable of being trained, and of those remaining with us many are not yet giving satisfactory results. I am trying to point out the difficulty we have in getting men for this work. One reason for men leaving is that when they are taken on and find that there is no sign of continuity of work and that the type of work is strange to them, they make no real effort to learn and eventually give up in disgust

and get employment elsewhere. A typical instance is of a youth who was employed for a period and should have earned £24 on piece work to make his guaranteed day time. His actual earnings were £15 2s. and the company had to make him a present of £8 18s. Another should have earned £25; his earnings were £10 4s. and the company had to find the difference, namely, £14 16s. Both then left our employ.

3321. *Sir Thomas Allen*: Over what period would that be?

Mr. Burton: About three months, I think. I could not give you the exact period. I think it was about ten or twelve weeks. I could find that out accurately if you want it.

This implies not only wastage of money, but also quantities of spoiled material, and the training period lost. If there was evidence of continuity of employment we should soon get men skilled at their work and apprentices who would be prepared to learn the trade; and in this way build up a nucleus which could quickly expand in time of emergency.

5. If it is thought necessary to be ready for an emergency it is clearly desirable to have a factory in an area like Birmingham where a plentiful supply of trainable skilled labour is available. The manufacture of small arms necessitates the employment of very highly skilled men. We believe that outside Great Britain, the policy of government support for private manufacturers has been general, and we further believe that had we not been crippled by lack of support there would have been no necessity for the British government to adopt and purchase foreign makes of small arms as they are doing. The policy of the government since the War has, to some degree, indicated the effect of abandoning the private manufacture of small arms. Instead of development in this country keeping pace with, or being ahead of, foreign countries, it has dropped behind to such an extent that foreign guns and foreign designs of guns have had to be purchased. We believe that had the foreign companies not been operating for many years with the full support of their respective governments, the guns recently adopted in this country would not have been available.

6. It is a generally accepted principle in any industry that a good export business can only be built up on a sound home trade. This certainly applies to guns. If the B.S.A. Company had received the support of the British government they would naturally be in a better position to compete in other markets because their costs would be reduced. Therefore, instead of factories like—then I give the various names—being busy as they have been for a number of years while B.S.A. stood practically idle, the B.S.A. Company would be working to capacity and in an emergency would immediately be able to switch entirely on to home requirements.

7. The lack of interest by the British government in arms development since the War has resulted in the impression gaining ground that other countries are better able to design small arms than this country. We believe there is evidence to show the reverse, and there are brains in this country very well able to deal with the technical problems involved in small arms design should they receive encouragement.

8. Many of the points above mentioned could be overcome by the government taking over our small arms factory and personnel, but we believe that the difference between a small arms factory operated by the government, and a similar factory trying to earn profits for shareholders, is very definite, and that the company trying to pay a return on capital invested will have greater incentive and urge to ingenuity, which will result in greater progress. Further, when there is little

6 February, 1936.]

THE BIRMINGHAM SMALL ARMS CO., LTD.

[Continued.]

or no demand for arms, at any rate part of the cost of maintaining the organisation can be carried by the company. With a private concern manufacturing other products besides arms, part of the fixed charges can be borne by the other products instead of them all being carried by the arms department.

There is one other little item which I would like to mention, if I may. I notice in the evidence of one gentleman with regard to prices, he mentioned the B.S.A. Company, comparing costs, and I would like to make this point, if I may, comparing with the evidence on page 272*—the price given of £3 3s. 2d. per rifle at Enfield as against £4 3s. 9d. per rifle at the B.S.A.

3322. *Chairman*: Is this in Dr. Addison's evidence?

Mr. Burton: No, in Mr. Baker's. He gave those figures. I only wish to point out that those figures were not comparable, as the prices given for rifles made at the government factories do not include all the items of costs. The figure that he was referring to was for many years back, but at that time, in answer to a question in Parliament, it was stated that the costs at Enfield did not include rates, taxes and other fixed charges, and that if these charges were added, the costs of the rifles made there, and that of the rifles made by the trade, would probably be almost identical. Our view is that in these days of accurate audit, costs can be and are rigidly checked, and any inefficiencies brought to light and rectified. We have freely at our disposal every method adopted by the Royal Small Arms Factory at Enfield, and vice versa. So we get the benefit of that. That is all, Mr. Chairman.

3323. *Chairman*: With regard to paragraph 6 of your statement, you mentioned factories that are busy. Where are they situated?

Mr. Burton: I would rather leave those names out. I do not know whether I ought to have put them in; that is why I did not read them out; but one is in Czecho-slovakia, one is in America—

3324. *Chairman*: There is no reason why you should not read them out.

Mr. Burton: Well, Hotchkiss is in France, Bren is in Czecho-slovakia, and Colt is in America.

3325. *Chairman*: Is Bren the manufacturer of the gun that has been adopted?

Mr. Burton: Yes.

3326. *Chairman*: That is the gun that has been adopted recently, is it?

Mr. Burton: Yes.

3327. *Chairman*: And is that what you are referring to when you speak of the government buying arms from abroad?

Mr. Burton: That is right; and I believe there are others.

Secretary: They do not actually buy Bren guns from abroad?

Mr. Burton: They have the right to manufacture, and they also buy a certain number of guns, I dare say; but it is really the right to manufacture.

3328. *Chairman*: I see—licence.

Mr. Burton: Yes.

3329. *Sir Thomas Allen*: Did you ever make the gun that Bren is superseding?

Mr. Burton: We made the Lewis gun, yes. We made almost the whole number, I think.

Chairman: There is nothing else that I want to ask.

3330. *Dame Rachel Crowdy*: At what date did you enter into your agreement with the Solely Armament Co.?

Mr. Burton: 1930.

3331. *Dame Rachel Crowdy*: Were they a new organisation at the time, or had they been in existence ever since the War?

Mr. Burton: They were a new organisation.

3332. *Sir Kenneth Lee*: A statement was made by Sir Alexander Roger on 13th November, 1935,

saying that owing to lack of orders it had been impossible for your company to carry out the necessary research work.

Mr. Burton: Yes, that is correct.

3333. *Sir Kenneth Lee*: Is that the reason why the progress has not been made?

Mr. Burton: I should say very largely.

3334. *Sir Kenneth Lee*: Is it true that the gun you were making cannot be made on a mass production basis?

Mr. Burton: The Lewis gun, are you referring to?

3335. *Sir Kenneth Lee*: No, the rifle—I meant the rifle, the Enfield rifle.

Mr. Burton: Well, it is difficult to know exactly what mass production means. I have a general idea, but it is rather difficult to define it. Do you mean only done by unskilled labour?

3336. *Sir Kenneth Lee*: Can it be easily duplicated?

Mr. Burton: No, in that sense I suppose it is not a mass-produced article; but no gun that I am aware of, whether it is Bren or any other, can be made without a very high percentage of skilled labour.

3337. *Chairman*: But the Bren gun is not a rifle, is it?

Mr. Burton: No, it is not.

3338. *Chairman*: We are speaking of rifles at the moment.

Mr. Burton: Yes. The same applies to rifles.

3339. *Chairman*: We were told that during the War the only rifle obtainable was one that necessarily had to be made by hand labour; whereas in the future there ought to be a rifle that could be produced by mass production. That is what Sir Kenneth is referring to, I think.

Mr. Burton: Well, I do not know of one yet. There may be one in the future, but the skill of human beings has not arrived at that stage yet. I was recently in America, which is, I suppose, the home of mass production, and I saw rifles being manufactured there, and their methods were almost identical with the methods used in the B.S.A. to-day.

3340. *Sir Kenneth Lee*: And that is universal, is it?

Mr. Burton: Well, they are not universal, but if there were better methods I think we should get to know about them.

3341. *Sir Kenneth Lee*: But if you had done your research work, you might have designed a rifle which could have been manufactured more easily?

Mr. Burton: Oh, yes. I do not say we should have reached the ideal, but each year we would find some improved method of doing some operation.

3342. *Sir Kenneth Lee*: But you have not been able to do anything owing to the conditions.

Mr. Burton: Well, practically nothing.

3343. *Mr. Spender*: Is there any particular reason for the government giving you orders for small arms for which there is no immediate use, and which may go out of date?

Mr. Burton: I do not think the government would order anything unless they wanted it for probable contingencies.

3344. *Mr. Spender*: But you suggest special orders.

Mr. Burton: Some work to enable a nucleus of men to be trained, in order to enable a company which is not subsidised in any way to carry some development overhead expenses in that way, which is non-productive.

3345. *Mr. Spender*: Supposing that method is adopted, would a subsidy meet your case as well as the method of special orders?

Mr. Burton: No, not solely. I think that is just the difficulty. Just a sum of money will keep our plant in existence, but it will not train our men.

3346. *Sir Philip Gibbs*: In your statement about becoming selling agents for government surplus rifles and Lewis guns, you say: "This agreement is now terminating and has entirely failed in its object on account of the embargo on the export of arms." The embargo to what countries?

* *Minutes of Evidence*, 10th Day, p. 272.

6 February, 1936.]

THE BIRMINGHAM SMALL ARMS CO., LTD.

[Continued.]

Mr. Burton: Well, China was one; certain countries in South America.

3347. *Sir Philip Gibbs*: You mean Paraguay and Bolivia?

Mr. Burton: Yes.

3348. *Sir Philip Gibbs*: Any other countries?

Mr. Burton: Lithuania.

3349. *Dame Rachel Crowdy*: The Chinese embargo only lasted a fortnight, did it not?

Mr. Burton: It lasted long enough so that we did not get the order.

3350. *Sir Philip Gibbs*: Then you have made an arrangement with the Soley firm, represented by Captain Ball, for surplus stock, have you not?

Mr. Burton: Yes.

3351. *Sir Philip Gibbs*: Is that still in existence?

Mr. Burton: Well, it is a collateral arrangement with the government one, so it is terminating also. It is in process of finishing off.

3352. *Sir Philip Gibbs*: So that the two things coincide?

Mr. Burton: Yes.

3353. *Sir Philip Gibbs*: Could you tell me any idea why you chose that particular firm?

Mr. Burton: Well, it was before my time. Captain Ball is here, sitting on my right. He represents the Soley Armament Company.

3354. *Sir Philip Gibbs*: I was trying to get your point of view.

Mr. Burton: We had no one, as I understand it, who was *au fait* with the American customers and the people who would buy these surplus rifles, and the government wanted to dispose of them.

3355. *Sir Philip Gibbs*: And was it by any government advice, or on credentials from the government, that you appointed Captain Ball?

Mr. Burton: No, certainly not; but I think they might have raised objections if they did not approve of him, or something like that; but we were left free to deal with the matter as we liked.

3356. *Sir Philip Gibbs*: And you happened to know that he was engaged in that type of business?

Mr. Burton: Yes, I think that is the case. It was before my time, actually. I was not there at the time.

3357. *Sir Philip Gibbs*: Now, with regard to this new machine gun which the government has adopted, is it a matter only of price, or is it a matter of superior design, in your opinion?

Mr. Burton: Well, I have not heard it yet. I imagine that the government must think it is a design better than any before, or else they would not have adopted it.

3358. *Sir Philip Gibbs*: It would not be governed by price considerations?

Mr. Burton: I should think that would be very secondary. I do not know.

Sir Philip Gibbs: I think that is all the questions I want to ask you. Thank you.

3359. *Sir Thomas Allen*: Just two questions only. Your statement is dated July, 1935, and you give the figures up to 1934. Have you any available for 1935?

Mr. Burton: Well, actually our year ends at the end of July of each year, so when we got these figures out we had not got the figures for the subsequent year, but they are available now. I do not think there has been much difference.

(The witness withdrew.)

Captain JOHN BALL, director, SOLEY ARMAMENT COMPANY, LIMITED, called and examined.

3371. *Chairman*: Now, the last company we want to inquire into to-day is the Soley Armament Company. This is Captain Ball. I have not any details about you, Captain Ball. Were you in the army?

Captain Ball: The Air Force.

3372. *Chairman*: Our Air Force.

Captain Ball: Yes.

3373. *Chairman*: For how long?

3360. *Sir Thomas Allen*: In your reply to our secretary's letter, you say that as a result of war experience the company was extremely apprehensive as to the supplies of steel for small arms, and that that led you to acquire the business of William Jessop & Sons, Ltd., and J. J. Saville & Co., Ltd. Would that be on account of a steel ring that made you apprehensive?

Mr. Burton: No. Again I am afraid it is before my time, but I was in the steel trade myself then, and there was a great shortage of steel at that time, and everybody believed that there was enormous prosperity going on and on, and everybody thought there was going to be a great shortage of steel.

3361. *Sir Thomas Allen*: That was the only ground upon which you were apprehensive?

Mr. Burton: Yes. I do not think it was anything to do with price.

3362. *Sir Thomas Allen*: Nothing to do with the ring preventing you getting supplies at all?

Mr. Burton: No. I do not think so. I am sure that would not be so.

3363. *Professor Gutteridge*: I take it that really what has put a difficulty in your way is the existence of this second-hand trade in rifles, is it not?

Mr. Burton: Well, if there had not been any rifles left over from the War, no doubt we should have had some orders to make up the normal wastage by the existing army.

3364. *Professor Gutteridge*: What has created the difficulty for you has been the disposal of these second-hand guns?

Mr. Burton: The fact that America made a great number of rifles.

3365. *Professor Gutteridge*: Do not you think there is a strong case for the suppression of this trade in used weapons from the national point of view on that ground alone?

Mr. Burton: Well, I do not know. They might be wanted in an emergency, might they not? 3366. *Professor Gutteridge*: I do not see any harm in their being put away in an armoury, but I am suggesting to you that it is an unwise thing to have a traffic in these second-hand weapons from the national point of view.

Mr. Burton: I do not know whether I am able to answer that very well. It is a matter of opinion, is it not?

3367. *Professor Gutteridge*: As a matter of fact, the world was flooded with second-hand weapons of all kinds just after the War.

Mr. Burton: Yes. I think that was so.

3368. *Professor Gutteridge*: I remember a period when one was offered bayonets and steel helmets.

Mr. Burton: Yes, of course one was.

3369. *Dame Rachel Crowdy*: Talking about the Bren gun just now, you said, if I understood you, that the government had both the right to manufacture and had also imported.

Mr. Burton: Well, I do not know; I am not quite sure about the importation. It was stated in Parliament that they had adopted the Bren gun.

3370. *Dame Rachel Crowdy*: Have you made any at all—your firm?

Mr. Burton: No.

Chairman: Thank you. That is all, unless there is anything you want to say to us.

Mr. Burton: Thank you, Sir.

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

Captain Ball: It would be about 1925.
 3377. *Chairman:* And did you get from the government a sole agency?

Captain Ball: Oh, no.

3378. *Chairman:* What was your position?

Captain Ball: Our position with regard to the government was, in connection with the B.S.A., that the B.S.A. had the sole selling rights of its arms, and we had the selling rights from the B.S.A.

3379. *Chairman:* You took it from them?

Captain Ball: We took it from them.

3380. *Chairman:* Had they an exclusive right?

Captain Ball: Yes.

3381. *Chairman:* They had an exclusive agency?

Captain Ball: Yes, in place of a subsidy.

3382. *Chairman:* The last witness told us about that, that they had the exclusive agency given to them.

Captain Ball: In place of a subsidy, yes.

3383. *Chairman:* And you acted for them?

Captain Ball: Yes.

3384. *Chairman:* Had you a free hand to get orders and to arrange the despatch of the guns, and all the rest of it?

Captain Ball: Oh, yes.

3385. *Chairman:* And to fix the prices?

Captain Ball: Subject, of course, to the issue of the necessary export licences; but with regard to the acquirement of orders I had a free hand.

3386. *Chairman:* And fixed the prices?

Captain Ball: Yes, within limits set down by the B.S.A. and the War Office.

3387. *Chairman:* Did they fix a limit?

Captain Ball: They fixed the minimum prices.

3388. *Chairman:* The government?

Captain Ball: The prices that I should have to pay, yes.

3389. *Chairman:* And then you made what profit you could, was that it?

Captain Ball: I made whatever I could get.

3390. *Chairman:* You were not working on commission, or anything?

Captain Ball: Oh, no.

3391. *Chairman:* What profit you could get?

Captain Ball: Yes.

3392. *Sir Philip Gibbs:* Did you buy them from the government?

Captain Ball: Well, we do not exactly buy them. If we receive an order, we pay the government and issue them on an export licence.

3393. *Professor Gutteridge:* You are a broker really, are you not?

Captain Ball: Just a broker.

3394. *Sir Philip Gibbs:* You do not buy them in advance?

Captain Ball: Oh, no.

3395. *Chairman:* And then you had to arrange for the despatch.

Captain Ball: That is so.

3396. *Chairman:* Sometimes it turned out, did it, that the intending purchaser could not get the arms by the direct route? That was so, was it?

Captain Ball: That was so.

3397. *Chairman:* So you had to arrange a devious route?

Captain Ball: We never arranged a devious route. We have never tried to arrange a devious route.

3398. *Chairman:* Never tried?

Captain Ball: No.

3399. *Chairman:* Well, I am not sure about that. I think your letters seem to show that you had tried and succeeded.

Captain Ball: Oh, no, Sir. We said that if the American government liked to buy the arms, they could do then what they liked with them; the responsibility was on their shoulders; so far as we were concerned, we could do nothing.

3400. *Chairman:* Yes; but that was a devious way, was it not, by introducing somebody else who could pass them on without difficulty?

Captain Ball: If the American government agreed, it was nothing to do with us.

3401. *Chairman:* But if you had told the English government when you asked for the licence that that was what you were going to do, you would not have got the licence?

Captain Ball: Well, we did not in fact, because that is exactly what we did do—we did inform the British government.

3402. *Chairman:* And did not the guns go at all?

Captain Ball: The British government knows perfectly well everything we do. We do not get a licence otherwise.

3403. *Sir Thomas Allen:* Would you explain to us a little more explicitly what is the relation, say, between you and the B.S.A. and the War Office? How does it pan out?

Captain Ball: Well, the B.S.A. are the agents for the War Office, and we are the agents for the B.S.A.

Secretary: For the sale of what?

Captain Ball: For the sale of the War Office surplus rifles.

3404. *Sir Thomas Allen:* Then you being the agents for the B.S.A., you immediately come in contact with the War Office?

Captain Ball: Yes.

3405. *Sir Thomas Allen:* And not the B.S.A.

Captain Ball: Not the B.S.A., no.

3406. *Sir Philip Gibbs:* But you are a private firm, are you not?

Captain Ball: Yes.

3407. *Sir Philip Gibbs:* Quite independent of the B.S.A.?

Captain Ball: Oh, quite independent of the B.S.A.

3408. *Sir Philip Gibbs:* And you deal in arms quite irrespective of War Office stock?

Captain Ball: Yes, quite so.

3409. *Chairman:* I see in your letter that you write to our secretary, in answer to our request for information, you say: "Maybe in our letters we were not particularly careful in our choice of expression, for the letters were of a matey variety."

Captain Ball: Yes.

Chairman: But you adopted the same form of language towards us, did you not, because in the latter part of your letter you say: "In spite of all this, most portions of the U.S.A. press and a few of the British publications suggested that we were as devoid of morals as the Italian organ-grinder's monkey." Is that a type of your matey conversation? Well, I have nothing more to ask you. Very well.

3410. *Dame Rachel Crowdy:* Captain Ball, I should like very much to know how you first got into the business. Could you tell us that, or what your special qualifications were? Had you travelled a great deal, or had you affiliations in other countries? Tell us anything you can, will you?

Captain Ball: Having travelled a great deal, and having had connections in various countries.

3411. *Dame Rachel Crowdy:* As what? In what respect?

Captain Ball: With regard to small arms.

3412. *Dame Rachel Crowdy:* During the War, or after?

Captain Ball: Before the War and during the War.

3413. *Professor Gutteridge:* Were you a stores officer in the Flying Corps then?

Captain Ball: Yes—no, technical.

3414. *Professor Gutteridge:* Not a pilot?

Captain Ball: Yes, a pilot also, but mainly technical.

Chairman: I think we had better ask questions in turn. Dame Rachel Crowdy is in charge of the proceedings at the moment.

Professor Gutteridge: I beg your pardon.

3415. *Dame Rachel Crowdy:* If you could tell us a little more of your back experience I should be very grateful. Were you in any way connected with armament firms before you took up this business in different countries?

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

Captain Ball: No, in no way.

3416. *Dame Rachel Crowdy:* What made you see the opportunity in this trade?

Captain Ball: Well, that is very difficult to reply to. I mean, I am an expert in small arms; they have been a hobby of mine all my life, and naturally it is the line of least resistance.

3417. *Dame Rachel Crowdy:* And the greatest market?

Captain Ball: Yes.

3418. *Dame Rachel Crowdy:* Now could you tell us, have you any agents in any part of the world?

Captain Ball: Oh, yes—well, not exactly agents, but I have connections, you see.

3419. *Dame Rachel Crowdy:* Could you tell us something of those connections. I should like to know the agents if you have any, where you have them, and any companies with which you are affiliated in different parts of the world.

Captain Ball: We are not affiliated with any companies at all at the present time.

3420. *Dame Rachel Crowdy:* How do you interpret the word "affiliation?"

Captain Ball: Not having a financial and working connection with them.

3421. *Dame Rachel Crowdy:* Have you no relationship with American firms, for example?

Captain Ball: None whatever at the present time. The arrangement we made with the American firms was for six months only. It was a purely tentative arrangement.

3422. *Dame Rachel Crowdy:* Your arrangement with Miranda is at an end, then?

Captain Ball: Completely.

3423. *Dame Rachel Crowdy:* Could you tell us, then, about your agencies and your agents, in what parts of the world you have them?

Captain Ball: We have an agency in Liege, Berlin—that is the lot at the present time.

3424. *Dame Rachel Crowdy:* None in the Far East?

Captain Ball: No.

3425. *Dame Rachel Crowdy:* None in South or Central American countries?

Captain Ball: No.

3426. *Dame Rachel Crowdy:* When you speak of your agency in Liege, are you speaking of your own factory in Liege, because you have a factory, have you not?

Captain Ball: Speaking of the factory we have there?

3427. *Dame Rachel Crowdy:* It is actually your factory, not merely your agency?

Captain Ball: Yes; but that factory exists for the conversion of rifles from one calibre to another. We take an unsaleable rifle and make it into a saleable one.

3428. *Dame Rachel Crowdy:* Have you factories anywhere else?

Captain Ball: None.

3429. *Dame Rachel Crowdy:* None at all?

Captain Ball: No.

3430. *Dame Rachel Crowdy:* In any part of the world?

Captain Ball: No, none.

3431. *Dame Rachel Crowdy:* I am very interested in reading through some of these letters to see the places you ship from. You do a good deal of shipping away from English ports, do you not?

Captain Ball: Oh, yes.

3432. *Dame Rachel Crowdy:* Could you tell us why? *Captain Ball:* For the simple reason that the material comes from the continent.

3433. *Dame Rachel Crowdy:* The material you are shipping comes from the continent?

Captain Ball: The material we are shipping comes from the continent. If it is continental material, if we are selling mauser rifles on the continent, we ship it from continental ports. There is no necessity to bring them to England.

3434. *Dame Rachel Crowdy:* Your shipment, for example, in the *Black Gull* was from Antwerp?

Captain Ball: To where?

3435. *Dame Rachel Crowdy:* Well, I think, as far as I can remember—was that your shipment to Bolivia? I am not sure. I do not think it was.

Captain Ball: No. We have never shipped a single rifle to Bolivia.

3436. *Dame Rachel Crowdy:* No. You did some shipping from Antwerp; I remember very definitely. I think I can find out without much difficulty.

Captain Ball: To what destination?

3437. *Dame Rachel Crowdy:* No; it was your shipment to America that was from Antwerp. There is a letter from you of February 3, 1934.

Captain Ball: But that was with regard to the samples that went to Miranda—a sample consignment of rifles.

3438. *Dame Rachel Crowdy:* Why did they go from Antwerp particularly? Were they born and made in that part of the world?

Captain Ball: No, the rifles had been reconditioned in Liege, and Antwerp being the nearest port, they were sent from Antwerp.

3439. *Dame Rachel Crowdy:* The rifles were presumably bought on the continent and re-fashioned at Liege.

Captain Ball: Yes.

3440. *Dame Rachel Crowdy:* I have been reading through some of these letters. You have probably got Part 3, have you not, of the proceedings of the American Inquiry?

Captain Ball: I have not.

3441. *Dame Rachel Crowdy:* I am sure that someone could give it to you. (Document handed to witness.) The letters I am going to quote from will be from about page 674, roughly, to page 685. The way in which this transaction is carried out, if one understands it rightly, is described in Exhibit 260, which you will find on page 678. Have you got that?

Captain Ball: Yes.

3442. *Dame Rachel Crowdy:* I will read it. Half-way down, on page 680, you are writing to the American Arms Corporation, and you say:

As you are no doubt aware, China consumes a vast quantity of small arms per year, and they have bought large quantities of rifles from us, mainly Mausers (over 100,000 in 1931/32) but have slacked off lately owing to the loss of Manchuria, and the shortage of ready money in the south—i.e., Canton and Nanking. In spite of all the dreams of the idealists, who imagine that homo sapiens is filled with honor, justice, love, and self-sacrifice, Japan is going to take a still larger slice of China, and comparatively shortly, while the getting is good. To place herself in a favorable position, Japan must either buy over the Soviet or fight them—and Japan will do one or the other, before attending to some more of China.

Such a move on Japan's part would seriously affect the U.S. interests in China, and we think that the U.S. would under the above circumstances support the Chinese, supply them with arms, etc.

In such an eventuality, something might be done with the big stocks of rifles here, also M.G.s, and we think it might be very advisable for you to approach the U.S. Dept. for Foreign Affairs and the War Dept., and hand them a list of what stocks there are over here, informing the Depts. at the same time that you are the sole representative for the U.S.A.

Well, one of the things we have tried to find out in this Inquiry is whether preparation is preached by any of the firms connected either with the manufacture or with the sale of arms; and certainly, as I read this letter, you are definitely putting into the mind of the United States that they had better buy arms or obtain arms if possible from us over here in order that they may support the Chinese, and presumably, to follow that up rather more, in order that China may oppose Japan in some way or another. That seems to me to come very much within the category of preparation.

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

Captain Ball: Yes, I quite agree.

3443. *Dame Rachel Crowdy*: And I should like you to make any comment you care to on that.

Captain Ball: Well, the only comment I have to make is that I should call it intelligent anticipation on my part.

3444. *Dame Rachel Crowdy*: Yes; I think from your business point of view it probably is; but I wonder whether it shows anything else as well.

Captain Ball: I have no other point of view.

3445. *Chairman*: He says he has no other point of view.

Captain Ball: In dealing with arms, I have no other point of view.

3446. *Dame Rachel Crowdy*: Well, that is very courageous of you.

This is only our suggestion to you, and you may possibly have other ideas of your own as to how such a matter should be handled—for instance, it might be better to bring the stocks to the notice only of some of the "big business" gentlemen, and leave any possible wangles to them, for they even might see quicker possibilities in such a stock.

Then you add a sentence with which I quite agree,

Nothing would surprise us . . . and continue . . . but bear in mind that the world's stocks of small arms have shrunk very much during the last three years, and we certainly think that our stock is the only one left of any importance.

Why did you feel that you could not get rid of these rifles? If you wanted to get rid of them, why could not you get them yourself straight to China? Why did you have to press on your American friends to—?

Captain Ball: Because the Chinese government, at the time, had not the necessary finance to pay for them.

3447. *Dame Rachel Crowdy*: And it was better for the United States to stand the loss of that than your firm?

Captain Ball: Well, why not, Madam? Certainly. We were not going to do it.

3448. *Dame Rachel Crowdy*: Then you will also find, on page 684, I think, an answer from Mr. Miranda to a letter of yours. Your letter is dated 6th February, 1934, and he says to you:

Your remarks anent greasing the wheels that make the deals go around are very true and we fully appreciate that very often oil must be added to your quotations. In this connection will you make it a point to always quote us your prices net to us c.i.f. New York unless we specifically make a different request.

Well, that is a definite acceptance of the fact that whatever other firms tell us, palm-greasing is something you recognise.

Captain Ball: Oh, most certainly.

3449. *Dame Rachel Crowdy*: Completely, in your business?

Captain Ball: Yes.

3450. *Sir Thomas Allen*: Did you say "certainly"?

Captain Ball: "Most certainly." The people are not going to do anything for nothing.

3451. *Sir Thomas Allen*: One would like to know; that is all.

Dame Rachel Crowdy: Now, in the correspondence between yourself and this American firm—I think you are no longer connected in any way, you tell us—there is a great deal of talk about supplying the Bolivian government with this, that and the other, and if I can find it I think there is one letter where you say—yes, it is an earlier letter, the letter No. 260 on page 680. You say:

We have, of course, heard from several sources that Bolivia wants A.A. guns quickly; but we do not think for a moment that a shipment or sale to Bolivia could be made direct, while that country is at war. If, however, an American ornament firm of some standing bought the guns, for eventual re-sale, things might be easier—or if

the Colombian government, who are not at war, bought the guns, they could no doubt have them.

Is not that a very definite proposal, as our Chairman said just now, to evade our own Board of Trade regulations, our export licence?

Captain Ball: Not a bit. These guns would probably come from the continent. There is no difficulty at all in shipping the guns from the continent; they had no export licence system there.

3452. *Dame Rachel Crowdy*: But you do not object to the British guns going to countries when the British government is enforcing an embargo on export to that country . . .

Captain Ball: Most certainly not.

3453. *Dame Rachel Crowdy*: . . . as long as it does not go direct from your firm?

Captain Ball: As long as it does not go direct from this country. If they are British guns in the possession of continental people, of which there are any amount, we have not the slightest objection, because we know very well those guns did not leave this country with the consent of the British government. That is the point. It is a matter of policy, Madam.

3454. *Dame Rachel Crowdy*: It seems to me to go rather beyond policy; but that I think is for discussion.

Captain Ball: At the present time the British government has refused to allow the export of British rifles to Abyssinia—that is, government-owned arms from the surplus stocks—in spite of the fact that very big orders have been placed; but there are on the continent very large stocks of British rifles and British guns that were left in the various countries after the War, in Italy, for instance, and in France and Belgium, and there is nothing to prevent those British rifles going to Abyssinia at the present time.

3455. *Dame Rachel Crowdy*: Then your theory really is, Captain Ball, that it is wise to keep within the letter of the law, but that the spirit of the law is as nothing.

Captain Ball: Quite.

3456. *Dame Rachel Crowdy*: You are very clear as to what you feel about these things, because I see that at the time this correspondence is dated—

Captain Ball: The only thing that the British government is concerned with is the letter of the law, in so much that they cannot prevent the shipment of British rifles from other countries to any of the countries under an embargo. They cannot prevent it. How can they prevent it?

3457. *Dame Rachel Crowdy*: I am glad to say I do not think it is the only thing with which the British people are concerned; but I do not propose to enter into an argument on that. I see that the time when this Bolivian correspondence is going on is the time that we were imposing an embargo.

Captain Ball: On Bolivia?

3458. *Dame Rachel Crowdy*: On Bolivia, yes. Then I see again there is a good deal of exporting of arms to China. At that time we had no embargo; as I mentioned just now the embargo was a very short one, only a few weeks, applying both to China and Japan; but at the same time it was a moment when China and Japan were very much as they are now, at each other's throats, and I should like to know if at that time any of your arms supplies were reaching Japan. Do you know; can you tell us?

Captain Ball: None at all.

3459. *Dame Rachel Crowdy*: Nothing at all?

Captain Ball: None at all.

3460. *Dame Rachel Crowdy*: Then to end this I should like you to turn to page 685, that is Exhibit 263. You will find it relates to arms supplied to Cuba. Now it is not a letter to you or a letter from you, but the previous letter to you from Miranda does throw some light on it, I think. In the previous letter Miranda says:

With reference to the International Ordnance and Instrument Company about which you write

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

us in your letter of February 9th: We know this company very well and we know their managing director, Mr. Figuerola, who, at this time is abroad. They have close connections in Cuba and at times are entrusted with orders from the Cuban Government. We have recently finished a contract with them for artillery ammunition and are very well acquainted with them; therefore we shall pursue your negotiations with them on the subject of revolvers without undue delay.

Therefore I presume that this next letter is rather a continuation; but the arms that are supplied, which I imagine come from you to the American firm and have gone on to Cuba, are being supplied to Colonel Batista.

Captain Ball: We have never supplied any arms to Cuba either direct or through Miranda, and the letter shown as Exhibit No. 263 is quite strange to us; it is the first time I have seen it. How it becomes attached to our correspondence on the other side I have not the faintest conception.

3461. Dame Rachel Crowdy: Do not you think because of your close connection with Miranda, and Miranda's close connection with Cuba?

Captain Ball: I do not think so, madam. This letter is completely strange to me, completely new to me. We have never seen it before.

3462. Dame Rachel Crowdy: In those circumstances, then, accepting what you say—

Captain Ball: It may have been attached to it as circumstantial evidence, but I can assure you we have never seen it and we have never sold anything to Cuba.

3463. Dame Rachel Crowdy: Would you turn back to No. 262 again, then? What does "your negotiations" mean? The letter is written to you. They have recently finished a contract with them for artillery ammunition and are very well acquainted with them; "therefore we shall pursue your negotiations with them"—and there is a mention of Cuba in this same paragraph, "on the subject of revolvers without undue delay". What does that mean?

Captain Ball: Which paragraph is that?

3464. Dame Rachel Crowdy: It is the sixth paragraph on page 684. Certainly an amateur onlooker like myself reading this letter would assume that there was at least a question of you supplying arms which could go on to Cuba.

Captain Ball: Yes, but the paragraph you refer to indicates a connection between the International Ordnance Company and Miranda, not with us.

3465. Dame Rachel Crowdy: Then what does "your negotiations" mean when the letter is addressed to you—"therefore we shall pursue your negotiations with them"—"them" being people who have close connections with Cuba.

Captain Ball: The International Ordnance & Instrument Company applied to us for certain material direct here in London. We said: "No; our representatives for the north of South America or Cuba are Miranda & Co.", and we referred them to Miranda and that is Miranda's reply.

3466. Dame Rachel Crowdy: And the negotiations were for what?

Captain Ball: They came to nothing.

3467. Dame Rachel Crowdy: But what were they for?

Captain Ball: They came to exactly nothing.

3468. Dame Rachel Crowdy: Can you tell us what those negotiations were for?

Captain Ball: Various material.

3469. Dame Rachel Crowdy: Arms of different kinds?

Captain Ball: Small arms; but it came to nothing. We referred them to Miranda.

3470. Dame Rachel Crowdy: Yes. I still do not understand that paragraph. I will not develop the subject, but I still do not think that that paragraph, we shall pursue your negotiations,—with these people in Cuba,—is very clear.

Captain Ball: In other words, we had interviews with the International Instrument Company which were continued by Miranda, and Miranda says in the paragraph, "We shall continue your negotiations".

3471. Dame Rachel Crowdy: . . . we shall pursue your negotiations with them on the subject of revolvers,—evidently revolvers for Cuba. I happen to be particularly interested because I was in those two Cuban revolutions at the time, and seeing that the next letters refers to Colonel Batista I wanted to know if you or Miranda were supplying revolvers and arms generally not only to Colonel Batista, who as far as I remember, was the corporal who became the President of Cuba for a short period of time, but at the same time to Manduel and Crochada and the various other people who were leading either presidential or revolutionary movements in Cuba; but you say that none of your arms have by any means got to Cuba.

Captain Ball: To the best of my knowledge and belief we have never sold a single arm to revolutionaries, and do not intend to either.

3472. Dame Rachel Crowdy: That is a very high principle, is it not?

Captain Ball: And we are quite capable of seeing that they do not get into the hands of revolutionaries, too—nobody more so.

3473. Dame Rachel Crowdy: I think that is all I have to ask, Mr. Chairman.

Captain Ball: Our business is conducted more and more, if I may say so, purely with governments or the official representatives of governments. Under no circumstances do we sell arms at any time to private individuals or to syndicates or to banks or to anyone else other than the authorised representatives of an established or recognised government, and it is impossible for anyone to prove otherwise. There have been all sorts of suggestions that we have heard with regard to our activities in that direction, but I can assure you that there is no truth in any of them.

3474. Dame Rachel Crowdy: That reminds me of a question I wanted to ask you. Can you give me the exact position that Miranda held vis-à-vis the State Department of the U.S.A.?

Captain Ball: Well, he is one of the American manufacturers who manufactures in small quantities for the American government and various other governments.

3475. Dame Rachel Crowdy: You would not call him officially the agent of the American government. Would the State Department agree with that?

Captain Ball: I think so; but he was a contractor to the American government.

3476. Dame Rachel Crowdy: But did you never sell to him, then, because you just said that you never sold to anyone but governments?

Captain Ball: We can only sell through government direct. If Miranda gives us an order for 50 rifles, Miranda has to produce an official order to us from the purchasing government, and before we get an export licence for them or before we accept the order we must see the official order from the purchasing government; so that in no circumstances can our material get into unofficial hands, because the first thing that happens if they do is that a complaint is made to the British government and my position and that of the B.S.A. vis-à-vis the British government would be in jeopardy. I should be foolish to do such a thing.

3477. Dame Rachel Crowdy: So that it merely means handing on the bricks from one government to another.

Captain Ball: Absolutely nothing else.

3478. Mr. Spender: I should like, if I may, to get a little closer to the facts about this company and your association with it. Are you a salaried representative of the Solely Armament Company?

Captain Ball: No, I am the Solely Armament Company.

3479. Chairman: Limited?

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

Captain Ball: Yes—by myself.

3480. *Mr. Spender:* Correct me if I am wrong in a minute, but the circumstances are that you, the Sole Armament Company, obtain from the Birmingham Small Arms Company the agency for the sale of these surplus rifles?

Captain Ball: Yes.

3481. *Mr. Spender:* Now that was approved by the War Office?

Captain Ball: It was not objected to by the War Office.

3482. *Mr. Spender:* And from that time you had dealings direct with the War Office?

Captain Ball: From that time direct, yes.

3483. *Mr. Spender:* Then substantially the War Office must have approved. Now you have got this reconditioning factory at Liege, and presumably you exported a considerable number of British rifles and other arms to Liege for reconditioning?

Captain Ball: Yes.

3484. *Mr. Spender:* Did you get licences for sending them to Liege?

Captain Ball: Yes, certainly.

3485. *Mr. Spender:* Then after that have you despatched from Liege both these rifles and mausers which you bought from other sources?

Captain Ball: From other sources, yes.

3486. *Mr. Spender:* And you despatched all those from Belgium without any licence?

Captain Ball: Oh, yes—we did not despatch the British rifles from Belgium without a licence. We part with no British rifles without the previous consent of the British government. There is a special term to that effect. If we take a thousand rifles to Liege for conversion to another calibre, we do not dispose of those rifles without the consent of the British Foreign Office—the previous consent—absolutely.

3487. *Mr. Spender:* Is that of your own free will?

Captain Ball: No, that is a condition imposed upon us by them that it would not pay us to break.

Secretary: Is it a condition of the licence?

Captain Ball: The usual Board of Trade export licence.

3488. *Chairman:* Have you got a general licence or do you get a particular licence?

Captain Ball: No, we get a special licence.

3489. *Chairman:* I mean containing the conditions and terms and everything.

Captain Ball: Containing the conditions under which the rifles are exported.

3490. *Mr. Spender:* Then, as I understand it, all the British rifles that went out of Liege went under British licence.

Captain Ball: Certainly.

3491. *Mr. Spender:* And all the other arms—mausers and others—went without any licence.

Captain Ball: They went without any licence then because Belgium at the time had no export licence system.

3492. *Mr. Spender:* Can you give us an idea of the proportion between the two things you were handling—the British licensed and the foreign?

Captain Ball: About one per thousand—one British rifle to a thousand mausers.

3493. *Mr. Spender:* Let me understand. The British rifles are one thousand to one?

Captain Ball: We exported one British rifle to every thousand mausers—probably less than that.

3494. *Mr. Spender:* Then you were really agents for the export of mausers largely, which you considered yourself free, as you were free, to export from Belgium without any licence at all?

Captain Ball: Oh, certainly.

3495. *Mr. Spender:* So for the greater part of your business you claim to be quite free of licence?

Captain Ball: At the time. Of course, Belgium has since introduced an export licence system and we are not free now.

3496. *Mr. Spender:* We have had from other companies statements of profit and loss. Have you any statement of profit and loss at the present time?

Captain Ball: Not at the present time. The alleged "profits" are mostly losses.

3497. *Mr. Spender:* We have heard from the Birmingham Small Arms Company that the trading results were disappointing; and they were disappointing to you?

Captain Ball: Equally so, because owing to the imposition of embargoes on export to the various destinations to which we could have sold arms from this country the British taxpayer has probably lost very nearly £2,000,000 in the last seven or eight years. That sum has been sacrificed to policy—and probably quite rightly so.

3498. *Mr. Spender:* You have no concern in policy?

Captain Ball: Certainly I am concerned in policy, where it affects my interest *vis-à-vis* the British rifles.

3499. *Mr. Spender:* With regard to British rifles; but you do not acknowledge any policy with regard to your export of the others?

Captain Ball: Provided it does not interfere with British policy.

3500. *Mr. Spender:* Would you consider, say, in exporting mausers, whether it conflicted with British policy?

Captain Ball: Most certainly I would, because that would affect my position *vis-à-vis* the British authorities at once.

3501. *Mr. Spender:* That is your motive?

Captain Ball: I have that motive.

3502. *Mr. Spender:* You do not claim any higher motive?

Captain Ball: None whatever.

3503. *Mr. Spender:* You speak in very sweeping terms about graft and palm-greasing. Do you suggest in dealing with all your customers it is necessary to do that?

Captain Ball: No, I do not, by any means, but with some of them it is essential; with others not.

3504. *Mr. Spender:* There is a sort of moral meridian?

Captain Ball: It is a matter of latitude and longitude, is it not?

3505. *Sir Kenneth Lee:* Are we to understand that you have no agency at all direct with the War Office?

Captain Ball: No, I have not.

3506. *Sir Kenneth Lee:* No agency?

Captain Ball: No agency direct with the War Office. I become an agent merely with regard to my association with the B.S.A.—in other words, I am as much an agent of the War Office as the B.S.A. The contract was handed to the B.S.A., who handed it on to me.

3507. *Sir Kenneth Lee:* You are not an agent for any other commodities direct with the War Office?

Captain Ball: No.

3508. *Secretary:* Have you been?

Captain Ball: For any other?

3509. *Secretary:* For any other article than rifles?

Captain Ball: We had a steel-helmet contract with them.

3510. *Dame Rachel Crowdy:* Have you ever at any time had a direct agency from the War Office for anything?

Captain Ball: No.

3511. *Secretary:* Not for anything at all?

Captain Ball: No, except for steel helmets.

3512. *Secretary:* Hotchkiss guns?

Captain Ball: But not with regard to rifles.

3513. *Secretary:* Or Hotchkiss guns?

Captain Ball: No. We had an agreement with them with regard to Hotchkiss guns but that also came to nothing, owing to the imposition of embargoes. We paid £2,350 for the selling rights of the Hotchkiss gun and we never sold a gun. We were precluded from selling them by the reimposition of embargoes. We could have sold thousands of those guns at various times.

3514. *Secretary:* Has that agreement terminated?

Captain Ball: It has terminated.

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

3515. *Secretary*: When did it terminate?*Captain Ball*: The agreement terminated in December, 1933.3516. *Sir Kenneth Lee*: Did you say that the Belgians had now instituted a licence system?*Captain Ball*: The Belgian government has a licence system at present. It has a licence system instituted at the present time; probably not quite so stringent as ours, but nevertheless efficient, which it did not have before.3517. *Sir Kenneth Lee*: Is it at all effective?*Captain Ball*: That is a question the Belgian government could answer better than I can.3518. *Sir Kenneth Lee*: From your experience?*Captain Ball*: I should think it would be.3519. *Sir Kenneth Lee*: It has prevented you?*Captain Ball*: Do not forget that anybody who violated it who was living in Belgium would cease to live in Belgium.3520. *Dame Rachel Crowley*: Perhaps you could evade it without violating it?*Captain Ball*: Can it be evaded without your being found out? Madam, it is not possible. You are always found out at the finish.3521. *Sir Philip Gibbs*: Were you in existence as a company before your connection with the B.S.A.?*Captain Ball*: Oh, yes.3522. *Sir Philip Gibbs*: For how long?*Captain Ball*: Since about 1927, I think.3523. *Sir Philip Gibbs*: What were you doing before your connection with the B.S.A.?*Captain Ball*: I was engaged in selling continental rifles, mausers.3524. *Sir Philip Gibbs*: Nothing from this country?*Captain Ball*: Nothing from this country.3525. *Sir Philip Gibbs*: But you had a fairly considerable business on the continent?*Captain Ball*: A considerable one on the continent, yes.3526. *Sir Philip Gibbs*: Sufficient to attract the attention of our War Office perhaps?*Captain Ball*: I do not think so; no.3527. *Sir Philip Gibbs*: You had no dealings with the War Office until you actually joined the B.S.A.?*Captain Ball*: No. I think we had a few dealings with the War Office with regard to steel helmets, but not with regard to armaments.3528. *Sir Philip Gibbs*: May I ask you what you were doing generally between 1918 and 1928, what was your particular business?*Captain Ball*: I was acting as a broker for the sale of arms.3529. *Sir Philip Gibbs*: Abroad?*Captain Ball*: Yes.3530. *Sir Philip Gibbs*: At that time, when Europe and the world generally was in a very turbulent state, with revolutions breaking out in this country and the other, did you find that your markets were good?*Captain Ball*: Unfortunately they were not very good, owing to the non-existence of the necessary finance. It is all a question of money. The desire for the arms was there, but there was no money to pay for them.3531. *Sir Philip Gibbs*: But you were actually doing business?*Captain Ball*: We were attempting to do business.3532. *Sir Philip Gibbs*: You were doing enough to carry on?*Captain Ball*: We were not making a profit. 3533. *Sir Philip Gibbs*: May I ask you this: In those years before you joined the B.S.A. Company who were your best customers?*Captain Ball*: Probably the Latvian government.3534. *Sir Philip Gibbs*: Poland?*Captain Ball*: None.3535. *Sir Philip Gibbs*: Russia?*Captain Ball*: None.3536. *Sir Philip Gibbs*: There is one sense of mystery in my mind which I am sure you will be

able to clear up, as to how you get your stocks of rifles and other munitions of war on the continent. For instance, you have told us—and it is rather surprising—that your continental trade is as one thousand to one.

Captain Ball: Yes.3537. *Sir Philip Gibbs*: How do you get those rifles? What is your method of obtaining them?*Captain Ball*: The only way the rifles can be obtained is by purchasing them as surplus from other governments.3538. *Sir Philip Gibbs*: They are actually in the hands of governments?*Captain Ball*: They are in some cases; in other cases there are governments who are quite ready to sell rifles to any Tom, Dick or Harry who will present them with the money. The majority do that. This is the only country with control.3539. *Sir Philip Gibbs*: Do you find it easy? If you obtain an order from any country in the world you can obtain stocks on the continent?*Captain Ball*: Yes.3540. *Sir Philip Gibbs*: I imagine in most cases that would be through agents, or what I should call middlemen.*Captain Ball*: Yes.3541. *Sir Philip Gibbs*: Would they hold those stocks in their own possession?*Captain Ball*: Some of them hold stocks themselves; other stocks are held by governments.3542. *Sir Philip Gibbs*: Do you find that certain governments are rather easy in delivery if an order comes through?*Captain Ball*: If the money comes through.3543. *Sir Philip Gibbs*: It amounts practically to the same thing. Could you tell us, for our own information, what governments are dealing with these second-hand rifles and so forth? Would France be one of them?*Captain Ball*: No.3544. *Sir Philip Gibbs*: Would Italy be one of them?*Captain Ball*: She might be at the present time but normally no.3545. *Sir Philip Gibbs*: You seem to get very great stocks of these rifles; from what countries mostly do you get them?*Captain Ball*: They are accumulations from various countries—countries like Greece, Bulgaria, Jugo-Slavia.3546. *Sir Philip Gibbs*: And do those stocks exist in those countries or have they been shifted?*Captain Ball*: The stocks usually exist in the country, but they are mainly on such a scale or of such a mixture that the country does not wish to use them.3547. *Sir Philip Gibbs*: There are no central depots?*Captain Ball*: There are no central depots.3548. *Sir Philip Gibbs*: Regarding those mauser rifles from Germany, to what customers do you sell them?*Captain Ball*: Only to governments.3549. *Sir Philip Gibbs*: What governments?*Captain Ball*: The Chinese government—Nanking.3550. *Sir Philip Gibbs*: And, of course, Canton as well?*Captain Ball*: No.3551. *Sir Philip Gibbs*: Never to Canton?*Captain Ball*: No, we have never sold any to the Cantonese government.3552. *Sir Philip Gibbs*: Do you think many of them have reached the Canton government?*Captain Ball*: Oh, yes, undoubtedly, but not from us.3553. *Sir Philip Gibbs*: By devious routes, but not through you?*Captain Ball*: Not through us, either direct or indirect.3554. *Sir Philip Gibbs*: How have they reached the Canton government?

6 February, 1936.]

Captain JOHN BAILL.

[Continued.]

Captain Baill: We are not the only pebble on the beach by any means.

3555. *Sir Philip Gibbs:* You have a lot of competitors?

Captain Baill: There are a number of continental dealers who have been occupied selling rifles for years. We are not monopolists. I wish we were.

3556. *Sir Philip Gibbs:* You feel that a great many of these continental second-hand rifles actually reach countries like China, Bolivia, Paraguay and others?

Captain Baill: There is no question about it, but not from us. The reason they did not come from us was because the Cantonese government would not produce the official importation order from the Nanking government, as required by the British government before arms can be shipped.

3557. *Sir Philip Gibbs:* It could be evaded by shipping to Hongkong?

Captain Baill: Possibly, but we never succeeded. If we attempted to evade any of the regulations laid down by the British government we should be in jeopardy at once. For the sake of temporary profit are we going to jeopardise our normal position? Certainly not. I have to live here. If I get at loggerheads with any of the British official departments what is going to happen?

3558. *Sir Philip Gibbs:* I should not have thought it would have mattered very much to you.

Captain Baill: Why not?

3559. *Sir Philip Gibbs:* Because your business here is only as one to a thousand.

Captain Baill: I quite agree, but that one is worth looking after.

3560. *Sir Philip Gibbs:* It is worth while?

Captain Baill: Oh, yes, it is one at the present time, but it might be reversed in a few years' time.

3561. *Sir Philip Gibbs:* I would like to ask you how many applications you have made to the British government through the Board of Trade for licences which have been refused. I happen to know, but I was rather wondering whether you also knew.

Captain Baill: I could not tell you the exact figure—quite a lot of them.

3562. *Sir Philip Gibbs:* Have you applied for licences knowing that there was an embargo against the sale of goods to certain countries?

Captain Baill: No.

3563. *Sir Philip Gibbs:* You have not?

Captain Baill: No.

3564. *Sir Philip Gibbs:* Are you quite sure of that?

Captain Baill: Positive.

3565. *Sir Philip Gibbs:* Then how is it that those licences have been refused?

Captain Baill: It is not always possible for us to know the private policy of the British government without testing it out.

3566. *Sir Philip Gibbs:* But it is not really a private policy, because licences are only refused with regard to embargoes that have been made public in most cases.

Chairman: Oh, no; that is not correct. I think that they exercise their own discretion.

Captain Baill: They exercise their own discretion.

Chairman: Whether there is an embargo or whether there is not.

Professor Gutteridge: I thought it was made clear that no reasons were given.

Captain Baill: They never give reasons.

3567. *Sir Philip Gibbs:* There have been cases where an embargo has been publicly declared by this government.

Captain Baill: Yes.

3568. *Sir Philip Gibbs:* As against Italy and Abyssinia and Bolivia and Paraguay.

Captain Baill: Yes.

3569. *Sir Philip Gibbs:* Can you assure me that you have not applied for licences to those countries?

Captain Baill: Not since we were aware that the embargo existed. From the moment we know that an embargo exists we will not waste our time in applying for a licence.

3570. *Sir Philip Gibbs:* Do you read the newspapers a good deal?

Captain Baill: Not very often.

3571. *Sir Philip Gibbs:* So you were probably unaware that the *Daily Express* and the *Daily Mail* had published the fact that there was an embargo against Paraguay and Bolivia.

Captain Baill: I do not read either of those papers. I would not be contaminated.

Chairman: I think we are travelling rather wide, *Sir Philip*.

Sir Philip Gibbs: Yes, I think we are.

3572. *Sir Thomas Allen:* Did I understand you to say that large quantities of British rifles were stocked in various countries in Europe?

Captain Baill: Yes.

3573. *Sir Thomas Allen:* On whose account are they stocked?

Captain Baill: They are in the hands of various governments.

3574. *Sir Thomas Allen:* The British government?

Captain Baill: No, they are in the hands of foreign governments.

3575. *Sir Thomas Allen:* I am speaking now of British stocks.

Captain Baill: There are stocks that were made for use by the British army, that were either conceded, or lent, or given to other powers during the world war. This country abandoned 50,000 new rifles in Italy when the War finished, 50,000 rifles that had been paid for by the British government were abandoned in Italy by the British government.

3576. *Sir Thomas Allen:* And they are at the disposal of the British government?

Captain Baill: No; they were disposed of by the Italian government.

3577. *Sir Thomas Allen:* Outside Italy?

Captain Baill: Yes, they are outside Italy now, but they were sold by the Italian government to another power.

3578. *Sir Thomas Allen:* Have you at any time sold any of those?

Captain Baill: I beg your pardon.

3579. *Sir Thomas Allen:* Are any British stocks on the continent at your disposal?

Captain Baill: There are stocks of British rifles at our disposal; we can buy them if we go up with the money.

3580. *Sir Thomas Allen:* You can draw upon those?

Captain Baill: We can draw if we like to pay for them.

3581. *Sir Thomas Allen:* Without going to England?

Captain Baill: Yes.

3582. *Professor Gutteridge:* Have you had any dealings with Hungary?

Captain Baill: None. It is on the prohibited list, under the Treaty of Versailles.

3583. *Professor Gutteridge:* You have had no dealings with them?

Captain Baill: None.

3584. *Professor Gutteridge:* I want to be clear about one thing. Hotchkiss guns were mentioned and I think you said you had at one time a direct agreement with the War Office with regard to those guns.

Captain Baill: Yes.

3585. *Professor Gutteridge:* Is that agreement still continuing?

Captain Baill: It has been renewed in another form. It was renewed in January, until next June.

3586. *Professor Gutteridge:* You mean this January?

Captain Baill: It still exists and it continues. It is a means of offering me some sort of compensation for the payment of £2,350 that is money down the drain as far as I am concerned, because the War Office conceded to us the sole selling rights of this gun in return for that payment, and on every occasion when we attempted to sell them we were prevented from selling them. Whenever we were offered money with the order we were prevented from shipping them by the imposition of an embargo by the Board of Trade.

6 February, 1936.]

Captain JOHN BALL.

[Continued.]

3587. *Professor Gutteridge*: Those guns are in this country?

Captain Ball: They are in this country.

3588. *Professor Gutteridge*: Are the Americans engaged in this second-hand arms trade?

Captain Ball: Oh, yes.

3589. *Professor Gutteridge*: They had a large surplus stock?

Captain Ball: They had very large stocks. They had more than England.

3590. *Professor Gutteridge*: Is there very fierce competition in this trade of yours?

Captain Ball: Not very much.

3591. *Professor Gutteridge*: There are not very many dealers?

Captain Ball: Not very many.

3592. *Professor Gutteridge*: I suppose you are really what I should call a sub-broker in these transactions.

Captain Ball: Yes.

3593. *Professor Gutteridge*: You do not hold the stock yourself; you go round and get orders?

Captain Ball: If we get an order we run round and take it up.

3594. *Sir Philip Gibbs*: What port do you use for the shipment of your goods in Belgium from Liège?

Captain Ball: Antwerp, usually.

3595. *Sir Philip Gibbs*: And since the imposition of a licence system by the Belgian government do you use any other port—free port?

Captain Ball: No.

3596. *Sir Philip Gibbs*: They mostly go from Antwerp?

Captain Ball: Mostly from Antwerp.

3597. *Professor Gutteridge*: What about Hamburg?

Captain Ball: No.

Professor Gutteridge: Hamburg is a free port.

3598. *Dame Rachel Crowdy*: Do you ever ship any on consignment?

Captain Ball: We might ship half a dozen samples on consignment, but in quantities, no.

3599. *Chairman*: Is there a large stock of surplus still in this country undisposed of?

Captain Ball: A very large one.

Chairman: Thank you.

(The witness withdrew.)

(Adjourned.)

APPENDIX 1.

STATEMENT SUBMITTED BY MESSRS. IMPERIAL CHEMICAL INDUSTRIES LTD.

(See QQ. 3053—3068.)

The following Schedule contains particulars relating to all the companies mentioned in the diagram entitled "The Foreign Connections of Imperial Chemical Industries Ltd.", which was submitted to the Royal Commission by the Union of Democratic Control and reproduced as Figure 2b appended to the Minutes of Evidence, 7th and 8th Days. The schedule indicates the nature of the connection (if any) existing between each company and Messrs. Imperial Chemical Industries Ltd.

COMPANY.	PARTICULARS.
AUSTRALIA.	
Nobel Australasia Limited	Wholly owned subsidiary of Imperial Chemical Industries of Australia and New Zealand in which I.C.I. owns 91.75 per cent. Manufacture and sale of mining explosives and kindred products; no military products.
Brunner Mond (Australia) Ltd.	Wholly owned subsidiary of Imperial Chemical Industries of Australia and New Zealand in which I.C.I. owns 91.75 per cent. Sales company; no military products.
Standard Ammonia Company of Sydney.	Wholly owned subsidiary of Imperial Chemical Industries of Australia and New Zealand in which I.C.I. owns 91.75 per cent. Ammonia manufacturing company; no military products.
AFRICA.	
African Explosives & Industries Ltd. ...	An associated company of Imperial Chemical Industries Ltd.; percentage holding 50 per cent. Manufacture and sale of mining explosives, fertilizers, insecticides, etc.; no military products.
Cape Explosives Works Ltd.	Non-operative; subsidiary to and wholly owned by African Explosives & Industries Ltd.
Magadi Soda Co. Ltd.	An associated company of Imperial Chemical Industries Ltd.; percentage holding 26.9 per cent. Manufacture and sale of alkali; no military products.
JAPAN.	
Brunner Mond (Japan) Ltd.	A subsidiary company of Imperial Chemical Industries Ltd.; percentage holding 99.28 per cent. Own sales organisation; not manufacturers.
CHINA.	
Brunner Mond (China)	A subsidiary company of Imperial Chemical Industries Ltd.; percentage holding 98.87 per cent. Name recently changed to I.C.I. (China). Sales company only; not manufacturers.

APPENDIX 1—continued.

COMPANY.	PARTICULARS.
INDIA.	
Brunner Mond (India) Ltd.	A subsidiary company of Imperial Chemical Industries Ltd.; percentage holding 99·68 per cent. Name recently changed to I.C.I. (India). Sales company only; not manufacturers.
AUSTRIA.	
Bickford & Company A. G.	A subsidiary company of Imperial Chemical Industries Ltd.; percentage holding 88·44 per cent. Manufacture and sale of safety fuse and lightning fasteners.
BELGIUM.	
Cartoucherie Belge	Non-existent.
Société Anonyme D'Arendonck	An investment of I.C.I. Percentage holding 29·89 per cent. Manufacture and sale of mining explosives; no military products.
Ancienne Fabrique de Meches de Vise	An investment of I.C.I. Percentage holding 41·66 per cent. Manufacture and sale of safety fuse for mining purposes only; no military products.
Barbier Group (Explosives)	We have an agreement with this company on industrial explosives. No military products.
Comptoir Belge des Engrais Azote	No direct connection. Members of International Nitrogen Cartel, of which I.C.I. also members.
Poudreries Reunies de Belgique	Fertilizers only. I.C.I. has an agreement with this company belonging to the Belgian group of explosives manufacturers regulating sales of industrial explosives. The company has recently undertaken the pelleting of T.N.T. for military purposes, but I.C.I. has no arrangement with them in this connection.
Société Anon. de Dynamite de Matagne	I.C.I. has an agreement with this company belonging to the Belgian group of explosives manufacturers regulating sales of industrial explosives.
Soc. Anon. de la Poudrerie de Carnelle	No military products. I.C.I. has an agreement with this company belonging to the Belgian group of explosives manufacturers regulating sales of industrial explosives. No military products.
Poudrerie Royale de Weteren Coopall	I.C.I. has an agreement with this company belonging to the Belgian group of explosives manufacturers regulating sales of industrial explosives. No military products.
Société Belge de la Dynamite Nobel	I.C.I. has an agreement with this company belonging to the Belgian group of explosives manufacturers regulating sales of industrial explosives. No military products.
Solvay et Cie	Commercial and technical agreement relating to manufacture and sale of alkali products; no military products.
SPAIN.	
Union Espanola de Explosivos	We have a patents and processes and sales agreement with this company covering mainly industrial products. The agreement excludes I.C.I. from selling military explosives and powders in Spanish territory, and vice versa. I.C.I. investment of 1 per cent.
CZECHOSLOVAKIA.	
Czechoslovak Explosives Ltd.	An I.C.I. investment of 32 per cent. Manufactures primarily industrial explosives and some military explosives.
Nobel Bickford A.G. Trencin	An I.C.I. investment of 25 per cent. Manufacture and sale of safety fuse for mining purposes only; no military products.
FRANCE.	
Etablissement Kuhlmann	There are a number of agreements with Kuhlmann relating to sodium sulphide, saltcake, dyestuffs, resins, nitrochalk, etc.; no military products.
Société Centrale de Dynamite	No investment or agreement; no military products.
Comptoir Française de L'Azote	I.C.I. has no direct association with this company, who are members of the International Nitrogen Cartel.
Casale Ammonia Company	Fertilizers only. This probably refers to an agreement long since expired between this company, Soc. Italiana Ricerca Industriale and the United Alkali Co. relating to use in U.K. of Casale process of manufacture of ammonia.
Davey Bickford Smith & Company	No investment in or agreement with this company.
Compagnie Continentale de Pegamoid	An I.C.I. investment of 4·63 per cent. Leathercloth producers; no military products.
Cartoucherie Française	An I.C.I. investment of 23·33 per cent. We also have an agreement with them governing the manufacture and sale by them under licence of sporting cartridges and cases; no military products.

APPENDIX 1—continued.

COMPANY.	PARTICULARS.
SWITZERLAND.	
Durand & Huguenin	We have agreements with this company covering licences to British Dyestuffs Corpn. to manufacture certain dyes. Dyestuffs makers; no military products.
GERMANY.	
Rheinisch Westfälische Sprengstoff A.G. ...	We have an agreement with this company relating to licences in respect of tetrazene cap compositions for sporting ammunition, and detonators.
Deutsche Solvay Works	No agreement with this company.
I.G. Farbenindustrie	Alkali products only. An I.C.I. investment of 2·7 per cent. We have also agreements with this company covering various industrial products, but not military products.
Westfälische Anhaltischen Sprengstoff A.G.	We have no agreement with this company.
Dynamit Aktiengesellschaft	We have a patents and processes and sales agreement with this company covering industrial explosives only. No military products.
NORWAY.	
Norsk Sprengstoff Industrie	We have an agreement with this company relating to the sales of and agency for sporting ammunition and accessories for use with industrial explosives. This company makes T.N.T. but no agreement or understanding exists with them on any military product.
ITALY.	
Societe Italiana Ricerche Industriale ...	See under France—Casale Ammonia Company.
Montecatini	No military products. We have an agreement with this company relating to ureaformaldehyde resins and moulding powders. They are members of the International Nitrogen Cartel of which I.C.I. are also members. No military products.
HUNGARY.	
The Hungarian Explosives Company ...	An I.C.I. investment of 12 per cent. No military products.
ROUMANIA.	
Roumanian Explosives Company.	An I.C.I. investment of 20 per cent. No military products.
CHILE.	
Compania Sud-Americana de Explosivos.	An I.C.I. investment of 42·39 per cent. No military products.
ARGENTINA.	
Cartucheria Orbea Argentina	Subsidiary company of Industrias Quimicas Argentinas Duperial S.A., which is an associated company of I.C.I.—percentage holding 50 per cent. This company is equipped, if desired by the Argentine government, to make small arms ammunition.
CANADA.	
Canadian Industries Ltd.	An associated company of I.C.I. Percentage holding 44·19 per cent.
U.S.A.	
Dyestuffs Corporation of America	No investment in or agreement with this company.
Allied Chemical Company	An I.C.I. investment of 0·47 per cent. No military products.
North American Chemical Company ...	No investment in or agreement with this company.
Roesler & Hasslacher Chemical Company ...	Subsidiary company of E.I. du Pont de Nemours. No military products.
General Motors Corporation	Motor car manufacturers; no military products.
E.I. du Pont de Nemours	An I.C.I. investment of 0·89 per cent. We have a patents and processes agreement with this company covering chemical and other products made by the parties, but excluding military products. We have also a purely sales arrangement on military explosives and powders. An I.C.I. investment of 0·175 per cent.

APPENDIX 2.

STATEMENT SUBMITTED BY MESSRS. IMPERIAL CHEMICAL INDUSTRIES LTD.

(See QQ. 3150—3153.)

THE EFFECT ON I.C.I. IF THE EXPORT OF SUBSTANCES OF POTENTIAL USE IN THE MANUFACTURE OF WAR MATERIALS WAS PROHIBITED.

The following are the only products exported by I.C.I. which are considered capable of being used as raw materials for the production of substances for use for lethal purposes, although they have more definite and usual applications in industry:—

Nitric acid for the manufacture of explosives;

Ammonium nitrate for the manufacture of explosives;

Nitrate of soda for the manufacture of nitric acid;

Sulphuric acid for the manufacture of explosives;

Chlorine for the manufacture of poison gas;

Centralite for the manufacture of explosives;

Dimethyl aniline for the manufacture of explosives;

Diphenylamine for the manufacture of explosives;

Glycol for the manufacture of explosives.

Anhydrous ammonia for the manufacture of nitric acid.

Ammonia liquor for the manufacture of nitric acid.

It is not feasible to determine the effect which the abandonment of foreign trade in these products would have upon the retention of plant, but in general terms it is considered that our ability to dilute skilled labour in an emergency would be reduced relatively to the proportion of workers displaced by the loss of foreign business. The following table shows, for each of the five years 1930 to 1934 inclusive, the value of and number of workers employed on these products which were sold outside the British Empire, together with the percentage reduction in our capacity for dilution:—

Year.	Foreign Sales Value. £	No. of Workers.	Reduction of Dilution Capacity. Per cent.
1930	19,905	4	1·2
1931	125,195	52	13·2
1932	73,984	30	6·3
1933	57,024	22	4·3
1934	125,174	61	9·7

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

SEVENTEENTH DAY

Friday, 7th February, 1936

PRESENT:

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A. (*in the Chair*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., LL.D., R.R.C.

Sir KENNETH LEE, LL.D.

Sir THOMAS ALLEN.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Sir ROBERT McLEAN;

Mr. H. BURROUGHS, F.R.Ae.S.;

Mr. CHARLES RICHARD FAIREY, M.B.E., F.R.Ae.S.;

Mr. FREDERICK HANDLEY PAGE, C.B.E., F.R.Ae.S.;

Mr. JOHN DUDLEY NORTH, F.R.Ae.S., M.I.Ae.E.;

LIEUT.-COLONEL LOUIS FREDERICK RUDSTON FELL, D.S.O., O.B.E., F.R.Ae.S., M.I.Mech.E.;

Mr. CHARLES VALENTINE ALLEN;

representing THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.,

called and examined.

3600. *Professor Gutteridge*: I have been asked by the Chairman to express his regret that he has been detained, and to apologise for his absence. I think, Sir Robert McLean, the Society of British Aircraft Constructors, Ltd. is a representative body of the aircraft industry?

Sir Robert McLean: That is so.

3601. *Professor Gutteridge*: And you are accompanied, I think, by a representative selection of people interested in the industry?

Sir Robert McLean: Yes.

3602. *Professor Gutteridge*: Perhaps I might refer to them: Mr. Burroughs, who is a director of the Gloster Aircraft Company; Mr. Fairey, who is past president of the Royal Aeronautical Society and chairman and managing-director of the Fairey Aviation Company; Mr. Handley Page, who is managing-director of Handley Page, Ltd; Mr.

North, who is managing-director of Boulton-Paul Aircraft, Ltd., and consulting engineer to the Director of Airship Construction, and a member of the Aerodynamic and Material and Chemistry Sub-Committees of the Aeronautical Research Committee; Lieut.-Colonel Fell, who is a director of Armstrong Siddeley Motors, Ltd.; and the director of the Society, Mr. Allen. Is that correct?

Sir Robert McLean: Yes.

3603. *Professor Gutteridge*: I think you have put in a written statement, and attached to that statement is an annex which indicates the membership of the Society, and another annex which shows who the members of the Council are?

Sir Robert McLean: That is so.

3604. *Professor Gutteridge*: Will one of you read the statement?

Mr. Allen read the following statement:—

MEMORANDUM BY THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

I.

The Society of British Aircraft Constructors was incorporated, as a company limited by guarantee, in the early part of 1916. It is the representative trade body of the industry, and is submitting this memorandum in that capacity.

There is given in Annex A* a list of the members of the society as at the date of the submission of this memorandum, and it will be seen from this that there are three classes of membership, (i) ordinary members, (ii) associate constructors, and (iii) associate members. Ordinary members and associate constructors must be constructors of complete aircraft or complete engines or both, while associate members are suppliers of parts, materials, fittings and so on, or are engaged in some business which is ancillary to the aircraft industry.

Under the society's original constitution there were only two classes of members, (i) ordinary members and (ii) associate members. Recently it was felt desirable to make provision for the newer companies engaged in aircraft or aircraft engine construction, and accordingly the class of associate constructor was created.

The ordinary members and associate constructors include every responsible British manufacturer of aircraft and aircraft engines; and the society is recognised by the Air Ministry as being fully representative of the industry.

Under its Memorandum of Association, the society has power to act generally as a representative body. It acts as an executive and consultative body but solely in such matters of principle as are the general concern of the industry. It does not intervene in the interests of individual members, nor does it deal with questions of prices or competition between individual members.

The Articles of Association of the society contain the provisions which are usual in the case of trade organisations; e.g., provisions as to election of members, the formation of sections of the society, the constitution of a council to control the affairs of the society and similar matters. Management of the affairs of the society is in the hands of a council consisting of individuals representing the ordinary members; and a list of the present members of the council is given in Annex B*. In addition to the council there is a technical committee to which

* See Appendix I, p. 531.

* See Appendix I, p. 533.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

are referred all technical matters, e.g., standardisation, design and research questions. This technical committee is divided into an aircraft section and an engine section. There is also a pilots' technical committee, subsidiary to the technical committee, which deals with technical questions from the standpoint of the pilot. *Ad hoc* sub-committees of the council and of the technical committee are formed as and when required.

In addition, the society has set up a civil air transport section to bring together the companies engaged in air transport for the discussion of problems of mutual interest. The society also set up an aerodrome owners' section.

II.

The society came into existence during the War at a time of great and increasing activity in aircraft and aircraft engine construction and when the need of an organised representative body was felt. In point of fact, the incorporation of the society slightly antedated the formation of the first Air Board, followed, at the end of 1917, by the creation of the Air Council under the Air Force (Constitution) Act, 1917.

From the formation of the society until the termination of the War the activities of the society were naturally largely concerned with War production questions. It is perhaps sufficient to say on this subject that, towards the end of the War, the then Secretary of State for Air, the Rt. Hon. Lord Weir, was good enough to communicate¹ with the society referring to the enterprise and courage of the industry and saying that the unity of the industry as embodied in the society had been of the greatest value to the Department of Aircraft Production; while the late Sir Arthur Duckham, then Director General of Aircraft Production, stated² that he had had a long experience of the Ministry of Munitions, having been in it since its commencement, and that in no other department had assistance been given comparable to that given by manufacturers to the Aircraft Production Department; and he expressed his appreciation of the work done by the society in assisting the Government to obtain so satisfactory an output of aircraft.

At the end of the War the membership of the society included many companies who came into aircraft and engine production solely for the duration and for the purposes of the War. These companies reverted to their pre-War activities, leaving some 35 ordinary members whose interests were wholly or largely in the aircraft industry; but of these about one half ceased to be members of the society during the next two or three years, either going out of business altogether or taking up some other form of work.

III.

The society desires to lay before the Commission information as to the history of the industry so that the Commission may be in possession of the full facts; but this seems a convenient point at which to make certain preliminary observations.

The question of what the size of the Royal Air Force should be is a matter of high policy and is the responsibility of the Government of the day, in whose decisions the industry is bound to acquiesce. The society may, however, legitimately submit observations on the question as to how the supply requirements of the Government, whatever those requirements may be, can best be met.

It is imperative that the Royal Air Force should be equipped with the best possible aircraft and engines for the various purposes of the Force. That the industry has fulfilled the obligation of designing and supplying efficient machines is manifest; and experience has shown that the requirements of the Royal Air Force can only be effectively and efficiently met by private enterprise, free from what

the author of the official history, *War in the Air*, has referred to as "the paralysing effect of official control."³

The society is not clear whether, under the Terms of Reference to the Royal Commission, it has to be assumed that the objections to the private manufacture of arms referred to in evidence⁴ already submitted to the Commission are to be taken as proved, or whether they are to be considered as objections which have been stated and remain to be proved, so far as they are capable of proof and do not necessarily remain matters of opinion. Whatever the intention may be, the society declares that the general allegations made are without foundation, while such specific criticisms and complaints as have been formulated are based on inaccurate or incomplete information.

IV.

The society proposes in this section to give the Commission some information about the pre-War position, prefaced with the observation that it is apt to be overlooked that private enterprise had made considerable progress in aircraft design and construction before the War. The official history, *War in the Air*, to which reference has already been made, says⁵ that it is not easy to assess the national debt to pioneer aircraft constructors. "A wealth of private enterprise lay ready to the hands of the Government" when the building of the air force began.⁶

In 1907, after the Wright Brothers had demonstrated the practicability of heavier-than-air machines, they offered their invention to the British Government. The offer was declined both by the Admiralty and the War Office, the Admiralty expressing the view that the invention would be "of no practical use to the Naval Service."⁷ It is right to add that, later on, after private enterprise had taken up aircraft design and construction, the Admiralty did develop a close and helpful interest in aviation and its possibilities.

Before the War, British military aviation rested on a state organisation which had a threefold basis. Research was the province of the Advisory Committee for Aeronautics (later called the Aeronautical Research Committee). Design and manufacture was the care of the Royal Aircraft Factory, with recourse to the industry for some manufacture of Government designed machines. Finally the Air Battalion of the Royal Engineers was envisaged as the user and operator of the aircraft thus produced.

The Advisory Committee for Aeronautics was appointed by the then Prime Minister in 1909⁸ to superintend aeronautical investigations at the National Physical Laboratory and to advise on scientific problems arising in connection with the work of the Admiralty and War Office in aerial construction and navigation. The committee comprised eminent scientists and representatives of the navy and the army. The terms of reference to, and the composition of, the committee have been changed from time to time but these changes do not call for special note.

The Royal Aircraft Factory had its origin in a Balloon Factory established in 1894.⁹ The transition from balloon manufacture to aeroplanes began with the creation in 1911 of the Air Battalion of the Royal Engineers, consisting of a Headquarters Unit, No. 1

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

Company (Airships and Balloons) and No. 2 Company (Aeroplanes).¹⁰ This was the beginning of the Air Force such as we know it to-day.

When the Air Battalion was formed the War Office was in possession of not more than six aeroplanes.¹¹ These were of various foreign types, and not all were in a fit state to fly. The flying personnel of the Aeroplane Company consisted at the outset of two officers who had learned to fly at their own expense,¹² while at about the same time the Admiralty gave permission for four naval officers to learn to fly, and they were taught to fly on British machines lent by a private owner.¹³

In the year 1936 pure research is still a responsibility of the Aeronautical Research Committee but design and manufacture of aircraft and engines have passed from the Royal Aircraft Factory to the industry. State design, which first broke down in engines, failed signally to rise to the occasion and to keep pace with designs produced by private enterprise. It may be added that, except in Soviet Russia, every one of the great nations engaged in the design and production of aircraft and engines places reliance on private enterprise.

V.

By the end of 1911 the Government considered that the future development of military flying could best be served by the formation of a separate service and in 1912 the Royal Flying Corps came into being.¹⁴ This consisted of a Military Wing, a Naval Wing, and a Central Flying School common to both wings.

As regards equipment, the policy of the War Office was, as explained above, to concentrate design work in the hands of the Royal Aircraft Factory; and the officially designed B.E. biplane was adopted by the War Office soon after its appearance. A number of British aircraft constructors were given small orders for the construction of this type of aircraft.

Opposed to this policy was that of the Air Department of the Admiralty. The Naval authorities encouraged British constructors, so far as they could with the funds allowed, by buying and trying out examples of various promising types of British aircraft produced by private enterprise. The first machine to alight on water, the first machine to fly off the deck of a warship under way, the first successful seaplane, the first machine with folding wings, the first machine to carry a torpedo and the first machine to carry a 2-pounder gun—all these were produced by private enterprise before the War. Other privately designed aeroplanes established a British Duration Record, a British Height Record with one and two passengers, a World Height Record with three passengers and a World Duration Record with seven and nine passengers. In 1913 a British flying-boat won the Mortimer Singer prize for the first amphibian to make successive landings and alightings on land and water respectively, and in 1914 a British seaplane won the second contest for the Schneider Trophy at Monaco in the face of what was considered to be most formidable French competition. This success created a very great impression abroad although it attracted little attention in this country.

As one example of the experimental work encouraged by the Admiralty, reference is made to the Report on Experiments in 1911 on an Avro "hydro-aeroplane"—with notes and suggestions for further experiments—which is printed as Appendix III to the book *Airmen or Noahs* by Rear-Admiral Murray F. Sueter, C.B., R.N. M.P., who at the time was Director of Air Department of the Admiralty.

The foregoing is no more than the briefest summary of the activities of some of the companies in the design of aircraft, but it evidences the boldness of private enterprise as opposed to, let us say, the caution of the War Office, and indicates the resources in design which were even then in the service of the industry.

At August, 1914, there were twelve aircraft firms and the following summary may be of interest:—

AIRCRAFT MANUFACTURING CO., LTD.—This was founded in 1912 and acquired the British rights for Farman aeroplanes. Later, a factory was established at Hendon and in 1914 the company obtained the services of Captain Geoffrey de Havilland as chief designer, thus laying the foundations for the production of the well-known series of D.H. aircraft.

SIR W. G. ARMSTRONG WHITWORTH & CO., LTD.—This company opened an aircraft department in 1913 and manufactured a small quantity of B.E. biplanes for the War Office.

A. V. ROE & CO., LTD.—Founded in 1910 by A. V. Roe, this company produced the prototype of the machine which afterwards served as the standard training aeroplane. Several Avro biplanes of various types were sold to the Admiralty.

BLACKBURN AEROPLANE COMPANY, LTD.—This was founded by Mr. Robert Blackburn who built his first aeroplane in 1910. Various types were produced which did not interest the authorities.

BRITISH AND COLONIAL AEROPLANE CO., LTD.—Founded in 1910 this company organised flying schools at Larkhill and Brooklands and designed a number of military aeroplanes; but the only orders placed with the company by the War Office were for B.E.2 biplanes. It supplied several experimental aeroplanes to the Admiralty and produced a single-seat biplane known as the "Bullet" which was later bought in small quantities.

GRAHAME WHITE AVIATION CO., LTD.—Founded by Mr. Claude Grahame White in 1911, and in 1913 acquired a licence for the Morane-Saulnier monoplane.

HEWLETT AND BLONDEAU, LTD.—Founded in 1913, it built B.E. aeroplanes for the War Office.

MARTINSYDE, LTD.—This company built its first aeroplane in 1908, and afterwards built successful monoplanes with notable performance which failed to find approval for service use.

HANDLEY PAGE, LTD.—This company was founded in 1908 and devoted early experiments to development of inherently stable aeroplanes, both biplane and monoplane. Its only official recognition was the placing of small orders for B.E.2 biplanes by the War Office.

SHORT BROTHERS, LTD.—This company was founded for the construction of spherical balloons in 1898. In 1908 acquired the rights for the Wright patents and in 1911 produced a successful British seaplane. With Admiralty encouragement conducted valuable experiments in the development of naval aircraft.

SOPWITH AVIATION COMPANY, LTD.—Founded in 1911, it produced a notable series of aeroplanes which put up various records, and it supplied several experimental types of aircraft to the Admiralty.

S. E. SAUNDERS, LTD.—This firm of boat-builders built hulls for Sopwith flying-boat and amphibious machines and received a small order from War Office for B.E. biplanes.

J. SAMUEL WHITE AND SONS, LTD.—This ship-building firm began the design and construction of seaplanes in 1912.

VICKERS, LTD.—The aviation department of this company was founded in 1911 with the acquisition of the British rights for a French aeroplane. It built all-steel aeroplanes which

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

failed to interest the authorities; but it received small orders for B.E.2 machines from the War Office.

So far, nothing has been said as to the pre-War position of aircraft engine design. The official policy, which did little to foster the aircraft designer, had most serious effects on the development of engines. Design and development of aircraft engines are very costly matters and it is hardly a matter for surprise that there was unwillingness to embark on expensive programmes of design which were likely—indeed inevitably so in view of the limited orders which would be forthcoming—to be a source of loss, particularly when it was known that the Royal Aircraft Factory was engaged in designing its own engine. Some further observations on the subject of engines will be found later in the section dealing with War-time production.

VI.

This, then, was the position in August, 1914, with the result that four Squadrons of the Royal Flying Corps took the field with 66 aeroplanes, almost wholly of French design or designed by the Royal Aircraft Factory and all fitted with engines of foreign design and make. It has been stated that 113 aeroplanes were left at home, though with the exception of about 20, nearly the whole of these were worn out or unserviceable.¹⁵

Until orders placed after the outbreak of the War began to materialise the flying services had to depend as best they could on existing equipment, augmented by the deliveries of Government-designed machines ordered before the War, and on whatever aeroplanes could be obtained from French constructors. Considerable reliance had to be placed on French sources of supply, particularly in engines, on which the British services relied solely for the first six months of the War.

The British aircraft industry accepted orders up to its maximum capacity and set about expanding works. Gradually the motor-car industry utilised its available resources to assist, turning its body-building departments on to fuselage and wing construction, followed by the coach-building trade, furniture makers, and scores of other firms whose manufacturing facilities lent themselves to the production of aeroplane components and accessories.

While the Royal Flying Corps was forced to depend on only a fitful supply of aircraft during the initial six months of the War, new designs of aircraft were being prepared by the British industry, but before the efforts being made could become effective, private enterprise in the service of the German Air Force produced the Fokker monoplane. This machine in the hands of some of Germany's most able pilots gained a material and moral ascendancy over the Royal Flying Corps in the field, and the B.E.2c, which was bearing the brunt of work of the Royal Flying Corps, suffered heavily. When the Fokker first appeared there were sixteen R.F.C. squadrons in France, of which twelve were equipped with the B.E.2c.¹⁶

Urgent demands were made by the R.F.C. in the field for the speeding up of the production of fighting aeroplanes and for efficient fighters, and early in 1916 new types were received in France which could counter the Fokker monoplane. The R.F.C. had meanwhile to pay a heavy price in the endeavour, with inadequate equipment, to carry out the work of helping the Army. Casualties mounted high and important Army reconnaissances and bombing raids often could not be completed owing to the shooting down of British aircraft. R.F.C. Headquarters laid down a rule that a machine proceeding on reconnaissance had to be escorted by at least three other machines; all had to

fly in close formation and the reconnaissance was not to be continued if any of the machines became detached. This had the effect of reducing the effective strength of the R.F.C. as although the variety of work required to be done for the Army did not diminish, many more aeroplanes had to be set aside for certain missions to the exclusion of others.

Meanwhile, the Admiralty had continued to pursue its policy of encouraging private enterprise. It was in possession of satisfactory types of aircraft (easier and cheaper to build than those of Government design) and was urging the development of engines. It was asked many times¹⁷ by the War Office to hand over machines to the Royal Flying Corps and on occasion did so,¹⁸ as, for instance, in the latter part of 1916 when a squadron of machines—all of private design—were made available by the Admiralty. This competition between the two services, coupled with the casualties in our Air Force and the effects of the early air raids on England, gave rise to public agitation urging that some co-ordination should be introduced. An Air Committee under the Chairmanship of Lord Derby¹⁹ was set up to prevent competition between the Services and to increase the output of machines by co-ordination of design and the placing of orders. This Committee had no executive powers and failed for lack of them. Its failure was followed by the appointment of a Committee known as the Burbidge Committee to investigate the position with regard to the Royal Aircraft Factory. The Committee reported²⁰ on the 12th May, 1916, setting out its conclusions, including the following:—

(1) Such an experimental factory should be in existence . . . the factory should be reorganised.

(2) The War Office standard of efficiency as regards finished products was met.

(3) The financial resources placed at the disposal of the Factory had been ample to allow experimental work to be expeditiously performed and should have placed useful data at the disposal of the War Office, Admiralty and private trade.

(4) The organisation in non-productive departments was liberal and on a scale unknown in private works.

(5) Improvements possible in parts of the organisation and management.

Next in historical order was the decision of the Government in May, 1916, to set up an Air Board under the Chairmanship of Lord Curzon.²¹ This Board had wider controlling powers but still no executive power and was unable to eliminate friction between the two fighting services.

A further Committee was set up under the chairmanship of Mr. Justice Bailhache to inquire into the administration and command of the Royal Flying Corps. This Committee in its report²² dealt with a variety of matters and in relation to the Royal Aircraft Factory it reported that its continued existence was essential but that it should not become a manufacturing establishment but should confine its activities to experiment and research, repairs and manufacture of spares.

Early in 1917 a new and second Air Board was set up under the presidency of Lord Cowdray, and the responsibility of placing the actual orders for aircraft and engines was transferred from the Admiralty and War Office to the Ministry of Munitions. This release of the industry from competition between the two services and from narrow restrictions contributed to the successful outcome of the War.

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

The complete elimination of reliance on foreign engines was wholly due to private enterprise. The Royal Aircraft Factory which, as stated, had been engaged on engine design, gave it up and D. Napier & Co., Ltd., undertook development of an engine based on the work done by the factory. This model never came into extensive use and the company proceeded on its own lines. Rolls-Royce, Ltd., rejected the factory designs, which they considered were not on right lines. They produced highly successful engines of their own designs of which large numbers—many thousands—were built.

Other companies designed engines based to some extent on foreign designs because of the reliance placed by the Government on foreign engine design.

The total British production of aircraft and aircraft engines during the War was:—

Aircraft	55,093
Engines	41,034

(These figures may not be absolutely correct but they can be taken as sufficiently correct for present purposes.)

These figures indicate the productive powers and elasticity of British industry in time of emergency. Indeed, the head of the German Army Air Service has referred²³ to the utter impossibility of coping with the British programme of construction.

It should perhaps be added that those companies who were called in to construct aircraft and engines designed by others were given every possible help and assistance by the designing companies. All resources were pooled with a view to the greatest possible production.

VII.

Evidence has been given before the Commission in relation to the change-over from Government-designed machines to those designed by private enterprise.

Dr. Addison has informed the Commission²⁴ that the constant development and progress in type which was made during the War was not made by the private firms, but that a central body was set up on which were "representatives of the more alert private firms". Dr. Addison's recollection is at fault. There was no such central body. The machines produced by the designing firms were wholly designed by them.

Reference has been made in particular to the B.E. machine designed by the Royal Aircraft Factory; and it has been stated²⁵ that it showed a great advance in aeronautics and that it was a highly successful aeroplane.²⁶ The industry agrees that it showed an advance in aeronautics, but it did not prove to be a good service aircraft and its use was persevered with much too long. It was the machine which had to be used because owing to the policy of concentrating upon Government design, no other was readily available for the Royal Flying Corps. When aircraft firms were given a free hand and their designs adopted for quantity production the results soon became obvious.

One author²⁷ in dealing with B.E. aircraft says: "In the retrospect one can only regret that the machine was not roundly condemned. It might then have been scrapped and replaced by efficient machines earlier than it actually was and the tragedy of the Spring of 1917 when our outclassed B.E.'s were shot down wholesale might have been avoided".

VIII.

Dr. Addison further states²⁸ in his evidence that reliance on private manufacture proved to be insufficient and dangerous. There appears to the society to be some confusion here between production by the maker and the method of ordering by

the user. When the country did rely on private design and manufacture of aircraft and engines, the production was forthcoming.

It has further been stated²⁹ that up to January, 1917, the manufacture of aeroplanes was the business of a number of different departments—the War Office, the Admiralty and the Air Board. What has not been pointed out is that this confusion was not the creation of the manufacturers. It was not their fault that the competing Air Services were not co-ordinated at an earlier date. It may not be a question of fault but simply due to the fact that the necessity for a combined Air Force was not appreciated by the Government so soon as it might have been, while the difficulties of such a change must have been considerable. But nobody now suggests that the Air Ministry should be abolished and that there should be a reversion to the old system of divided control.

It is inevitable that reliance should be placed on private manufacture. In time of war the whole resources of the nation are required and it is inconceivable that in peace time the whole of the manufacturing organisations of the country could be organised on a war-time basis able to supply at a moment's notice the whole of the anticipated requirements. This would lead to the result that the whole of the manufacturing resources would be continually enmeshed in war-time production or waiting for it. The security of the nation in the War depended upon the manufacturing resources of the country, greatly expanded, of course, because the output demanded was overwhelmingly in excess of anything that had been visualised.

If what is meant is that under similar circumstances there would have to be some form of central body such as was brought into existence by the creation of the Ministry of Munitions, no one could possibly dissent, but it may be remarked that the backbone of the Ministry was the private industrialists who readily gave their services to co-ordinate and control production.

IX.

For the equipment of the Royal Air Force immediately after the War there was available a quantity of aeroplanes and engines in service, awaiting delivery or in production, only a very small proportion of which could be required. Certain new types of aircraft in production were abandoned for one reason or another while others were retained as current service types.

Consideration was then given to important technical problems which the stress of war had hindered. The war life of an aeroplane was a negligible quantity but in peace the life of an aeroplane is considerably extended, and the question of maintenance became of primary importance. Closely associated with this question was that of the availability of materials. The War had shown that for timber, the principal material used in the construction of aircraft, this country had to rely entirely on overseas supplies, and the enormous demands had resulted in the forced use of insufficiently seasoned wood.

The natural trend, therefore, was towards the use of a material which was not only easily obtainable in this country but one which was not susceptible to the vagaries of climate. Extensive research and experiment in the application of metal to aircraft construction was conducted, and in 1923, when the process of re-equipping the Royal Air Force had been inaugurated, the first all-metal machines were ordered in quantity by the Air Ministry.

The progress in the evolution of metal aircraft, however, was not rapid. The underlying problem was one of evolving methods of construction which, although cheap and economical to make in small quantities, would be suitable for mass production in

²³ German War in the Air. (Hoepfner.)

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

an emergency. This involved complex problems and co-operation between research, experiment and production.

It is probably true to say that no particular form of metal construction can yet be said to be standardised because the design of the aeroplane structure and even the aeroplane itself is still in an indeterminate state. A principal requirement of an aeroplane of any type is lightness of structure weight to enable the biggest military or commercial load to be carried, and immense efforts have been directed towards the reduction of structure weight. Parallel with the development of the aeroplane, continual research has been made in the evolution of new materials which might contribute still further to the reduction of weight and increased life of the aeroplane. Apart from the development of suitable light alloys the production of special steels, particularly of the stainless type, has been eminently successful.

A full account of post-War progress in aircraft design—both of civil and military types—would require a very long technical section of this memorandum, and it is only practicable to refer to a few examples. The production of the Fairey "Fox" marked a great step forward in reduction of head resistance. The Handley Page "Hannibal" type brought a new conception of comfort and economy in air travel. The D.H. "Moth" showed the possibilities of the light, low-powered machine. The system of metal construction devised by the Hawker Co. (the successors to the Sopwith Co.) marked a substantial advance in constructional methods and did much to simplify the problems of maintenance. The Short types of metal flying boats embodied fundamental advances in the design of large marine aircraft while the Supermarine "Southampton" class set a new world standard of performance for military flying boats. These, as stated, are merely examples. Designers generally have done outstanding work, as is frankly recognised throughout the world. At one time this country held all three of the world's major flying records—speed, height and distance; and foreign governments found it necessary to subsidise their constructors heavily to beat those records. The only big post-War international air contests—the Schneider Trophy series and the England-Australia races—were won by British aircraft, powered by British engines.

There has been remarkable progress in the aircraft engine. The increased demand for performance has called for greater outputs without increase in weight and the weight/horsepower ratio has been enormously improved. Military efficiency has continually demanded greater reliability and reduced fuel consumption. Reliability has been so improved that the modern aero-engine is now able to run for periods in excess of 500 hours between overhauls whereas as recently as ten years ago this figure seldom exceeded 50 hours.

The development of supercharging and gearing has also been noteworthy and has contributed to the remarkable increase in performance at height, climb, take-off and weight-carrying capabilities of British military aircraft.

Further reference to the progress which has been achieved is made later under the heading of research and development.

The progress which has been made in the design both of aircraft and engines since the War could best be appreciated by a comparison of the performance of typical aeroplanes in service in the Royal Air Force in 1926 and 1936. In this period of only ten years the complete change-over from wood to metal was achieved and aircraft performance enormously increased.

X.

The Commission has been informed²⁰ that a new type of aircraft bearing the name of some aircraft firm which is submitted for testing by the Air

Force is by no means the product of private industry, but that it is the product in proportions of 50-50 of state research and private enterprise in design. The statement²¹ has also been made that the aeroplane is designed under close supervision from the Air Ministry to a fairly elaborate specification so that the industry is working with a great deal of state assistance and under very close supervision. These statements are incorrect.

Any aeroplane which is submitted for testing by the Royal Air Force is wholly the product of the designing firm. The Air Ministry issues to aircraft constructors a specification of requirements for a new type of aircraft. The duty of preparing this specification rests primarily on the Air Staff, which consults the technical department as to the possibility of the requirements being met in the then state of the art; and the specification of requirements issued to the industry states the problem in broad outlines. Particulars of desired performance are given, as also are particulars of the military load and of the equipment for which provision must be made. It is then left entirely to the constructor to design aircraft which will meet these requirements, subject to certain standard regulations as to airworthiness.

A constructor is given a limited time within which to produce his ideas of a machine to meet the requirements, and these ideas are submitted to the Air Ministry. Committees of the Air Ministry examine the information laid before them and decide with which constructor or constructors an order for a prototype shall be placed, assuming it is decided to place any order at all. In due course the machines are delivered, to be subjected at Royal Air Force experimental stations to vigorous and searching tests of all kinds, and on completion of these tests the machine considered to be the best is, in theory, adopted for production; but it does not at all follow that that machine will go into production. Aircraft design is still far from reaching stability. Rapid technical development leads to rapid changes in ideas and frequently machines have been considered to be obsolete for one reason or another at an early stage.

Now it has often happened that a constructor whose machine has not been adopted for production, or indeed whose preliminary ideas have not been accepted, has had the courage of his convictions and has built a machine which in his opinion, having regard to his knowledge and experience of service needs, is superior to any machine which complies strictly with the specification of requirements. Such an aircraft is known as a "private venture machine" and is designed in accordance with the designer's own specification. Over the last ten years one in every three private venture machines built has been adopted for production by the Royal Air Force, whereas in the case of prototypes built to comply with Air Ministry specifications of requirements only one in six has been accepted for production. This is not in the least any criticism of the Air Ministry. Indeed, it is rather the reverse, because it indicates that the Air Ministry is receptive to new ideas and is prepared to acknowledge the superiority of a private venture design over a design which complies with Air Ministry specification of requirements.

In the case of engines the designer sets his own standard and in effect prepares his own specification, which is submitted to the Air Ministry for consideration if the engine is of a type for which Government orders are sought. The initiative rests with the designer.

The explanation of the pre-eminence of the industry is that it retains its spirit of imagination and adventure. It knows what it can do and desires to provide the Royal Air Force with the best possible aircraft embodying the latest knowledge of the

²⁰ *Minutes of Evidence*, 7th and 8th Days, p. 150.

²¹ *ibid.*

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

art. But for private venture machines the equipment of the Royal Air Force to-day would be much less efficient than it would have been if the equipment had been restricted to machines which simply met the requirements of the specifications and did not go beyond them.

Solution of the problems of design of military aircraft involves the incorporation of the lessons of experience in the field as well as provision for rapid production in emergency. The aircraft industry has proved again and again its ability to overcome the difficulties of one of the most complex problems in engineering.

Examples could be given of machines which, designed to fulfil the requirements of an Air Ministry specification have, by virtue of the advances in research and design made by constructors, actually given performances much more efficient than the requirements laid down by the Air Ministry. This is indicative of the great extent to which the ideas of a competitive industry can outrun those of a government department. It would probably be admitted by the higher ranks of the Royal Air Force that the revolution in performance which has been brought about by private enterprise has entirely altered the conception of air strategy and the mobility of the Air Force.

It will be understood that the problem which has to be faced by the constructor is not simply the production of a single prototype aircraft. At every stage of the design the question of cost and means of production has to be weighed. The contractor is thus faced with the interwoven problems of efficiency in design and possible rapid production in numbers, although in fact he is in the first instance constructing only one or two machines. These are problems so difficult that they demand the very highest qualities of engineering skill, combined with long experience.

The question of supervision needs explanation. It has been made clear that the constructor and the constructor alone is responsible for design. There had, however, grown up a system under which designs and the technical details thereof had to be sent to the Royal Aircraft Factory (now called the Royal Aircraft Establishment) for checking the calculations submitted by the designer, as evidence that the requirements of structural strength, etc., had been fulfilled. By some date after the War a large Airworthiness Department existed at the Royal Aircraft Establishment to do this work and this led to congestion and consequent intolerable delay. The rule was that no machine could be flown until the calculations had been passed by the Royal Aircraft Establishment. Meanwhile, the constructor proceeded with construction at his own risk, and in practice this "checking" work was frequently not completed until the machine was almost ready to be flown.

The position created by this centralised control showed signs of getting even worse; and the Air Ministry accordingly arranged with the industry that each constructor should install and maintain a department which would do all the work formerly done at the Royal Aircraft Establishment. This department was, and remains, under the control of the constructor and is maintained at his expense; but at each main constructor's works there was installed an Air Ministry "Resident Technical Officer" charged with the duty of seeing that the constructor was carrying out the system in accordance with the requirements laid down by the Air Ministry. This officer was authorised to make such checks from time to time as would enable him to determine whether the regulations were being observed.

This procedure led to a great deal more freedom, and avoided much of the unnecessary delay under the old procedure; but, even so, it was found that difficulties arose. It is sometimes necessary for minor

departures to be made from the original drawings in order, for example, to facilitate manufacture; and if the Resident Technical Officer considered that these departures should not be allowed or if he merely had some doubt on the point, he referred the matter to the Air Ministry for approval. (The extent to which this was done depended on the personality of the individual officer.) This involved reference to a number of officials at the Air Ministry with the result that considerable delays still occurred. The procedure has now been further modified with the result that the constructor may, if he wishes, ask advice from Air Ministry departments through the Resident Technical Officer, but the constructor is at liberty to accept or reject the advice so given and it is laid down that the constructor is the person responsible for the design and production of the machine and that any advice which may be given by the Air Ministry is without any acceptance of responsibility.

In the same way there has been considerable modification in the procedure of inspection. During the War all inspection work was done by the Aeronautical Inspection Department who, at the end of the War, had no less than 11,000 officers engaged in inspecting detailed parts as well as the complete article. It was recognised in course of time after the War that responsible constructors were fully competent to undertake inspection and in fact had inspection systems which duplicated the work. It was therefore arranged to throw the whole responsibility for inspection on the constructor, subject to an overriding check by an Air Ministry inspector for the purpose of ensuring that the standard of inspection is maintained. This scheme has effected great economy in the cost of inspection; and the principle has been extended to the manufacture of accessories and materials.

These procedures have largely abolished the expense and delays which arose and were increasing under the system of centralised control and have made for economy in production. The society believes that the Air Ministry would agree that the system has worked well and that constructors have faithfully co-operated for the purposes of ensuring the success of the system. Further decentralisation is being pursued, it being recognised that rapid production is essential and can only be achieved by decentralisation and throwing responsibility on the constructors.

XI.

It has also been stated²³ that it is quite obvious that the kernel of the industry ought to be the research department. The society must emphatically disagree with the proposition. The society must also contradict the statement²⁴ that the aircraft industry does little research.

Research is undertaken at (a) government establishments, and (b) constructors' works.

So far as concerns government establishments, research is undertaken by the National Physical Laboratory and by the Royal Aircraft Establishment. The programme of work to be done at the National Physical Laboratory is settled by the Aeronautical Research Committee (to which reference has already been made) after consultation with the Air Ministry, the Royal Aircraft Establishment and this society. The Aeronautical Research Committee superintends this work.

The programme of research work at the Royal Aircraft Establishment is settled by the Air Ministry, though the Aeronautical Research Committee may make recommendations regarding this programme.

There is considerable contact between the National Physical Laboratory, the Royal Aircraft Establishment and the industry. Regular meetings are held between the Aeronautical Research Committee and

²³ *Minutes of Evidence*, 7th and 8th Days, p. 142.

²⁴ *Ibid.*, p. 194.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

representatives of this society and the society is appreciative of the helpful attitude of the Committee. The programme of research drawn up by the Aeronautical Research Committee is discussed with the society's representatives who may make suggestions for other fields of research; and perusal of the minutes of these meetings would show that there is frank discussion. Information and ideas are submitted by the industry; the problems involved are discussed, and the position is explored with a view to determining the best lines of investigation. Not a few of the publications which have been issued owe a debt to suggestions and advice from the aircraft industry.

There is, both at the National Physical Laboratory and at the Royal Aircraft Establishment, apparatus of a kind which could not be economically provided by an individual constructor because no constructor requires to keep such apparatus in continuous employment. It was at one time proposed to set up a British Aircraft Research Association by arrangement with the Department of Scientific and Industrial Research but in view of the fact that such an association could not embrace the whole of the work which has to be done at the National Physical Laboratory and the Royal Aircraft Establishment—the research work there covering armament and other problems outside the scope of the work of the industry—it was felt to be neither advisable nor economical to duplicate the organisation. Where, however, a constructor can usefully employ research apparatus he has installed it, and constructors have wind tunnels, tanks, mechanical and chemical laboratories adequately staffed and in constant use.

There is an enormous difference between, on the one hand, research and development work done at research establishments, the correctness of the results of which is a matter of argument or opinion, and, on the other hand, research and development work as embodied in design of actual aeroplanes, when its applicability to the design in which it is embodied is proved or otherwise by the tests on the aircraft. The problem of aircraft design is not solved by logical deduction from exact data. The data do not exist, while the logical processes are not available, principally because the number of variables is too great. Aircraft design is an art and not a science and the point is soon reached when the resources of science break down and the creative genius of the designer in the exercise of his art becomes paramount. It is a creative art in the sense that the designer must be able to visualise the whole conception of the aircraft which he is designing—performance, outward form and internal structure. Fundamental research work is a good general guide but there is a gulf between the published data at the disposal of the designer and the finished aircraft. If it were not for the large amount of *ad hoc* experimental work done by constructors the gulf between published research and practical design would not be bridged.

Design units that are too large or hampered by restrictions are undesirable. Flexibility is necessary for rapidly changing conditions; and past experience which led to the system under which constructors are approved for design, as set out above, shows that the necessary degree of flexibility cannot be found in a government department where the necessity for avoiding individual responsibility results in a multitude of restrictions, regulations and instructions which is a poor substitute for the judgment of a competent engineer in any particular set of circumstances.

The problem of aircraft construction, using the word in the sense in which it refers to the design and building of what is known as the "airframe," is one which lies apart altogether from considerations of technical information such as may be supplied by research departments either of the Government or of individual firms. Advances in design depend on the highest development of technical skill and

such advances can only be brought about by the close co-operation of a board of directors who, in the belief that in the end the experiment may be justified and enterprise rewarded, are prepared to back daring and sometimes hazardous schemes which may or may not show an adequate return for the money expended, and to support, through barren years of development and research, men who may fail. All this calls for team work and freedom from restrictions.

It has been said that designers work on the basis of an immense amount of research and experimental work conducted by the Air Ministry and the Department of Scientific and Industrial Research and the suggestion is made as though no other material were available. In truth publications comparable with those issued by the Aeronautical Research Committee are obtainable from reports issued in other countries. Some of these are of high value and cover new ground; and designers find it necessary to maintain a close survey of these foreign publications. The published reports in this and other countries form a common pool of knowledge available to designers in all countries. Much of the work covered by these reports is of a fundamental scientific character and a large amount of further work by the industry is necessary to make it applicable to purposes of design and construction.

A very large amount of scientific and aerodynamic research has been and is done by the aircraft industry. The development of the Handley Page slotted wing, the Frise aileron, the de Havilland differential aileron control, and the retractable undercarriage—to mention a few important developments only—was due to research by firms in the industry. So was the general theory and technique of metal construction and much experimental work relating to the problem of aerodynamic interference. Recently, announcements have appeared in the press on the subject of "geodetic" construction, a system of aircraft building developed entirely at the cost and initiative of an aircraft manufacturer which marks an important stage in reduction of structure weight. In view of the official desire for secrecy the society is not at liberty to add to the information already published on this subject.

Frequently the industry has pursued research in spite of official indifference, and even discouragement. Since specific reference has been made²⁴ to the slotted wing invention it should be explained that automatic operation of the wing slot was achieved by the inventor after official research into the same problem had failed.

Much research work has also been done by engine designers, and the work is going on continuously. More than one of them has more single-cylinder units running than the Royal Aircraft Establishment, and it is on single-cylinder units that aero engine research work is really effected. The research programme covers an extensive programme embracing supercharger development, induction systems, exhaust turbo blower drive, exhaust systems, etc. A specialised installation section deals with research work on engine cowlings and mountings and problems connected with reduction of drag in relation to radiators for both coolant and oil services.

One company has developed air-cooled sleeve valve engines, which would never have been done had the matter depended on official action as the conclusion drawn from official research work indicated that the air-cooled sleeve valve cylinder was not a practical possibility.

Development and research work on high temperature cooling has been done solely by the industry and so has the development of petrol injection.

Another important item on which a great deal of research work has been done by the engine manufacturers is that of cylinder heads. Cylinder construction and technique and the use and manufacture

²⁴ Minutes of Evidence, 7th and 8th Days, p. 195.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

of lead bronze bearings on both air and liquid cooled engines have been effected and produced as the result of research and development work by the private companies.

Engines as at present produced for high speed and high altitude flying have been intensively developed and are called upon to give high horse powers and maintain the same up to high altitudes to deal with present Air Force demands. The designer must also provide drives and various forms of control for variable pitch airscrew operation, supercharger, boost control, undercarriage pumps, vacuum pumps for blind flying, gun gear and a number of other operations. To achieve these results while maintaining a lower power/weight ratio has made it necessary for aircraft engine manufacturers to build up large and very costly design, research and experimental departments; and to maintain these departments in a state of efficiency, highly skilled and experienced personnel is essential.

Although there is the keenest commercial competition between manufacturers, arrangements are made for the mutual exchange of information on common technical problems through the medium of the society.

No reference has been made to instruments, cameras and other details of equipment—each of them important items. Here again, private enterprise has produced articles which need not fear comparison with those produced in other countries. It would, perhaps, be tedious to give a list of the many items of equipment, all of which have to be designed and incorporated in the complete machine; and there are, as it will be imagined, examples which it would not be in the public interest to explain. There is a whole world of scientific devices in the final equipment of aircraft for the Royal Air Force.

Standardisation of materials is effected through the medium of the British Standards Institution which body, at the suggestion of the society, set up an aircraft industry section. That section works through committees on which sit representatives of the Air Ministry and of the branches of the industry involved; and the final specifications are approved by the society's technical committee.

XII.

The export trade in military aircraft is conducted subject to general and particular principles laid down by the Ministry. This extends to the publication of details of new aircraft and engines.

For this purpose there are three categories or lists: The Secret List, the Part Publication List and the Open List. This covers not only the machine produced to meet an Air Ministry specification of requirements but also includes the "private venture" machines to which previous reference has been made.

Aircraft on the Secret List remain wholly secret. No information of any kind may be given about them; indeed, their existence may not be mentioned.

When a machine is transferred to the Part Publication List certain general information about it may be disclosed and preliminary negotiations entered into with prospective foreign purchasers; while machines on the Open List may, in principle, be sold abroad without restriction.

The decision as to the time when transfer from one list to another shall be made rests with the Air Ministry, though in general a machine is transferred from the Secret to the Part Publication List when it has made its first flight.

Beyond these regulations the Ministry exercises an overriding veto on foreign sales of military aircraft, including the grant of licences to manufacture abroad. This is in addition to the necessity for obtaining an export licence. It is assumed that the

Board of Trade would not grant an export licence without reference to the Air Ministry, but in practice the matter is referred to the Air Ministry by the aircraft constructor direct in the beginning, and the constructor acts in accordance with the wishes expressed by the Ministry.

No export licence is required in the case of a civil machine.

There is a clear line of demarcation between a civil machine and a military one, subject to the observation that any civil vehicle may be used for war purposes. Just as an omnibus or an ocean liner may be used for the transport of troops, so might a civil aircraft be used for that purpose or for the transport of supplies. It could not, however, be used without modification as an effective war machine except in the absence of adequate aerial defence. A civil aircraft could be so designed that it could be converted into an effective war machine, but that would involve modifications of a major structural character, though comparatively minor modifications might be sufficient to convert certain classes of civil machines into useful war machines for such purposes as reconnaissance and photography.

The total British export trade in 1934 of this industry was about 25 per cent. of the productive capacity then devoted to Air Ministry work. That represents an important margin of reserve productive capacity and in fact the margin of productive capacity is rather higher than that when all factors are taken into account. This trade is essential to an industry which is subject to considerable fluctuations in turnover. It provides employment and if this country lost the trade it would go elsewhere.

XIII.

Observations, which are difficult to follow, have been made in the evidence regarding civil air transport. Lord Marley says³⁵ "The British aircraft industry by a process of national ignorance is immensely behind the aircraft industry in other countries" though he goes on to say that that is "not entirely" the fault of the industry. Later on he says that in this country commercial flying has been allowed to drop "so far behind" because it has been left entirely to uncontrolled private enterprise; and that even in military machines this country has got equally behind. He adds³⁶ "If you want efficient aeroplanes and no corruption you have got to nationalise your industry".

With respect, the statement that this country has got "equally behind" in military machines hardly calls for reply. It is answered by the equipment of the Royal Air Force and by sales abroad in keen competition with other countries.

The association between corruption and efficiency is not understood; and therefore the society does not propose to deal with it. This part of the evidence, so far as regards civil aviation, seems to confuse construction with operation and to overlook the facts. So far from commercial flying having been left to uncontrolled private enterprise it has been the policy of the Government to place the operation of all main routes in Imperial Airways, Ltd., and the constructors can only supply such aircraft as the operator is prepared to buy. It is not much use to point to the air service between New York and Los Angeles as an example to be followed. Nothing can alter geographical facts; and there is no place in the world where any nation could establish an air service within its own territory comparable with the New York-Los Angeles route. Nor would any other nation be prepared to pay the vast sums paid to the United States Air Transport Companies.

³⁵ *Minutes of Evidence*, 7th and 8th Days p. 160

³⁶ *ibid.*, p. 165.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

The evidence of Lord Marley on this phase of the matter is to some extent rebutted by the evidence³⁷ of Mr. Noel Baker who refers to the international restrictions from which civil aviation suffers. That is true. When the Versailles Treaty was drafted a separate conference was held dealing with international aviation. This was attended by the then chairman of the society, who endeavoured to ensure that the restrictions on international flight should be modified so far as could be arranged and an International Commission on Air Navigation was set up from which considerable hopes were entertained. These hopes have not been justified for various reasons.

While the society believes that there will be still greater and greater development in civil air transport it considers that that development will only come by way of freedom from restrictions and by education and demonstration. If by internationalisation of air transport is meant international control the society must say that it cannot visualise the satisfactory working of a body under international or League of Nations control; and the same remarks apply to a national body subject to international control. What in the opinion of the society is required is freedom from the international restrictions which at present hamper air transport.

The progenitors of the present national transport company—Imperial Airways, Ltd.—were aircraft constructors, who, after the War, founded companies which started operations and ran services without subsidy on the routes London-Paris, London-Brussels and London-Amsterdam. They were Mr. Handley Page, who founded Handley Page Transport, Ltd., and Mr. G. Holt Thomas (founder of the Aircraft Manufacturing Co., Ltd.), whose transport company was Air Transport and Travel, Ltd. The system of subsidies introduced by the French Government made commercial competition economically impossible, and eventually, after a British Government committee had reported, the then existing companies were merged in Imperial Airways, Ltd. Pioneer work in Africa was done by another constructor, Mr. Blackburn.

The society would add that it does not approve of the system of subsidies. It would prefer a system of payment for services rendered, e.g. for carriage of mails.

Mr. McKinnon Wood has suggested³⁸ that nationalisation of production—apparently both of civil and military aircraft—should be worked into a scheme for the nationalisation of motor cars as public air transport should be worked into a unified national transport system. Since, however, Mr. McKinnon Wood does not deal with this scheme in his evidence, the society does not propose to comment on it.

The society has done a great deal of work in connection with civil aviation and has done whatever it could to develop it. The society has, as stated in the beginning of the memorandum, an air transport section which brings together the companies engaged in that business, and it formed an aerodrome owners section covering owners of private and municipal aerodromes.

XIV.

A memorandum of this kind cannot deal with every detail of the evidence already given before the Commission. For example, the statement³⁹ that the present indirect control of the industry by the Air Ministry is most ineffective and leads to inefficiency; and there are many other statements more or less to the same effect. The society submits that these statements—which are only matters of opinion unsupported by a shred of fact—are answered by the machines with which the Royal Air Force is equipped.

³⁷ Minutes of Evidence, 10th Day, p. 248.

³⁸ Aircraft Manufacture (published by New Fabian Research Bureau), p. 18.

³⁹ Minutes of Evidence, 7th and 8th Days, p. 214.

XV.

The Secretary of State for Air has recently stated⁴⁰ that the price paid for defence should be regarded as a premium paid for peace. The industry prefers to regard its efforts in that light, but however that may be—and it must be a matter of opinion—there is no half-way house between efficiency and inefficiency.

The history of the War shows that reliance on state design nearly led to disaster and that when state design and control broke down it was the farsightedness of private enterprise which saved the situation. Reversion to state design or control in an industry which is obliged by progress in design and knowledge to cope with increasingly complex problems would be a retrograde step and would gravely impair the air potentialities of the country.

XVI.

Although the Royal Air Force needs no testimonial from the society it would be ungracious not to record the admiration of the industry for the personnel of the Force which it is the privilege of the industry to equip.

XVII.

Certain allegations have been made with which the society must deal.

It is stated⁴¹ that the vested air armament interest has, by means of a long period campaign of propaganda, succeeded in leading the organised air interests of the country to believe that the policy of air disarmament is foolish, impracticable, and detrimental to British interests. This complaint is mainly based on the statement⁴² that the aircraft industry supports certain trade journals by advertising in them. The industry does advertise in these trade journals and is quite prepared to believe that without these advertisements the trade journals could not survive. In fact, however, the industry deprecates publication in a trade journal of matters which belong to the sphere of politics, a subject with which, in the opinion of the society, a trade journal should not deal, more particularly so in relation to international affairs. It is easy to say that the industry has the remedy in its own hands and could solve the problem by withholding advertising; but the solution is not so easy as that.

The society suggests that exaggerated importance is attached to this question of advertising. No public information is available as to the circulation of the journals in question, but it is thought that the circulation is not such as, in the opinion of the society, would materially influence general public opinion; while the suggestion that everybody, from the Air Minister downwards, would take his views on political matters from a trade journal cannot be accepted.

Mr. Noel Baker promised⁴³ to send to the Commission—if the Commission desired to see it—an advertisement which appeared in *The Aeroplane* of a machine "decorated with a swastika." He associated this with Germany, and complained that this advertisement appeared at a time when this country was still contesting the right of Germany to have an air force.

Examination of the actual advertisement would have shown that the word "Finland" appears right across the advertisement in one-inch capitals, and the advertisement records in bold lettering the sale of machines to Finland. The swastika used is the mark of the Finnish Air Force.

The next point is that there is "evidence of a financial connection between the private manufacturers and the Air League," this being based on a statement that Mr. Handley Page had offered £5,000 a year to the Air League for two years.⁴⁴

⁴⁰ The Times of 8th January, 1936.

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

The position is that the Air League had arrived at a point when reorganisation was essential. A committee of the Air League, under the chairmanship of Lord Burnham, was set up to investigate the position, the then Director of Civil Aviation being a member of the committee. The League had neglected the possibilities of civil aviation, a subject in which Mr. Handley Page (who, as stated above, was one of the pioneers of civil air transport) was keenly interested. He was approached on the subject of the Air League's financial position and, believing that there was room for the development of air transport and that the Air League might be able to do useful work, he undertook to raise funds if the League were reorganised. This was a personal effort by Mr. Handley Page to help the Air League out of its difficulties, though the initiative, as stated above, did not come from him. The promise of financial support was coupled with an undertaking that there would be no interference with the policy of the Air League. The fact that this offer of financial assistance had been made was published in the press at the time.

The industry has not sought to interfere in any way with the business of the Air League or to dictate its policy; and, though examination of the issue of the Air League bulletin in July, 1926, shows that the statement quoted in the evidence⁴⁵ is correctly quoted, the society can only say that it has no knowledge of the matter. This statement appears to have escaped attention by the society at the time, otherwise the society would have inquired into it. The Air League should not be in the opinion of the society have dealt with the subject, and if it did so at the suggestion of any aircraft constructor, the aircraft constructor was equally wrong in asking the Air League to concern itself with something which is outside the province of the Air League. The statement in the Air League bulletin is assumed to be correct; the society has no knowledge of it.

A further statement has been made⁴⁶ that the aircraft manufacturers "actually persuaded the Federation of British Industries to make a protest against internationalisation." No evidence is adduced to show that aircraft manufacturers had anything to do with the action of the Federation, but it appears to be assumed that because something was done in connection with aviation, the industry was necessarily behind it, an assumption against which the society protests. The facts are that, although the society is a member of the Federation, the Federation dealt with this matter on its own responsibility and without reference to the society. The first the society knew of the letter referred to was when a copy was sent to the society after it had been despatched.

XVIII.

The society will be glad to deal with any points on which the Commission desire information.

3605. *Professor Gutteridge*: Thank you very much. I do not think you need read the annexes.⁴⁷ We are much obliged to you. I am afraid you have had rather an arduous task. As I understand it, the Society approaches this matter from the point of view that you can divide the history of aviation into three periods—the pre-War period, the War period, the post-War period. That is so, is it not, Sir Robert?

Sir Robert McLean: That is so.

3606. *Professor Gutteridge*: I do not think we need go into the pre-War period or the War period at the moment, but as regards what one may call the post-War period I think your answer is that competition between the various services has gone. That is right, is it not? The army and navy are no longer in competition?

⁴⁵ Minutes of Evidence, 10th Day, p. 236.

⁴⁶ Minutes of Evidence, 10th Day, p. 249.

* See Appendix 1, p. 531.

Sir Robert McLean: That is right.

3607. *Professor Gutteridge*: Another feature, I think, is that the life of a plane began to be a matter of moment. I should imagine that during the War people were not so much concerned with the life of a plane as with getting a plane made quickly, but after the War the question became of more moment. Finally, I think you will agree with me that there was no organised system at the beginning of the post-War period. The industry emerged from the War in a somewhat chaotic condition?

Sir Robert McLean: That is so.

3608. *Professor Gutteridge*: Even at the present time, I think, the industry is in a somewhat fluid state, is it not? You cannot say that it has settled down even at the present time?

Sir Robert McLean: I think it is fair to say that it has settled down since the War. A certain number of constructors have consistently and continuously produced and designed aircraft and there have not been many additions in recent years.

3609. *Professor Gutteridge*: What I have in mind is this: one peculiarity of your industry at the present time seems to be that it is almost entirely dependent on government orders, and not only on government orders but orders from one department of the government.

Sir Robert McLean: I would say largely dependent. I think the export trade amounts to about 25 per cent.

3610. *Professor Gutteridge*: I am not quite clear in my mind as to the ground upon which you base your belief that it is inevitable that reliance should be placed on private industry. Do you consider that competition is necessary in the interest of design and efficiency?

Sir Robert McLean: I regard technical competition as being probably the most important element in the development of aircraft at the present moment.

3611. *Professor Gutteridge*: Some doubt has been expressed as to whether there is effective competition. I notice you use the words "technical competition"; but using "competition" in its fullest sense some doubt has been expressed, as I say, as to whether there is any really effective competition. As I understand it, firms do not compete against one another in the ordinary way for the supply of aircraft for the government.*

Sir Robert McLean: We tender our aircraft to be tested by the government one against the other. In some cases on the choice of one particular aircraft by the government an order is placed with the firm; in other cases there is competitive tender, 3612. *Professor Gutteridge*: That is the single order system?

Sir Robert McLean: Yes. And, of course, there is the machinery of the government available for the checking of prices.

3613. *Professor Gutteridge*: There is a technical costing system?

Sir Robert McLean: There is a technical costing system. They make their own investigation.

3614. *Professor Gutteridge*: Who makes the investigation—an accountant from the Air Ministry?

Sir Robert McLean: An accountant with technical officers who know the machinery of aircraft production.

3615. *Professor Gutteridge*: They both do it?

Sir Robert McLean: Yes, and they do it from drawings of the machines. They take the drawings and check them with their own estimate.

3616. *Professor Gutteridge*: Does the same system of tendering apply as in the case of, say, a warship for which rival firms will put in tenders?

Sir Robert McLean: No. In most cases where the machine is chosen only the constructor and designer is asked to tender for that machine.

3617. *Professor Gutteridge*: That, I think, is the ground for the suggestion that the competition which exists in this case is not quite the ordinary kind of

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

competition. As I understand, the Aircraft Establishment, or the Air Ministry—I am not sure which—produces a specification.

Sir Robert McLean: The Air Ministry.

3618. *Professor Gutteridge:* And that specification is sent out to a number of firms.

Sir Robert McLean: It is sent out to a number of firms.

3619. *Professor Gutteridge:* Then each of them prepares a design in accordance with that specification, and then, I take it, the Air Ministry decide which design shall be adopted.

Sir Robert McLean: Yes. The price is tendered when the firm puts in the design.

3620. *Professor Gutteridge:* The man who puts in the design gets the order to make it.

Sir Robert McLean: Yes, and the Air Ministry choose from those designs the one which they wish built, and the tenderer of the design, if he is selected, gets the order.

3621. *Professor Gutteridge:* The price is not one to tender; it is to design. That is why you use the words "technical competition"?

Sir Robert McLean: Yes. There may be more than one selected from the same class. You may have three or four machines built in this way; all competing in the same type.

3622. *Professor Gutteridge:* You mean that supposing I put in a design and the Air Ministry thought that mine was a good design, I might be asked to produce a machine, and other manufacturers might be asked to do the same?

Sir Robert McLean: And there would be competition in price in that case.

Mr. Fairey: Yes, certainly.

3623. *Professor Gutteridge:* The man who offered the lowest price would have a good chance of getting it?

Mr. Fairey: Yes. Just as we compete in the open market, tendering for existing machines to the design of other firms.

3624. *Sir Thomas Allen:* Would there be payment to the firm who submitted the design?

Mr. Fairey: If it is manufactured by other firms, a small royalty is paid.

3625. *Sir Thomas Allen:* Do you mean that the other firms manufacturing from the accepted design would have to pay the royalty?

Mr. Fairey: No, the royalty is paid by the Air Ministry. Of the other firms, the one who put in a competitive tender for the lowest price would get it. That also applies to equipment. A man may design a gun mounting and the Ministry will take from us the design with or without royalty, and put it up to open competition.

3626. *Professor Gutteridge:* What about engines?

Mr. Fairey: No, it does not apply in that case.

Sir Robert McLean: There are cases where the same type of machine is made by two constructors, and then there is competition.

3627. *Professor Gutteridge:* It is the same idea, but there are variations?

Sir Robert McLean: In the design of two different firms.

3628. *Professor Gutteridge:* I should like to know how far there is competition in the case of commercial aircraft. Is there a field of competition in the ordinary sense or not?

Mr. Fairey: Do you mean in the small private aeroplanes?

3629. *Professor Gutteridge:* First of all, as I understand it, with regard to large commercial aircraft you have only one customer?

Mr. Fairey: Imperial Airways.

3630. *Professor Gutteridge:* There can be no competition there?

Mr. Fairey: The position is similar to that which obtains in regard to the Air Ministry.

3631. *Professor Gutteridge:* I am speaking of the light aeroplane.

Mr. Fairey: There is very intensive competition.

3632. *Professor Gutteridge:* Is there a firm in this country which confines itself entirely to the manufacture of commercial aircraft?

Mr. Fairey: Quite a number. De Havilland, chiefly—I should say not entirely. They manufacture a very great proportion of civil aircraft.

3633. *Professor Gutteridge:* I would like to ask you some questions about competition in the export trade. It has been suggested to us that you cannot have any competition in the export trade in the full sense because you are not allowed to export machines—at all events, military machines—unless they are at least five years out of date. Is that correct?

Mr. Fairey: No. The exact contrary is the case. Speaking for my own company, 50 to 90 per cent. of our machines are not out of date and are not machines used by the government.

3634. *Professor Gutteridge:* Are they military machines?

Mr. Fairey: They are military machines, entirely up to date, and they are exported with full knowledge and consent of the Air Ministry.

3635. *Professor Gutteridge:* You have to get the permission of the government in the form of a licence for that, do you not?

Mr. Fairey: Every single machine, every bit of equipment, is exported with the full knowledge and consent of the Air Ministry. We frequently have to refuse to take orders when we have practically negotiated them, because we are told not to do so by the Air Ministry. We are also told when we are welcome to take foreign orders by the Air Ministry.

3636. *Professor Gutteridge:* I do not know whether you have the information or not, but it has been suggested that in one instance our government allowed a machine to be exported which was better than the ones produced at home. Have you heard anything of that?

Mr. Fairey: Yes, but different countries present different problems of aerial defence. The aerial defence of Moscow, which is situated hundreds of miles from the frontier, would be very different from that of a city like Brussels or London. It calls for the use of different types of aircraft and interceptors. My company has designed machines to provide for defence of both those countries—Russia and Belgium.

3637. *Professor Gutteridge:* You have supplied both countries?

Mr. Fairey: We are supplying them now. Naturally, it is not the same machine as would be produced for the British government. We gain experience in designing aircraft for different requirements, but the whole thing is done with the full knowledge and consent of the British Air Ministry. No machines are exported without their consent.

3638. *Professor Gutteridge:* Are we to understand that the type of machine which is required for export may depend on geographical conditions?

Mr. Fairey: Very much so, in the case of military aircraft and civil aircraft.

3639. *Professor Gutteridge:* I do not know whether you can tell us anything about the export of aircraft to Germany. It has been said that a considerable number of aircraft have been exported to Germany by—I think the Bristol Company.

Mr. Fairey: I have never heard of it. A certain number of engines were exported.

Mr. Allen: The Bristol Company have never exported aircraft to Germany.

3640. *Professor Gutteridge:* But engines were exported?

Mr. Allen: Yes, by two companies—Rolls-Royce and Armstrong-Siddeley.

3641. *Professor Gutteridge:* Rolls-Royce and Armstrong-Siddeley both exported?

Mr. Allen: Yes, with the approval of the Air Ministry.

3642. *Dame Rachel Crowdy:* Is the Bristol Company represented on your delegation?

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

Mr. Allen: No, a representative of the Bristol Company is not here to-day.

3643. Professor Gutteridge: I think Armstrong-Siddeley is represented?

Mr. Allen: Yes.

3644. Professor Gutteridge: This leads me to the question of the licensing system. It is a matter of some importance to us. As I understand it, a licence is required for military aircraft?

Mr. Fairey: Yes. For any aircraft fitted with military equipment.

3645. Professor Gutteridge: What do you mean by "military equipment"?

Mr. Fairey: Bomb gear, gun mountings, bomb sights.

3646. Professor Gutteridge: It need not actually have the gun on it?

Mr. Fairey: No. The Ministry require a licence if we have the fixtures.

3647. Professor Gutteridge: You mean if you have the slots provided, that would make it a military plane?

Mr. Fairey: That would make it a military plane, or the sockets for gun mountings. The Ministry control extends very much farther than that exerted by the licence. All our firms are on an approved list and if we were to displease the Ministry we should be removed and we should lose the other 75 per cent. of our trade. The Ministry have informed us that they have authority under the Official Secrets and other Acts to put a complete embargo on export, and we make no move without their permission. We are in very close touch with the Ministry. We inform them when negotiations are reaching a point when we expect an order and we ask them whether we may proceed.

3648. Professor Gutteridge: Before you accept the order?

Mr. Fairey: Yes.

3649. Professor Gutteridge: That system applies before you accept orders from abroad?

Mr. Fairey: Yes.

3650. Professor Gutteridge: Does that apply purely to military aircraft?

Mr. Fairey: Purely to military aircraft. That is the system which applies, and no aircraft is exportable without permission.

3651. Professor Gutteridge: Commercial or otherwise?

Mr. Fairey: I will not say commercial.

3652. Professor Gutteridge: Would you approve a system which gave publicity to those orders which you receive from abroad?

Mr. Fairey: Not after we had negotiated the contract. It might not be advisable before that, for commercial reasons.

3653. Professor Gutteridge: Suppose you had an order from, let us say, Ruritania, for so many military aircraft: It has been suggested that you ought at once to notify the relevant government authority of the receipt of that order and that the fact that you have received the order should be made public in some way or other, so that other countries should know what had happened.

Mr. Fairey: In one respect we are in advance of that, because we inform the British government before the receipt of the order, but as to informing the world, that is another matter.

3654. Professor Gutteridge: It would not make customers shy of coming to you, as some of the armament people seem to think?

Mr. Fairey: It might, but there are so many things that make people shy of us—for instance, when we have to refuse an order because the Air Ministry say we should not take it. We have been refused permission to supply an old customer during a political emergency.

3655. Professor Gutteridge: Would it be possible for military aircraft to be flown out of this country without its coming to the knowledge of the authorities?

Mr. Fairey: Not at all. All our activities go on under the eyes of the authorities. We have resident inspectors, visiting officials, and so on. The whole of our activities are completely under the eye of the authorities. There is not a vestige of an aeroplane or aeroplane equipment that could be sold without their knowledge.

3656. Professor Gutteridge: We should like to have the views of you gentlemen as to how far it is possible to convert the commercial aircraft into military aircraft.

Mr. Fairey: It is a question of relationship. There is no relation between an intercepting fighter—

3657. Professor Gutteridge: Will you tell me what an intercepting fighter is?

Mr. Fairey: A type intended to climb rapidly and intercept a bombing plane. The design of a high speed long range bomber approximates in type to the long distance passenger machine, for example, the Martin and Douglas in America.

3658. Professor Gutteridge: Do I understand you to say that the long range bombing machine is approximate in type to the long distance passenger machine?

Mr. Fairey: Yes. It has already reached a point at which you only have to instal bomb gear and some form of defence.

3659. Professor Gutteridge: Can you do that without making a good many structural additions?

Mr. Fairey: The original barrier was the safety factor. That barrier has disappeared owing to modern conditions.

3660. Professor Gutteridge: When that point is reached I suppose a long range passenger machine could be converted safely and quickly into a bombing machine. Therefore, those people who say that commercial aircraft can be used for long range bombing are not far out?

Mr. Fairey: No, and if you abolish military aircraft, as has also been suggested, you make the civil machine a complete bomber.

3661. Professor Gutteridge: I suppose you mean that as long as you have fighting aircraft you have to escort these long range bombers?

Mr. Fairey: Or defend them.

3662. Professor Gutteridge: Therefore, if you do away with military aircraft, your long range passenger machine becomes a much greater potential danger than it is now?

Mr. Fairey: Very much.

3663. Professor Gutteridge: That is a point that I do not think has been put before us. May I ask one other question with regard to the matter of export. It has been said that the exports—as I understand it, of military machines—are mostly to smaller countries—apparently including China. I do not know whether that description is correct. You have given us one instance of a big country—Russia.

Mr. Fairey: The industry exports practically to all countries apart from those countries which produce aircraft themselves—the great powers. The industry does not export to France, Germany or Italy, and not to any considerable scale to Russia; only on a small scale to Russia. Generally speaking, the export is to the smaller non-producing countries.

3664. Professor Gutteridge: Would you say that the great bulk of the export is to the non-producing countries?

Mr. Fairey: Yes. Many of those smaller countries, I could mention half-a-dozen, have national aircraft factories and they buy British designs and reproduce them in those national factories. The national factories inevitably fall behind the private factories in design. They start off with these national factories very gaily, but owing to the natural defect of government factories they fall behind.

3665. Professor Gutteridge: You believe the government factories tend to stereotype things?

Mr. Fairey: Yes. The government service does not attract the right type of man for production. We want the alert type, and the government service is apt to attract the safety-first type of individual.

3666. *Professor Gutteridge:* That is a matter of opinion, is it not?

Mr. Fairey: Entirely.

3667. *Professor Gutteridge:* There is one other point on which I would like to question you. That is with regard to research. If I may take it quite broadly, your industry has been attacked on the ground that it does not do research, or at all events, enough research. I would like to hear what you gentlemen have to say about that? Who is the proper person to whom to address that question?

Mr. Fairey: Mr. Handley Page.

Mr. Handley Page: I think the industry in relation to its output probably does more research than other industries.

3668. *Professor Gutteridge:* In other words, you dispute that statement?

Mr. Handley Page: Very much so; because the ratio of new experimental work done in the industry in relation to production I should think is higher than that in almost any other industry.

3669. *Professor Gutteridge:* It has also been suggested that your design is too much spread about; that there are too many drawing offices. I think that was the way it was put to us.

Mr. Handley Page: I think that was Mr. McKinnon Wood's comment.

3670. *Professor Gutteridge:* He said that.

Mr. Handley Page: He said that, as a rule, designs were given out to four or five firms and that there would be an improvement if the number were cut down. At the same time, when dealing with a scheme of state design and manufacture he suggested that there should be competition between different state factories. I do not know how much one can reduce four or five and still maintain competition. It seemed to me that it was rather a contradiction in terms.

Professor Gutteridge: I follow your meaning.

3671. *Sir Philip Gibbs:* I think, having read the original statement, nobody can challenge the enormous service that has been rendered by private enterprise in aviation; but going back a little to the first part of your statement, would you agree that the situation which arose at the beginning of the War was entirely due to the fact that, up to that moment, the aircraft industry had been entirely devoted to the civil aviation side?

Mr. Fairey: Oh, no.

3672. *Sir Philip Gibbs:* You would not agree to that?

Mr. Fairey: Scarcely at all. The situation before the War was this, that whereas the War Office were concentrating all their design and production at Farnborough—or nearly all—we in the private industry owed our existence to the Admiralty. The Admiralty pursued the exactly opposite policy and were keeping us alive by issuing orders and buying aircraft as we produced them, and they usually added a small percentage to everything they required in regard to speed and load next time they gave an order. It was the Admiralty policy before the War which accounted for the existence of the bulk of the aircraft industry and that provided the very efficient machines that were made available to replace the B.E. when it was outclassed by the Fokker.

3673. *Sir Philip Gibbs:* According to my recollection, aviation was in a very experimental and elementary stage up to the year 1913, and therefore it was impossible to produce a very expert type of fighting machine at the beginning of the War. We had not the experience.

Mr. Fairey: We were making machines with machine-gun mountings. I was with Short Brothers in those days; we made and delivered machines carrying a 5-pounder gun of heavy calibre at Calshot. That was before the War. We had developed the

machine to a considerable extent at Short Brothers. 3674. *Sir Philip Gibbs:* Was there in existence in private industry any machine which could have countered the Fokker at that time?

Mr. Fairey: Yes, the Sopwith Tabloid.

3675. *Sir Philip Gibbs:* You think they were of equal fighting quality with the Fokker?

Mr. Fairey: They were not in production, but the designs were equal. There were one or two in existence which the Admiralty bought.

3676. *Sir Philip Gibbs:* With the old B.E. machines was it possible to produce by private industry a machine which could have countered the Fokker very rapidly?

Mr. Fairey: Yes. The Fokker was only a copy of the Morane. It was what they called a parasol monoplane.

3677. *Sir Philip Gibbs:* Would you agree that the differentiation between civil types of aircraft and military machines is becoming more intense, more divergent?

Mr. Fairey: It is a matter of opinion, but I suggest that certain classes of military aircraft and certain types of commercial machines are coming more together. That is an expression of my own opinion; others might not agree with me.

Mr. Handley Page: I think it very largely depends on whether the defensive property of an aeroplane lies in its speed or in its armament. If you consider that the war defence of a large aeroplane is to be its speed and its ability to get away, then the methods of defence, and the provision of means of defence, not required in commercial aircraft, are equally not required in military aircraft. 3678. *Sir Philip Gibbs:* I am not talking of bombers; I am talking of fighting machines.

Mr. Handley Page: I was dealing with the case where, as Mr. Fairey pointed out, the design of certain high speed machines in civil and military classes tends to become alike, where speed is the sole consideration. If, however, the sole reason for the machine is a matter of the provision of guns, and the essential basis of a commercial machine is comfort to the passenger, then there must be a differentiation between the two.

3679. *Sir Philip Gibbs:* May I ask one of you gentlemen what you think is the exact purpose and usefulness of the National Physical Laboratory and the Royal Aircraft Establishment with regard to private industry?

Mr. Handley Page: The National Physical Laboratory in relation to the aircraft industry serves very much the same purpose as it does in regard to other industries, or the purpose that university establishments serve to other industries; it provides all the material from which text books are drawn up, all the data, and so forth. The universities undertake, for example, in other spheres, research work as to the lubrication of bearings, and from that fundamental data is drawn up.

3680. *Sir Philip Gibbs:* Is it actually useful to you?

Mr. Handley Page: Very useful, and also the Aeronautical Research Committee is a means for fundamental research. Other countries have adopted the same procedure. There is a National Advisory Committee for aeronautics in America which I think has followed the model here, and the Germans have a similar organisation.

3681. *Sir Philip Gibbs:* And with regard to the Royal Aircraft Establishment, what does that do? Does it do anything with regard to research?

Mr. Handley Page: It does research in the same way: very useful research. In addition, it does research in regard to particular technical problems with which the fighting services are concerned. It does research into ballistics; it does research into bombs; research into sights and other things, similar to the way in which it is done, I expect, by the research department at Woolwich for the army, and at other establishments for the navy.

3682. *Sir Philip Gibbs:* I want to mention a fact which is perhaps well known to you, that those two

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

establishments are paid for by the nation. The next question I want to ask you is this: Are you not receiving, in your private industry, which you conduct for profit motives apparently, a considerable amount of useful information from government sources?

Mr. Handley Page: I suppose we receive an enormous amount of accumulated wealth from a number of sources. I suppose, for example, a writer, if I might say so, draws on the accumulated literary experience from Shakespeare downwards.

3683. *Sir Philip Gibbs:* Yes; but, of course, the taxpayer does not pay any royalties to Shakespeare.

Mr. Handley Page: That may be true; but in the case of the aircraft industry we also draw a great deal on the research work that is done, for example, at Cambridge University, work that is done at London University, and elsewhere; private research work. We draw, similarly, on an enormous wealth of accumulated fundamental research from America, to which the taxpayer here at the moment does not make any contribution.

3684. *Sir Philip Gibbs:* He is escaping that.

Mr. Handley Page: And we draw from Japan, where they have a similar research organisation; but the information that you do not get is, of course, that which the designer has when he gets out the design of the machine.

3685. *Sir Philip Gibbs:* That I fully understand.

Mr. Fairey: I wonder if Mr. Handley Page will excuse me if I add that if we utilise the resources of the National Physical Laboratory for that purpose, we pay for them.

3686. *Sir Philip Gibbs:* Surely you do not pay for the pure science that is derived from the National Physical Laboratory?

Mr. Fairey: We would in so far as that is passed on to us through the medium of the people who are helping us. If we hire a tank for a day, we get Professor Baker's expert knowledge.

3687. *Sir Philip Gibbs:* I think that is a pretty cheap rate to pay for scientific knowledge. Hiring a tank for a day does not pay the government for keeping the National Physical Laboratory.

Mr. Fairey: There are two ways by which we can get it. The government can give us an order by which the work is done at the National Physical Laboratory, or at Farnborough. If we want the knowledge, we have to pay them for it in the same way that any electrical manufacturer can go to the National Physical Laboratory and have a condenser calibrated.

3688. *Professor Gutteridge:* A private individual can do that?

Mr. Fairey: Yes.

Mr. Handley Page: Anybody can have that done, on payment of the fee. In the aircraft industry it has become a matter of national prestige associated with national supremacy. The country has set up institutions for fundamental research, and the little that has been done in this country is a mere drop in the ocean compared with the enormous organisation which at the present time exists under the National Advisory Committee for Aeronautics in America. The National Advisory Committee for Aeronautics is directly responsible to the President. The German institution is an enormous one. The Japanese is another.

3689. *Professor Gutteridge:* Do you suggest that we are behindhand in research?

Mr. Handley Page: No. I am suggesting that the money allocated in this country for that purpose is not so great as that which is allocated abroad. I think the point is this. In connection with this whole sphere of aeronautics it has to be recognised that fundamental research is essential if the art is to progress. Every country is engaged on fundamental research of this character in this particular industry. In the more slowly progressing industries, where the rate of technical progress is slower, it has been left more to the universities to do this kind of work. It is essentially fundamental and basic

research. And, of course, there is another thing which influences the Treasury department of every country when agreeing to this expenditure, and that is this. Supposing you were to cut out altogether fundamental research, to do no fundamental research whatever, and were merely to ask every manufacturer supplying aeroplanes to supply them without that fundamental research being undertaken, presumably the overhead charges of the manufacturer would go up, because each one would set up his own research station, and the price to the client would have to be correspondingly increased.

3690. *Sir Philip Gibbs:* I strongly appreciate that; but I am driving to an argument which I would like you to counter; that is, that you are putting up a very steady defence for private industry against any form of national manufacture. Therefore I am trying to obtain an admission from you that you are receiving benefit from the state which you are using for private profit purposes.

Mr. Handley Page: I am not so sure about the benefit sometimes. For example, we own the patent of a thing called the slotted wing, and when the government do some of the detailed research work upon that in their own establishment and publish the results, as they do, to the whole world, we are not the only recipients. Every Tom, Dick and Harry abroad will get that information, and when they publish the details, the people who are far away, and whom we cannot get at, and who have no patent, have all those things supplied to them free of charge, whereas sometimes nobody in this country, not even the poor patentee, gets the benefit. So I am not sure that the Research Department is always of benefit to us.

Mr. Fairey: We pay for those researches when we use them for our own purposes; it is only when we use them for Air Ministry contracts that we get them free. We can hire a tank, or a tunnel, at so much a day. The scale of charges is high. I think it costs about £90 a day to hire a tank, and that, of course, is rather high.

3691. *Sir Philip Gibbs:* One definite case has been cited by witnesses whom we have heard. They stated that the Bristol engine was very largely dependent upon cylinders made at Farnborough. It seems to me, therefore, that the fee that might be paid by you does not really cover the services rendered by scientific invention?

Mr. Allen: Of course, you are not assuming that the statement is correct?

3692. *Sir Philip Gibbs:* I am not assuming that it is correct. I am asking you.

Mr. Allen: I have made the closest investigation with the Bristol Company and the statement is absolutely untrue. There is not a shred of fact to support it.

Colonel Fell: I was in charge of the department responsible at the Air Ministry at the time that work was done, and while certain experiments were carried out in which naturally the Bristol Company were interested, it would not be fair to state that those cylinders used in the Bristol engine bore any resemblance.

3693. *Sir Philip Gibbs:* You suggested that the world benefited considerably by this expansion of scientific knowledge and new invention. I rather want to put it to you that so far from benefiting by the increased efficiency of aircraft we may be creating a high state of danger for ourselves and rushing towards the destruction of civilisation. Undoubtedly the present Prime Minister is rather anxious about that. It is rather theoretical, but the question I want to ask you is this: Do you think it is dangerous to this country that patents for new designs should be sold to any country in the world which likes to buy them?

Mr. Handley Page: Do you mean by "patents" actual patents?

3694. *Sir Philip Gibbs:* For fighting machines and bombing aeroplanes.

Mr. Handley Page: Do you mean patents or designs?

3695. *Sir Philip Gibbs:* I mean patents for designs.

Mr. Handley Page: After all, you can only sell what exists in a country abroad. You can only sell to France, we will say, a patent which exists in France, and a patent is supposed completely to disclose all the means by which the invention is secured. Therefore, a country has within its own territory all the information fully disclosed in the government publications. If you mean that—

3696. *Sir Philip Gibbs:* Might I interrupt you for a second? Surely the knowledge of that design is not known until the patent is sold?

Mr. Handley Page: May I point out that you cannot have a patent to sell in a country until you have got the patent. The essential feature of the patent is that the patentee, in consideration of a monopoly for a term of years, discloses his invention.

3697. *Sir Philip Gibbs:* Yes.

Mr. Handley Page: The patent is granted in a foreign country, and not until it is granted is the patentee in a position to deal with it. The state in whose territory the patent is granted has the whole of the information disclosed with the patent, and if the person who grants the monopoly says at the same time "I am going to have the invention worked in this country under my own aegis whether you like it or not", it seems to me that the only thing the patentee can do is to obtain the maximum possible remuneration for the patent. The state in every country in the world has the right, with or without agreement with the inventor, to use any patent rights.

3698. *Professor Gutteridge:* It comes under the international system of patents?

Mr. Handley Page: It is the system everywhere.

Mr. Fairey: We cannot take out a patent without permission of the Air Ministry. Directly we file it it comes under the eye of that department. We cannot get foreign patents without permission of the Air Ministry. It is just the same as exporting aircraft.

Mr. Handley Page: Take our slotted wing patent which we have in every country in the world. When those patents are granted in a country like France, for instance, there is full disclosure of all the means by which the invention is secured. The French government, the French technical authorities, the French constructors are able to get from this country all the research results of the Aeronautical Research Committee which are published by the Stationery Office at 6d., 1s., or 1s. 6d., according to the size of the document. Therefore, they are in possession of everything. I think it would be foolish from a financial point of view not to endeavour to extract, perhaps with great difficulty, some compensation from the government concerned who have the patent.

3699. *Sir Philip Gibbs:* Yes, but surely some of your inventions apply to what I may call military gadgets for the improvement of the fighting qualities of the machine or its bombing possibilities?

Mr. Handley Page: We are not allowed to take out any foreign patent if it is regarded as essential for the defence of the realm under the Official Secrets Act that it should be kept secret. It is only when it has become probably of no special utility to this country that we are allowed to take out a patent abroad. But equally, when that patent has been obtained, the government of that country can use it, whether you agree to it or whether you do not.

3700. *Sir Philip Gibbs:* It just bags it?

Mr. Handley Page: Yes. The same hand that has granted you the monopoly can take it back.

3701. *Professor Gutteridge:* A full specification has to be filed?

Mr. Handley Page: Yes, and as you will know, unless there is complete disclosure the patent can be declared invalid for either ambiguity or lack of subject matter.

3702. *Sir Philip Gibbs:* Am I right in saying that when you submit types of new military machines to governments you might submit four or five types which are very similar and which differ only in perhaps small detail?

Mr. Handley Page: Four or five different firms might do so.

3703. *Sir Philip Gibbs:* And that when one type has been accepted by the government the other types are liberated for sale abroad?

Mr. Handley Page: Yes. There may not be one type only, there may be two types chosen to fulfil a given purpose. To fulfil a given condition, an aeroplane may in one case have a certain combination of features which leave out a very good feature which, in another combination, produces an equally good machine, perhaps with a little better characteristic in the other direction. Two types are chosen, and between those two types there will be intense and continuing competition, both in regard to price and in regard to technical qualities. Take the case of engines. There has been equally intense competition between the Armstrong-Siddeley air-cooled engine and the Bristol air-cooled engine. They have been like the Kilkenny cats, they have been at it all the time, both in regard to price and technical performance.

3704. *Sir Philip Gibbs:* Do you get any reciprocity in the way of information from foreign sources?

Mr. Handley Page: The American National Advisory Committee publish in exactly the same way reports on all the research work, and those reports are purchasable for a very small amount. Equally, the National Advisory Committee officials are always pleased to welcome you there and they will show you over their factories.

3705. *Sir Philip Gibbs:* What about the German firms and the Italian and other aircraft industries?

Mr. Handley Page: I have not been to Italy recently.

3706. *Sir Philip Gibbs:* Let us say Germany?

Mr. Handley Page: They held a conference about six months ago for which invitations were sent to quite a large number of people, and they took them round the German factories.

3707. *Sir Philip Gibbs:* Were you able to see anything of real importance?

Mr. Handley Page: I did not go myself; but some very interesting papers were published.

3708. *Sir Philip Gibbs:* I imagine a nation like Germany, which is preparing a rather extensive air fleet, would not allow you to see their research development?

Mr. Handley Page: In fundamental research work I think there is an extraordinarily great camaraderie in regard to air matters; it exists there more than anywhere else; but, of course, if you asked, say, Sir Herbert Austin whether he would allow Lord Nuffield to go round his experimental departments and inspect next year's models, I think probably the answer would be in the negative; similarly, if I asked another manufacturer in this country whether he would allow me to walk round his experimental department, I should be very pleased to do it, but I am not sure that I should receive any more friendly reply to my request if I made it over here than I should receive if I made it in Germany. I do not think it has anything to do with politics. Mr. Allen reminds me that the Society of British Aircraft Constructors publishes each year an international index of technical papers on aeronautics and that the latest issue contains a very large proportion of German information.

3709. *Sir Philip Gibbs:* You used a rather good phrase a moment ago, that was, "the camaraderie in the international aircraft industry." May I suggest to you that this camaraderie, which no doubt exists as you have already said, of what I might

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

call an international collaboration of scientific knowledge and of friendly competition in efficiency of design and fighting qualities, is extremely interesting to the international aircraft industry, but is extremely dangerous to the peoples of the world?

Mr. Handley Page: No. There you go one stage further. I did not say international camaraderie in regard to fighting matters. That is quite different. I am referring to those who are engaged in something which is very new, something that depends on a new science in which basic problems are being studied, in which we are drawing up really the basis of future text-books to deal with this kind of thing, on which collective information does not exist. You will find that in regard to problems of air flow, size of bodies, questions of propeller design and so forth, everybody meets and discusses these questions with the utmost freedom. There is no question of difference of nationality. One is much more interested in—if I might call it—the common fight, in finding out new things. It is the common fight against nature. On the other hand, when it comes down to a question of commercialism, I must say I do not think that exists. When it comes down to private flying there is a camaraderie comparable with that of the sea. Every pilot knows the dangers he has to face—flying in fog, and a hundred and one things. I do not think that has anything to do with the commercial aspect of the situation.

3710. *Professor Gutteridge:* I suppose an aircraft constructor is on one side a business man and on the other side a scientific man?

Mr. Handley Page: "Each man in his time plays many parts".

3711. *Sir Philip Gibbs:* I am rather pressing the argument on this point, because, of course, it is of very great importance. It has already been stated by one of you gentlemen that a considerable number of engines of the most efficient type and suitable, I think, for fighting aeroplanes, were sold to Germany.

Mr. Allen: I do not think we said that the latest types were more particularly efficient.

3712. *Sir Philip Gibbs:* I understand they were all of the latest type.

Mr. Allen: In fact they were not.

Mr. Handley Page: They are of a type that has not been supplied to the British government.

Mr. Fairey: It was done with the full knowledge of the British government.

Colonel Fell: Those engines were not of the types that have been supplied to the British government.

3713. *Sir Philip Gibbs:* They are a good type of engine?

Colonel Fell: Quite a good engine.

3714. *Sir Philip Gibbs:* They were really more than quite good engines, were they not?

Colonel Fell: I should say they represented contemporary practice. They would not do more than that.

3715. *Sir Philip Gibbs:* I think they were the latest and most powerful type of engine that you could produce, were they not?

Colonel Fell: No.

3716. *Sir Philip Gibbs:* Or that you had produced?

Colonel Fell: They represented probably a 3-year old standard at the time they were sold.

3717. *Professor Gutteridge:* Does that mean three years out of date?

Colonel Fell: No—three years from the time they came in.

3718. *Sir Philip Gibbs:* The question I wanted to ask was this. I was wondering whether I should ask it of Sir Robert McLean. Do you think it is good from the point of view of your associated industry to sell engines to a power like Germany, which is building up a great aircraft fleet which might be a menace to us, and that having done so, with full permission of the government, and a certain terror takes possession of the English people, its politicians should then go to Parliament to ask for large sums

of money to increase our air fleet against that menace? That is rather a long sentence. I am sorry. Can you answer that?

Sir Robert McLean: I must assume that if the government, in its sovereign discretion, sees no objection to my selling engines to Germany, then there is no objection, moral or political.

3719. *Sir Philip Gibbs:* You put your conscience entirely in the hands of the British government?

Sir Robert McLean: The established government.

Mr. Fairey: They must take the responsibility.

3720. *Sir Philip Gibbs:* I quite admit the responsibility goes directly to them.

Mr. Fairey: As it would in a nationalised industry. They would be in exactly the same position.

3721. *Professor Gutteridge:* I was wondering, if you abolished the private manufacture of aeroplanes, whether you would still have that control.

Mr. Fairey: You would still have exactly the same control of export as you have now in these matters. Possibly you would not have such good engines to export, or aircraft.

3722. *Sir Philip Gibbs:* That question that I have asked is a question that has to be answered not only by you, or by the British government, but by the nation. Now I want to switch off to another line, and that is this: Do you think it would be possible to draw a dividing line between civil aviation and military aviation and that, without great damage to your industry, government should control the military end of your production?

Mr. Fairey: It does control the military end of our production.

3723. *Sir Philip Gibbs:* That is to say, that it should actually establish a state monopoly over the military end of your production?

Mr. Fairey: Of manufacture?

3724. *Sir Philip Gibbs:* Yes.

Mr. Fairey: You mean the government should manufacture military aircraft and we should manufacture civil aircraft?

3725. *Sir Philip Gibbs:* Yes.

Mr. Fairey: Our case is this, that the government cannot manufacture efficient military aircraft. It has tried and has failed. It has been tried in other countries, and those countries have had to have resort to our private designs. Our case for private manufacture is that it secures efficiency.

3726. *Sir Philip Gibbs:* Do you make any divorce between your service to the state and your service to private enterprise—that is to say, would not your brains and your genius be at the service of the state if the state asked for it?

Mr. Fairey: You mean if we were purely civil-aircraft manufacturers?

3727. *Sir Philip Gibbs:* Yes.

Mr. Fairey: But we should then be such feeble concerns, making merely wooden aircraft, that we would not maintain the experimental research work that we have to maintain for making government aircraft. Our brains and our resources would be at the government's disposal, but they would have no backing behind them worthy of the name for manufacture and research.

3728. *Sir Philip Gibbs:* I can visualise the idea that the government should actually take over your factories and pay you accordingly.

Mr. Fairey: To what end? To run it?

3729. *Sir Philip Gibbs:* Yes, to control it.

Mr. Fairey: They do control it now. Do you mean, to replace our present boards of directors by government officials?

3730. *Sir Philip Gibbs:* I think it might amount to very much the same thing, except that you would be directly manufacturing for the state instead of for private profit; and may I suggest, Mr. Handley Page, that, after all, the main bulk of your business is for the state at the present time.

Mr. Handley Page: And of course the factories, under government control, when nationalised,

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

would also deal with all new designs, as the private factories do now.

3731. *Sir Philip Gibbs*: Yes.

Mr. Handley Page: It would, of course, be a solution of the disarmament problem; because there would be little turned out.

3732. *Sir Philip Gibbs*: In some industries, like the chemical industry, they point to the fact that the enormous bulk of their business is for ordinary commercial purposes and, therefore, it would be impossible, they say, to nationalise that industry unless you nationalise every industry in the country. But with regard to this new aircraft industry it seems to me that it would be easy for the government to take over the aircraft industry, and that you would be working rather more for the state than you are at present, but not very much more.

Mr. Handley Page: Well, of course, if it could be done, and done successfully, if one were working wholly for the state, then in that case why not do it? The answer to it is, of course, that in the original days of 1911, or about that time, when Lord Haldane was War Minister, it was envisaged that the whole of the manufacture would take place at the Royal Aircraft Establishment—or the Royal Aircraft Factory, as it then was—and that design and manufacture would be conducted as in a government dockyard; but it has been found by development, not only in this country but everywhere else, that that policy leads to stagnation, because of the lack of the competitive element which I think even Mr. McKinnon Wood in his evidence says is so necessary; that when that competitive element is lacking we fall behind. The great instance was during the War, when the B.E.2.C., a government design, was completely outclassed by privately produced aircraft on the other side.

3733. *Sir Philip Gibbs*: I think it would be fair to say that owing to the elementary stage of aviation at that time compared with its position now, the government factories were not in the position in which they are to-day.

Mr. Handley Page: I think one has to remember all the time that it is not large numbers that are required, but high efficiency, and that it is much more important to have something in small quantities that is ten per cent. better than the opposite side, than large numbers of something that is only mediocre; and it is that terrible rate of technical progress that is called for all the time in developing aviation that you will never get in a nationalised system.

3734. *Professor Gutteridge*: One of our earlier witnesses put it in this way: that you have to be just in front of the other fellow.

Mr. Handley Page: You have to be a good deal in front of him; and inevitably, however much one may regret it or however much one may like it, the power lies with the country which has a great industrial potential due to its private industry. That applies not only to aircraft manufacture, it applies to the production of raw materials, the new alloys that have been referred to, bronze bearings for engines, duralumin in connection with bodies and wings of aeroplanes, the use of magnesium and some of its alloys, all of which is finding an outlet in commercial life. Then one knows the method by which motor cars are produced, and the hundred and one accessories required such as nuts, bolts, and rivets; they are all used for ancillary industries and it is only when you come to the specialised aircraft work that you find that you need to draw on all those industries if you are going to make progress.

Mr. Fairey: Sir Philip, you pointed out that the conditions during the war were different from what they are now, but there are now in the world many national aircraft factories, and they inevitably fall behind private enterprise in design. They come to us for new designs; they buy our designs for reproduction; they mostly come to England.

3735. *Sir Philip Gibbs*: Yes. I thought it was Sir Robert McLean who rather far back in our proceedings this morning said that the aircraft industry—I imagine he meant in design—was tending to stereotype itself.

Sir Robert McLean: Oh, no; rather the contrary.

3736. *Professor Gutteridge*: I think I said that even now the aircraft industry is in a somewhat fluid condition, and I understood you to say that it was settling down.

Sir Robert McLean: The industry. I thought Sir Philip meant not the industry but the art of design, and so on.

3737. *Sir Philip Gibbs*: I must say I was perhaps stressing the design part of the industry; but may I ask you this. Even in design is there not a kind of ultimate possibility; that is to say, can you go beyond a certain limit in speed and fighting efficiency?

Sir Robert McLean: I am not a technical man, but I have heard nobody who would say that we are anywhere near finality either in structure, aerodynamics or speed.

3738. *Sir Philip Gibbs*: The idea that I had in mind was this, that for war purposes it might be possible at this stage to standardise a machine which would be up to the highest level of efficiency.

Sir Robert McLean: It might be up to date to-day and out of date in a year's time, overpassed by some other development.

3739. *Sir Philip Gibbs*: I imagine that if some new crisis were to overtake this country and we had to develop our air fleet enormously, there would be an immediate attempt at standardisation of the best fighting types. Is that so?

Sir Robert McLean: I think they would go hand in hand. The most suitable design would be chosen, the numbers required would be ascertained, and development would continue.

Mr. Handley Page: One of our greatest difficulties in the industry is that even if you take a standard type it is always being modified, and if we were in the midst of a crisis, and unfortunately got into another war, you would find that the experience in the field would necessitate continual change in the aircraft. It is that essential flexibility of development which makes for progress and is only possible when it is being dealt with by people who are in intense competition each with the other.

3740. *Sir Philip Gibbs*: It seems to me, if I may say so with respect, that the present system is a little disorderly. In the present proposal of the government to increase the nation's military aircraft, there does not seem to me to be any order. Shall I say it is haphazard and is dependent on a variety of private businesses and on a variety of designs which are constantly changing, and therefore the government seem dependent upon what I should call a slight anarchy in the situation.

Mr. Handley Page: Does not that mean, in effect, that the government has no fundamental policy?

3741. *Sir Philip Gibbs*: Yes, I think it does mean that.

Mr. Handley Page: I do not think that we as aircraft constructors can be held responsible for that, if it were true; but I do not think it is true; far from it. Really, this has nothing to do with us. 3742. *Sir Philip Gibbs*: It has this to do with you. We have to decide, or at any rate to suggest, whether any alternative system is possible; therefore it does affect you.

Mr. Handley Page: But in this respect the Royal Air Force is a fighting service which has various branches of its arm, and equipment is allotted to its respective branches. Just as in the Army you have infantry, cavalry, and so on, so in the scheme of the Air Force there are different ranges of machines, proceeding from the small

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

fighters up to the big bombers, and there is, without doubt, a correlated policy between the different branches as to how many of each kind will be required, when they shall be replaced, and by which type they shall be replaced as they rapidly become obsolete. Then in the scheme of replenishment of the Air Force there is a considered policy whereby certain firms are making certain aircraft in competitive tender and are providing the Air Force with those aircraft. I do not see that you can call that anarchy.

3743. *Sir Philip Gibbs*: I felt in my own mind that if there had been some government manufacture in what is, after all, a new business, it might have been easier to co-ordinate and might have produced more efficient results in the way of fighting machines.

Mr. Handley Page: I very much doubt that, because if you want to make quick progress—that is, if you want to have machines which are more efficient than your competitors—then you must make quick decisions in the various stages, and you will never get that quick decision from a committee controlling a nationalised industry.

3744. *Sir Philip Gibbs*: I am afraid I have asked too many questions, but may I ask two or three more of an entirely different character. As you are aware—indeed, you have already noted—there has been a considerable amount of criticism, and perhaps even abuse, of the private aircraft industry from some of our witnesses and from the outside public. I think the main charges which are made against you are that you are all acting together in a kind of friendly arrangement—

Mr. Fairey: Completely untrue!

3745. *Sir Philip Gibbs*: —in order to establish prices—

Mr. Fairey: Completely untrue!

3746. *Sir Philip Gibbs*: —with which you then face the government. That is one charge. May I enumerate two or three more. Secondly, that you, as a body of industrialists, endeavour to create terror in the public mind so that the government will be forced to give more orders to your firms. Thirdly, that you actually use political effort and efforts in private speeches against the policy of disarmament in order to increase your profits. Those are the charges—they are not personal charges of mine—that have been brought against you. With regard to one other charge, I believe Mr. Fairey has been pointed out as a “very dark criminal”.

Mr. Fairey: Shall I deal with that first. I am very glad that Sir Philip has raised it. That is the sort of thing which is said by witnesses in front of a Commission like this without any regard to facts and, whether intentionally or not, it creates prejudice.

3747. *Sir Philip Gibbs*: Yes.

Mr. Fairey: If that witness had made any effort to ascertain the true facts of the case he would have found that there had been an inquiry in Peru and that the charges were not true. Mr. Webster, a competitor, was alleged to have stated before the Nye Committee that we had charged 10,000 dollars more per machine, and that the equipment we supplied with our machine was inferior in the tests to the American machines, and that someone had received 100,000 dollars commission—that is, £20,000. The total contract was only £42,000. Immediately this charge was made, the Peruvian government instituted an inquiry, through the Ministry of Marine. They cabled to the Ambassadors in Washington and London to ascertain the facts, and the facts ascertained were these: that the net price of the aircraft we supplied was not 10,000 dollars more, but between 600 and 700 dollars less than the American; that no Peruvian official had received any payment, and that no tests had been made as between the two types of machine; in fact, the American ones were not delivered. All those facts were available; they were in the Peruvian press. Mr. Webster, becoming

aware of the investigation, sent the following cable to the Inspector General of Aviation in Peru on 14th September, 1934:

“Commandante Gilardi, Air Force Service, Lima. The versions published in the press regarding the Senate investigations are absolutely incorrect, unwarranted, and contain no vestige of truth of the evidence given. I am very sorry this has happened and I am preparing a sworn declaration which contains the true facts with reference to the Peruvian business. I am sure you will then be convinced that absolutely nothing has been said which would in any way reflect on the integrity of any Government official. It seems that for some political reason there is an attempt to ruin the industry. I trust that you will reserve your opinion until you obtain the exact and complete version”.

I do object to that sort of thing being cast before this Commission as if it were true.

3748. *Sir Philip Gibbs*: We are very willing to accept that statement.

Professor Gutteridge: No doubt you are very glad to have had an opportunity of making that statement.

Mr. Fairey: I am very glad, sir. My name has been bandied about in America and elsewhere. The other charge is that the *Daily Mirror* holds 4,000 of my shares. I cannot help that, but I know that the capitalisation of the *Daily Mirror* Newspapers is £2,200,000, so that their interest in aircraft is 0.18 per cent.

3749. *Sir Philip Gibbs*: In an interview with the *Daily Mail* you are said to have advocated a 400 per cent. increase in the Air Force reserve. That rather suggests to the mind of the critical public, perhaps, that the aircraft manufacturers are urging the nation to build up a very heavy air fleet.

Mr. Fairey: I am pointing out what I consider to be a technical error, that we have not enough reserves in proportion to the aircraft available. We are the only people who can point that out; the government officials cannot do it.

3750. *Sir Philip Gibbs*: I think that government officials ought to be able to do it.

Mr. Fairey: Not publicly.

3751. *Sir Philip Gibbs*: They ought to be able to decide that question.

Sir Robert McLean: I should like to deal with the first point that Sir Philip made with regard to the ring, co-operation or collusion in regard to prices, and that we were in fact authorised to hand in agreed prices to the government. There is not a word of truth in that. We are in the keenest technical competition; we are in the keenest commercial competition where competitive prices are asked for. Prices for any given type are not, nor have they ever been, agreed between us before a tender is placed. I am glad to be able to give a denial to that statement, because we always keep our proceedings entirely free from matters of that sort.

(Adjourned for a short time.)

On resuming:—

3752. *Sir Thomas Allen*: In section XIII of your statement,* you quote Lord Marley, who claimed, and was very insistent upon, the essential necessity of national production with regard to aeroplanes. I would like to say in that connection that Lord Marley, while he is an advocate of peace, was very insistent that with regard to the future we should not be left in the position that we were at the time of the last war. His point was that if war was a necessity we should be sure of being nationally equipped to the highest possible efficiency. I take it that in any scheme of national production in war time or in an emergency we should have greatly to increase the present output—one hundredfold, or

* See p. 515, *supra*.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

perhaps even more than that. What is your position with regard to quick expansion in war time as distinct from peace time?

Sir Robert McLean: That is a question that I think, with all deference, should be directed to government witnesses.

3753. *Professor Gutteridge:* I think it may involve questions of policy in regard to national defence, may it not?

Sir Robert McLean: We are not prepared to disclose figures on that point.

3754. *Sir Thomas Allen:* My point is that while in the last resort it is a question for the government, it would be interesting to know something about your capacity in an emergency.

Sir Robert McLean: I have no doubt they would give you all the figures that you desired as a Royal Commission.

3755. *Sir Thomas Allen:* Thank you. You told us this morning that with regard to aircraft we are up against a new science—which implies, of course, that the nation of the future to which flying is not a commonplace will be out of the running. You would agree with that, would you not? It has been put to us that because of that fact there is the clearest possible case for a system of state manufacture. Have you anything to say on that?

Sir Robert McLean: I think it is a mistake to divorce manufacture from invention and design. The state might conceivably manufacture a very large number of indifferent things. The technical supremacy is equally as important as the mere production of a bit of equipment. I would not be prepared to agree here and now that state manufacture is inevitably necessary to keep technique predominant. I should take the other view.

3756. *Sir Thomas Allen:* We have been told that the aircraft industry is very slightly connected with other industries. Can you tell us how far your ability to expand is dependent upon any other production in which you may be engaged?

Mr. Handley Page: I think it is interconnected at almost every stage, right from the raw material almost to the finished article.

Secretary: I do not think you caught the question. The question is how far your capacity for expansion is dependent upon your own activities in other kinds of production than military production. Is not that what you mean, Sir Thomas?

Sir Thomas Allen: Yes.

Sir Robert McLean: The ability to expand is a matter of the capacity of the various plants in the industry. In so far as you can, having regard to the number of shops and the number of employees, divert from civil to military work that is your capacity for expansion, but, as I have said, I think we are not entitled to put that into figures.

3757. *Sir Thomas Allen:* You have referred to raw materials. Have you any control over raw materials in any way, or do you manufacture any?

Sir Robert McLean: None whatever.

3758. *Sir Thomas Allen:* You are totally dependent on other manufacture than your own?

Sir Robert McLean: For raw material, yes.

3759. *Sir Thomas Allen:* We have been told again and again about the alleged want of collaboration between the Admiralty, the War Office and the Air Ministry. Is there anything that is still wanting with regard to air production in that direction? Do they come to you collectively or in any other way?

Sir Robert McLean: We deal only with the Air Ministry, who are responsible for the supply to the other arms of the service.

3760. *Sir Thomas Allen:* A reference was made this morning to exports. I noticed that a question was put in the House of Commons with regard to the export of aircraft, and in the reply it was stated, if I remember rightly, that 415 complete aeroplanes were exported and 687 engines; that of those completed aeroplanes, 408 went to Germany, leaving 7

for all other countries; and 583 engines went to Germany, leaving 104 for other countries.*

Professor Gutteridge: Have you the dates, Sir Thomas?

Sir Thomas Allen: I am sorry, I have not at the moment. Presuming those figures are accurate, and in view of the fact that was advanced this morning that those engines in particular were about three years old, were they from stock or were they manufactured to a pattern that was three years old?

Colonel Fell: They were manufactured to a pattern that was three years old. They were manufactured specially.

3761. *Sir Thomas Allen:* You would not regard that pattern as being obsolete in any way?

Mr. Allen: Would you mind telling us where the figures come from?

3762. *Sir Thomas Allen:* They came in a reply to a question put in the House of Commons, I believe by Dr. Addison. It is very vague in my mind at the moment, but I took the figures down at the time and that was the reply, if my memory is not at fault.

Sir Robert McLean: Might I get the figures clear? You mentioned 408 aircraft exported to Germany?

Professor Gutteridge: Perhaps Sir Thomas would repeat the figures.

3763. *Sir Thomas Allen:* 415 complete aeroplanes, of which 408 went to Germany, and 687 engines, of which 583 went to Germany.

Sir Robert McLean: What year was this?

3764. *Sir Thomas Allen:* Last year.

Mr. Handley Page: I do not think there have been any aeroplanes exported to Germany.

Mr. Fairey: I have never heard of one.

Sir Robert McLean: But if there had been, they would have been exported with the full approval of the government, had they been military aircraft. I question the figures. I think the figures are not accurate.

3765. *Sir Thomas Allen:* If they had been exported we may take it that they would have been exported with the consent of the government. But what is troubling us is this, that someone said this morning that occasionally an aeroplane or an engine was sent out and they manufactured from one or more machines. It is not possible to say that all those would have been sent out simply as a basis of manufacture for others.

Mr. Fairey: There is something wrong. I have never heard of a solitary aeroplane being exported to Germany.

3766. *Professor Gutteridge:* Is it a question of date? You are speaking of last year.

Sir Robert McLean: Or any year.

3767. *Professor Gutteridge:* Is it possible they were exported at any earlier period?

Mr. Fairey: There never have been aeroplanes exported to Germany. I do not think there is a solitary instance.

3768. *Professor Gutteridge:* So the date is immaterial from that point of view.

Mr. Fairey: I cannot recall that a single aeroplane has been exported to Germany since the War.

Colonel Fell: There were 80 engines of the Siddeley make and roughly 30 Rolls-Royce engines—I think that is the total—and those were not exported during last year at all. They were all exported in 1934.

3769. *Sir Thomas Allen:* I will ask the secretary to verify or otherwise my figures. We will get it on the record later on.*

Sir Robert McLean: Certainly we will look it up.

3770. *Sir Thomas Allen:* With regard to your Society, does it rest upon any financial structure at all?

* QQ. 3760—3769: In reply to a question in the House of Commons on 11th July, 1935, it was stated that during the year ended May, 1935, 408 complete aeroplanes and 583 aeroplane engines of United Kingdom manufacture were exported, and that of these, 5 complete aeroplanes and 80 aeroplane engines were exported to Germany.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

Sir Robert McLean: No. The Society's reserve funds are merely those required to carry on its day to day activities.

3771. *Sir Thomas Allen:* Do you at any time help to keep each other going?

Sir Robert McLean: No.
3772. *Professor Gutteridge:* What is your issued capital?

Mr. Allen: We are at cross purposes. Do you mean the issued capital of the industry?

3773. *Professor Gutteridge:* No, of your Society.

Mr. Allen: The Society is a company limited by guarantee and has not any capital.

3774. *Professor Gutteridge:* You have not obtained the permission of the Board of Trade to omit the word "Limited," that is all?

Mr. Allen: Yes.

3775. *Sir Thomas Allen:* I notice in the figures of the returns that the export of aeroplane engines and parts during the last 10 years has totalled an average of £1,500,000. Would you agree that?

Sir Robert McLean: Yes, per annum.

3776. *Sir Thomas Allen:* What percentage is that of the total production in Great Britain?

Mr. Fairey: The Air Ministry orders are about £5,000,000.

3777. *Sir Thomas Allen:* And may I take it that the export of aeroplanes that are or are not instruments of war is as high as anything in the way of military exports?

Sir Robert McLean: We have no data on that.

3778. *Sir Thomas Allen:* There is one point I would like to clear up. I have read that while non-inflammable diesel oil is used for trams, ships, omnibuses, and other forms of transport, it is the exception to use it for aeroplanes. Is that so?

Sir Robert McLean: That is not strictly true. Diesel oil is used in certain cases in air transport—so far not in many cases, but the reason is one of technical development.

3779. *Sir Thomas Allen:* Is it largely true?

Sir Robert McLean: It is largely true, yes.

3780. *Sir Thomas Allen:* It has been further advanced that the use of the petrol engine is superior for military purposes but that, as a result of using the petrol engine, when an airman comes down there is no chance at all for him, the machine simply blazes away; that on the other hand, if a diesel engine were adopted, the result might be quite different, and there would be a saving of life. Can you help us by giving us any information in regard to that?

Mr. Fairey: In the first place, the object of using the diesel engine would be for the long-range machine, not for the short-range. The petrol engine is infinitely superior for the short-range machine. For the machine that stays in the air for over four or five hours the diesel engine is superior, but for anything less than that the petrol engine is superior. That is approximately. The fire danger has been proved to be located mostly in the inflammability of the hot oil from the broken engine to the exhaust. Certain experiments have been made in America. It is not certain that the use of diesel oil would remove the fire danger. It would probably reduce it; but it is not certain. The chief source of ignition has been proved to be the hot oil from the engine itself. It reaches the exhaust valves or exhaust manifold and fires more swiftly.

3781. *Sir Thomas Allen:* This morning you told us that the only country producing for itself was Soviet Russia. Later you said that you were exporting engines to Soviet Russia. Did I understand you aright?

Mr. Fairey: We were speaking of aircraft. Not in big quantities; small quantities.

3782. *Sir Thomas Allen:* Complete aircraft engines?

Mr. Fairey: Complete aeroplanes with engines.

3783. *Sir Thomas Allen:* Complete planes?

Mr. Fairey: Complete planes.

3784. *Sir Thomas Allen:* Would it be giving away any secret if you were to tell us something about the quantity?

Mr. Fairey: It is very small.

3785. *Sir Thomas Allen:* I would like to develop the point that was advanced this morning by Sir Philip with regard to collaboration for scientific research. Witnesses have told us that the flexibility of the present system is very detrimental to mass production in time of war and that a system of standardisation would be very much better, that this infinite variety of firms and variety of types which different companies handle is a very serious handicap in the hour of emergency. Could you say anything about that?

Mr. Fairey: It is entirely a question for the Ministry. These types are made to the order of the Ministry. We do not decide what types are to go into production. We wish we did. It is for military reasons that they have this variation. They would have just as many types if the factories were nationalised—or they would need them.

3786. *Sir Thomas Allen:* On the supposition that you had more or less a free hand and were not subjected to the Air Ministry in any way, would you favour less variety in types of machine?

Mr. Fairey: That is a military question, not a commercial one. These different types exist not because of the number of firms but because of the different types of military aircraft that are required; there is the interceptor, and the reconnaissance fighter, and a number of different types. The requirement is a military one. The commercial requirements do not affect the situation.

3787. *Sir Thomas Allen:* Failing state ownership or state monopoly, have you any suggestions to make that would be helpful to us with regard to the control of profits? Because one of the strong arguments that has been put up to us is that this type of manufacture—like others, of course—is a profit-making machine and the public are more or less alarmed at the profits that are made out of these industries. What suggestion can you make with regard to the control of profits that would give the public confidence, which they do not appear to have at the present time?

Sir Robert McLean: If I may refer to the present emergency and what is called the expansion programme, I think I could probably set your mind at rest by saying that in all matters regarding prices, and therefore profits, the industry as a whole has agreed that in any case of disagreement about the adequacy or otherwise of a price we would be prepared to abide by the advice of three impartial gentlemen of high standing, that we would be bound to accept the advice that they offered to the Secretary of State for Air as to the price to be paid.

3788. *Sir Thomas Allen:* There would be a system of government costing *vis-à-vis* your industry. The matter would be gone into closely and prices would be adjusted.

Sir Robert McLean: There would be a technical cost investigation of our tendered price and in case of inability to agree a price with the Air Ministry then these three impartial gentlemen of high standing are called in, the matter is referred to them, and we are bound to abide by their decision. They were appointed by the Secretary of State for Air.

Professor Gutteridge: It is virtually a system of arbitration. The only difference is that you allow the other side to appoint the arbitrators. Otherwise it is an arbitration.

3789. *Sir Thomas Allen:* Would you have any objection to the publication of the decision arrived at between you and the Air Ministry? That would give confidence to the public.

Sir Robert McLean: That, I think, is purely a matter for the Secretary of State. They are his nominees.

3790. *Sir Thomas Allen:* Have you any idea of the size of the aeroplane business on the continent, or outside Great Britain—is it very large?

Sir Robert McLean: It varies in different countries.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

3791. *Sir Thomas Allen*: You have no figures at all?

Sir Robert McLean: No figures at all.

3792. *Sir Thomas Allen*: With regard to world production.

Sir Robert McLean: No. In many cases figures of production would not be available.

Mr. Fairley: Many air forces are bigger than the British, and therefore we must assume that the figures are bigger.

3793. *Sir Thomas Allen*: That would apply to Germany?

Mr. Fairley: To Germany also.

3794. *Sir Thomas Allen*: In the last paragraph of section VIII of your statement,* you make this remark: "... that the backbone of the Ministry"—that is the Ministry of Munitions—"was the private industrialists who readily gave their services to co-ordinate and control production." I take it that whatever the decision might be with regard to national production in totality, or in part together with private production, you would give that loyalty in any future emergency that you have given in the past.

Sir Robert McLean: I think so. That stands as a matter of course. It is a question of patriotic citizenship.

3795. *Dame Rachel Crowdy*: I am very interested in a paragraph in section XII of your statement. You say "Beyond these regulations the Ministry"—that is the Air Ministry—"exercises an overriding veto on foreign sales of military aircraft, including the grant of licences to manufacture abroad." You go on to say "It is assumed that the Board of Trade would not grant an export licence without reference to the Air Ministry, but in practice the matter is referred to the Air Ministry by the aircraft constructor direct in the beginning, and the constructor acts in accordance with the wishes expressed by the Ministry." In one case it deals with the grant of licences to manufacture abroad and in the other it deals with the grant of licences for export. I have two questions to ask. First of all, can you give this Commission any idea of what is the basis—if you know it—of the Air Ministry's veto on the grant of licences for setting up factories abroad?

Sir Robert McLean: The setting up of factories has no relation to this matter.

3796. *Dame Rachel Crowdy*: You mention the veto on foreign sales, including the grant of licences to manufacture abroad.

Sir Robert McLean: That is the licence to another constructor abroad to manufacture a particular type of aircraft.

3797. *Dame Rachel Crowdy*: I should be very interested to hear what is the basis of the grant.

Sir Robert McLean: The basis, I think, is this, that they have no objection to our making this particular design of commercial value to us, provided it is not against the public interest.

3798. *Secretary*: Is the veto based on statutory authority?

Sir Robert McLean: The veto is not based on statutory authority.

Mr. Fairley: I would not be quite certain. The Ministry have issued a memorandum informing us that we have to obtain permission. Of course there is the Official Secrets Act, but above all there is the fact that we are hand and foot with the Air Ministry. We would in no way upset them.

Sir Robert McLean: I think it is a question of public interest. If what is being disclosed is of no detriment to the public interest they would have no objection.

Mr. Fairley: I imagine the Official Secrets Act is elastic. They could find a way out.

3799. *Professor Gutteridge*: It is reinforced by the fact that they have resident officers.

Mr. Fairley: They have resident inspectors. Everything that we do comes under their eye.

3800. *Dame Rachel Crowdy*: With regard to this second sentence—"It is assumed that the Board of Trade would not grant an export licence without reference to the Air Ministry," etc.—would the Board of Trade ever refuse to grant a licence which was recommended by the Air Ministry should be granted to you? Have you had any cases where the Board of Trade has refused on the recommendation of the Air Ministry to grant a licence? Can you remember any?

Mr. Fairley: I cannot remember one.

3801. *Dame Rachel Crowdy*: Are you ever refused a licence?

Mr. Fairley: Very often. We are refused permission to export.

3802. *Dame Rachel Crowdy*: I mean an export licence.

Mr. Fairley: Very often.

3803. *Dame Rachel Crowdy*: For political reasons?

Mr. Fairley: For political reasons and no other. The China war, the Chaco war, the Greek revolution, were cases.

3804. *Dame Rachel Crowdy*: Of refusal to allow the export of military aircraft?

Mr. Fairley: I am afraid we do not question the authorities. We are so accustomed to take it for granted that they have the necessary statutory powers. We asked the Ministry's permission, having got contracts, and they said no.

3805. *Dame Rachel Crowdy*: Can you export convertible planes? It has been stated in evidence that you can make commercial planes into military planes, that a certain type of plane is convertible.

Mr. Fairley: You do not need a licence to export purely civil aircraft. That is to say, aircraft with no equipment and fittings for military purposes. Nevertheless, no attempt is ever made to evade the regulations.

3806. *Dame Rachel Crowdy*: The type of aircraft that has been termed by our witnesses "convertible" is, I suppose, easy to convert.

Mr. Fairley: I do not know what that means.

It depends upon what are the military purposes for which it is required and the type of machine.

3807. *Dame Rachel Crowdy*: I suppose they refer to those types that could be used for bombing purposes.

Mr. Fairley: You can use any plane for bombing purposes provided it will not be encountering any fighting planes.

3808. *Dame Rachel Crowdy*: Those you can export quite freely without licence?

Mr. Fairley: Yes.

3809. *Dame Rachel Crowdy*: Even to any country for which there is an embargo on the export of military aircraft?

Mr. Fairley: Presumably.

3810. *Dame Rachel Crowdy*: Did you in fact export to any great extent these commercial planes that could be converted, to China and Japan from 1931 to 1933, to Bolivia and Paraguay from 1932 to 1935?

Mr. Fairley: None whatever. The bulk of us do not make any civil aircraft, or very few, and the de Havilland standard planes are much too small for bombing. It is only recently that the de Havilland transport planes might be used for bombers. I am sure they never have. No attempt has been made to evade the regulations.

3811. *Dame Rachel Crowdy*: Then you would not have any objection, in view of the fact that certain civil planes are convertible for certain purposes, if the export licence granted by the Board of Trade were extended to civil planes?

Mr. Fairley: I imagine not. A few more regulations more or less would make no difference.

Mr. Handley Page: Commercial machines are not readily convertible into war planes. It is true to say that the development of high-speed planes is tending to merge towards one another, but that is a different thing from making a machine convertible. I do not think any power wanting to buy

* See p. 511 *supra*.

7 February, 1935.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

a quasi-military machine would think of buying a civil machine with a view to converting it.

3812. *Secretary*: Is not a military machine without its military equipment a civil machine for the purpose of the regulations?

Mr. Handley Page: I suppose that any military machine when you take off the military equipment you can say is a civil machine.

3813. *Professor Gutteridge*: We were told that the Germans were making aeroplanes of that kind while they were under the ban of the Treaty of Versailles, that they were making something that purported to be a commercial plane, but which could be used for military purposes.

Mr. Handley Page: I think that is very largely a tale. When you are making a machine which it is worth while for an efficient service to use, then you have to be prepared for great changes to make a civil machine into a military one, but what was said this morning was quite different from the question of whether a machine is convertible or not from civil to military. This morning it was said that the designs of military and civil machines tend to become similar under certain conditions and the paramount condition is this that the aeroplane is designed for speed and that in the case of the military aeroplane speed and not armament is accepted as the defence of the aeroplane.

3814. *Dame Rachel Crowdy*: I am speaking of evidence which was given before us about three months ago. We had evidence which was in complete opposition. One day we would hear that a commercial plane could be easily converted for bombing purposes, the next day we were told by another witness that it was absolutely impossible.

Mr. Fairey: It was a confusion of thought. I am not sure that those people were well informed on the question. The fighting aircraft has no parallel in the civil aircraft. The bomber is only of use if it is in country where it cannot encounter fighting aircraft. The commercial plane would have to be redesigned before it could become an effective military aircraft.

3815. *Dame Rachel Crowdy*: The evidence that I had in mind was in connection with a country, obviously in the Far East, where there were no fighting planes to send up against any converted bombing planes that were sent over.

Mr. Fairey: You could use a transport machine as a bomber if you devised and installed the gear for dropping the bombs.

3816. *Dame Rachel Crowdy*: Have you sent any commercial planes to China—that is the country I have particularly in mind?

Mr. Fairey: No.

3817. *Dame Rachel Crowdy*: Or to Bolivia and Paraguay at the time the embargo was on?

Mr. Fairey: No, I assure you that no attempt has been made to evade these regulations.

3818. *Dame Rachel Crowdy*: Certain accusations have been made—

Mr. Fairey: And we thank you for the opportunity of denying them.

3819. *Dame Rachel Crowdy*: No doubt you have read most of the evidence that has been given to this Commission in regard to the aircraft industry, and you know the various accusations that have been made against the industry during our sittings of the last six months. Among others there has been the accusation that the British technical delegates at Geneva opposed total air disarmament. Would you agree with that?

Mr. Fairey: They were not British technical delegates; they were military people.

3820. *Dame Rachel Crowdy*: If you will read your Geneva evidence a little further if you have it by you, you will find that it was stated that the aircraft industry was very much behind the technical delegates who opposed total air disarmament. That is an accusation that has been made. Like Sir Philip, I am not saying that it is a true accusation,

but would you agree that the British technical delegates at Geneva opposed air disarmament?

Sir Robert McLean: The delegates there were carrying out the instructions of the government, they were servants of the government. We had no influence on them whatever, and anything they did was done at the behest of the government of which they were servants, and to lay it at our door that we helped or hindered, encouraged or discouraged them is a complete violation of the facts.

3821. *Dame Rachel Crowdy*: Like Sir Philip, I make no accusation. I simply convey to you the statement that was made to us, and I am very grateful when you give me the answers to the questions that I put to you. I wanted to ask you one more question in connection with what Mr. Allen said just now. He was talking about those 80 engines that were sent to Germany. Would they be exported under Board of Trade licence or not, in view of the fact that we were told that they could have been used for military purposes?

Colonel Fell: They were definitely exported under Board of Trade licence.*

3822. *Dame Rachel Crowdy*: Therefore, the assumption is that they were military planes, otherwise they would not have required the Board of Trade licence.

Colonel Fell: We should have had to get a licence at any time.

3823. *Professor Gutteridge*: You do not require an export licence for engines.

Secretary: Surely the open general licence would cover engines?

Colonel Fell: They were not exported as military planes at all, they were exported for civil firms.

3824. *Secretary*: But they were exported under licence?

Colonel Fell: Yes.

3825. *Professor Gutteridge*: You can give us the names of the firms if necessary?

Colonel Fell: Certainly.*

3826. *Sir Kenneth Lee*: At the end of section VI of your statement you mention the head of the German Army Air Service. I am not quite sure whether you are referring to the head during the War or the present head?

Mr. Allen: The head during the War period. That is an extract from his own reminiscences.

3827. *Sir Kenneth Lee*: That has nothing to do with the present situation. A good many questions have been put to you with regard to research and secrecy. Would it not be very much easier, if the state produced the aeroplane and did the research work, to maintain secrecy for a longer time?

Mr. Fairey: We are entrusted with a number of official secrets and I have never heard of one leaking out. It does not look as if the present system could be improved upon. During the 20 years that most of us have been in the business we have been entrusted with many official secrets. We know in advance what the government specification will be. In spite of this world-wide co-operation that people talk about, I have never heard a solitary complaint from the Air Ministry or from anyone else that a single secret has leaked out.

3828. *Sir Kenneth Lee*: Are all your people under secrecy agreements?

Mr. Fairey: Not all of them, but the secret information reaches the managing-director or the head of the firm and it is, at his discretion, communicated only to those people whom he has under his control.

3829. *Sir Kenneth Lee*: So that they could not leave your service and go elsewhere and disclose the secret?

Mr. Fairey: Not in the stages during which the information remained secret. You understand this information is only secret while it is new. After a certain period we are permitted to publish it.

*QQ. 3821—3825. The witness subsequently modified his answers to these questions. See Appendix 2, p.533.

7 February, 1936.]

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

We never keep a watch on the people; they are all old-established; indeed, they would have to be old-established to hold the high position that they occupy in our drawing offices.

3830. *Sir Kenneth Lee*: But it has only been kept secret because, I take it, the state has been anxious to help you to keep your business together and get orders. The state would not have the same interest in getting orders if they themselves produced the goods.

Mr. Fairey: No, but I suggest the secrecy would be no better, because a state employee could also leave the state employ with secrets of that nature in his possession.

Sir Robert McLean: I am not quite clear what you mean by "secret." Do you mean that aircraft design ought not to be disclosed, or do you refer to the government disclosure to us long before it reaches the stage of design; or do you refer to patents?

3831. *Sir Kenneth Lee*: The patent may never be disclosed, but any information that you have about improvements that it is not desirable for the world to know. If you are doing a great deal of research work you are bound to come across things of importance and invent improvements.

Sir Robert McLean: Any improvements that we make, naturally, in the first place go into the machine that we are developing for the government. Those automatically become secret and nothing can be disclosed until they are on the Open List. There is an intermediate stage where there is part publication, when no secret of importance may be disclosed by us.

3832. *Sir Kenneth Lee*: It is said that it is easier for disclosure to take place or for anything to leak out when it is in the hands of private enterprise than when it is in the hands of the state.

Sir Robert McLean: My answer is that it is not. One could go further and say there is probably more to conceal under the present regime than if the government were responsible for design and development; nevertheless, it does not leak out. It is not to the interests of the firms that it should leak out.

Mr. Fairey: If we file a patent we have a demand from the Air Ministry to disclose it in the provisional stage. If it contains anything of national use and should be kept secret we are requested to hand it over, and we transfer it.

3833. *Sir Kenneth Lee*: Is it not easier for the organisation that does the long distance research to carry that work up to the point of the actual production of the article?

Sir Robert McLean: I think the two functions are quite different. In one case you have the scientists doing basic research, and in the other case you have the skilled draughtsmen and the skilled technicians bringing in their knowledge of metallurgy and so on. There are two different types of people, one the scientist and the other the technician.

3834. *Sir Kenneth Lee*: Surely in other industries it has been proved of great advantage to have the research and technical departments in the closest collaboration?

Sir Robert McLean: Basic research, I think, no; *ad hoc* research, yes. And, of course, we ourselves have our *ad hoc* research establishments which are in the closest collaboration with our technicians and working under the same head. There is scientific research and *ad hoc* research; one is of general application and the other is of particular application.

3835. *Sir Kenneth Lee*: But is it not true that any really revolutionary development must come through long distance research?

Sir Robert McLean: Not necessarily.

3836. *Sir Kenneth Lee*: Why not?

Sir Robert McLean: It may come by following up a line of *ad hoc* development which suddenly discloses something of value that is worth pursuing further.

Mr. Fairey: It may be entirely accidental, such as the slotted wing flap. I have never heard of a pure scientist designing an aeroplane. I would hate to fly in it if he did. The scientists in our research department are on the staff of the designer.

Mr. Handley Page: I have here, if the Commission would like to see it, one of the bound volumes issued each year containing the technical reports of the Aeronautical Research Committee. This copy deals almost entirely with basic research, some of it of a physical mathematical nature comparable with what you find in text-books. The only difference between the aircraft industry and other industries is that we are still engaged in fundamental basic research and not only in *ad hoc* research. The results of that fundamental research are published in this country and other countries. Each firm in addition does *ad hoc* research which in some other industries is provided for by a communal body. The non-ferrous metals industry, the textile industry, undertake that research. We all do *ad hoc* research, but in addition to that we do fundamental research and that is the kind of bible upon which we work.

3837. *Sir Kenneth Lee*: Is not one of the weaknesses of the research movement that very often the industry does not take advantage of the work that has been done?

Mr. Handley Page: That is where I believe the aircraft industry is so much better off than any other industry. In 1911 Lord Haldane laid it down that there must be long range research through the Aeronautical Research Committee. The aircraft industry meets the Aeronautical Research Committee every six months and discusses the whole programme of design. Visits are paid by members of the Aeronautical Research Committee to the different works and the industry tell them what they are doing. We work very closely hand-in-hand with the Department of Scientific Research which deals with these basic problems. That is in connection with our *ad hoc* research work. Then we deal with the technical departments which apply all the principles gleaned from the text-books to actual specifications of aircraft and the industry is asked to work those out. Then we come to the actual application of engineering principles in production. All the way through there is extreme collaboration between the Air Ministry and the industry. I might say the industry is a model that others might copy.

Mr. Fairey: We are a small community; we all know each other.

3838. *Professor Gutteridge*: It is rather like the Yorkshireman's opinion of himself.

Mr. Handley Page: When things are said on the other side I think it is only fair that the industry should give its own view.

3839. *Mr. Spender*: It has been stated that your industry is covered by the government in regard to whatever you do. The allegation has been freely made that those engines exported to Germany could only be used for military purposes. It would be interesting to hear your view.

Sir Robert McLean: My view is that any engine round a given horse-power can be used in a civil or a military aeroplane if it is of modern type.

3840. *Mr. Spender*: Your view is that they were to be used for civil aviation?

Sir Robert McLean: I understand they were consigned to a company making civil aircraft.

3841. *Mr. Spender*: And you say the government presumably is satisfied?

Sir Robert McLean: Presumably the government, having granted a licence, is satisfied.

3842. *Mr. Spender*: In addition to exporting aeroplanes and engines do you send constructors and technicians with your machines when they go abroad?

Mr. Fairey: Flying instructors do you mean?

3843. *Mr. Spender*: Yes.

7 February, 1936.] THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS, LTD.

[Continued.]

Mr. Fairey: No. We send occasionally foremen erectors or people to assist in assembling them.

3844. *Mr. Spender:* Supposing it is a new type and you do not want it to fall into discredit, you want it to be properly handled?

Mr. Fairey: We send an erector, as we call him—a workman.

3845. *Mr. Spender:* We have heard a great deal about this country being backward in aviation. It is said that we are far behind. But according to the kind of picture that you have presented to us we are very much in the forefront technically and commercially. That is your view, is it not?

Sir Robert McLean: I think that is a fair description, subject to the requirements of this particular government.

3846. *Mr. Spender:* Therefore, such backwardness as is alleged, is not due to the industry or to its technical branches?

Sir Robert McLean: No. I would go further and say that where there appears to be disparity it is very often due to conditions peculiar to us. For example, in the development of civil aviation we have been trying to make air transport an economic proposition. On the other hand, America has been prepared to spend £5,000,000 to £7,000,000 a year in trying to make it spectacular. I think I am correct in saying that we spend £350,000 a year against the £5,000,000 to £7,000,000 spent by America.

3847. *Mr. Spender:* There has been very much criticism, and it is agreeable to have your view on record.

Mr. Fairey: We have not, of course, admitted that we are equal in strength of numbers.

3848. *Sir Thomas Allen:* I would like to ask one supplementary question, Sir Robert. Would you view with much apprehension the separation of military from civil aircraft?

Sir Robert McLean: I do not think I would be interested. For one thing, I do not make civil aircraft. The technique of both being the same, it would be entirely uneconomic to separate them.

Mr. Fairey: If it meant that the production of military aircraft would be nationalised I should view it with considerable apprehension, not from my point of view as a manufacturer, but because I know that this country would fall behind.

3849. *Professor Gutteridge:* I do not think that is what Sir Thomas meant. He was asking whether it was possible to carve the industry up into two sections, as I think was suggested by Mr. McKinnon Wood.

3850. *Sir Thomas Allen:* There was a suggestion made to us by someone that the government should undertake the whole aircraft production, that with regard to the military aircraft they should be the sole salesmen abroad, and that they would leave commercial enterprises free to the private firms.

Mr. Fairey: I understand.

3851. *Professor Gutteridge:* I think the phrase used was that they would then throw off the civil part of the business. I think it was Mr. McKinnon Wood who said they would take over the whole and then throw off the commercial part.

(The witnesses withdrew.)

(Adjourned.)

APPENDIX 1

MEMORANDUM BY THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTION, LTD.

ANNEX A

ORDINARY MEMBERS.

Armstrong Siddeley Motors, Ltd. (engines).
Sir W. G. Armstrong Whitworth Aircraft, Ltd. (aircraft).
Blackburn Aeroplane and Motor Co., Ltd. (aircraft).

29226

Sir Robert McLean: I think if that were done and if there were a sufficient volume of civil business demand, firms would meet it. It is obviously a matter of volume of demand.

3852. *Professor Gutteridge:* You do not see anything inherently impossible in it?

Sir Robert McLean: No.

3853. *Sir Thomas Allen:* Do you place any check upon any new aeroplane firm coming in?

Sir Robert McLean: No, we cannot influence that.

3854. *Professor Gutteridge:* You have no interest in foreign companies?

Mr. Fairey: My company in Belgium has been mentioned. Avions-Fairey, and it was said by a witness, in much the same light-hearted manner as other accusations have been bandied about, that it was done to evade the export licence system. Nothing of the kind. We were successful in competition with the whole world in securing orders for the equipment of the Belgian Air Force, subject to the condition that we set up a factory in Belgium to make that equipment. That Belgium branch operates under the Belgian government.

3855. *Professor Gutteridge:* Had that machine previously been offered to our people?

Mr. Fairey: Yes, and not accepted.

3856. *Professor Gutteridge:* None of you maintain any subsidiaries abroad, do you?

Mr. Fairey: I think that is the only one. I believe there is one more company in Greece. The Blackburn company used to have a depot in Greece. I am not sure whether they still have it.

3857. *Professor Gutteridge:* Anyhow, it is not the practice in the business?

Mr. Fairey: No.

Mr. Handley Page: The Blackburn company only manage the national factory for the Greek government where repairs and manufacture are carried out. They do not own it.

3858. *Dame Rachel Crowley:* I ask this question more from personal curiosity than anything else. Are you in the least interested, either from a scientific or financial point of view, in the development of seadromes? I have heard that matter discussed in various parts of the world, in Japan, China, Russia and the States.

Sir Robert McLean: For myself, I should say it is an American idea, the testing out of which I should like to leave to them.

3859. *Dame Rachel Crowley:* It is being pushed by an Englishman.

Sir Robert McLean: Yes, but the Americans are backing it.

3860. *Dame Rachel Crowley:* It is an American financed enterprise?

Sir Robert McLean: Yes; I should very much hesitate to back it myself.

Mr. Fairey: I would endorse that view. I do not think it is a very practical suggestion.

Professor Gutteridge: Thank you, we are very much obliged to you gentlemen for coming to give us the benefit of your evidence.

Sir Robert McLean: Thank you very much.

APPENDIX 2

ARMSTRONG SIDDELEY MOTORS LIMITED,
 COVENTRY.

8th February, 1936.

The Secretary,
 Royal Commission for the Private Manufacture of
 and Trading in Arms,
 Middlesex Guildhall, Westminster,
 London, S.W.1.

DEAR Sir,

It is regretted that when giving evidence yester-
 day before the Commission, I used the words
 "export licence" in an incorrect sense. What I
 intended to convey was that the sale of Panther
 engines to Germany was made with the full know-
 ledge and consent of the Government. A Board of
 Trade Export Licence was not necessary as aircraft
 engines are open export and therefore there was
 no prohibition.

The engines were produced to the Customs before
 shipment in the ordinary way. The consent of the

"S" Branch at the Air Ministry was obtained
 before the sale was made, and we informed the
 "S. 9" Branch from time to time as the engines
 were despatched from the Works.

For your information, the engines were supplied
 to the order of Allgemeiner Elektrizitäts Gesell-
 schaft.

As an indication to you of the technical standard
 of these German engines, I would like to point out
 that the rating was 597 HP maximum. The present
 day rating of this same size of engine after re-
 design to bring it up to modern requirements is
 732 HP maximum.

Trusting that the above information will clear up
 any misunderstanding which I may have produced
 in the minds of the Members of the Commission.

Yours faithfully,

Armstrong Siddeley Motors Limited.

(Sgd.) L. F. R. Fell.

Chief Engineer, (Aircraft Engines).

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

EIGHTEENTH DAY

Wednesday, 6th May, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., LL.D., R.R.C.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

The Right Honourable DAVID LLOYD GEORGE, O.M., M.P., called and examined.

3861. *Chairman*: Mr. Lloyd George, you have been good enough to come here to give us the benefit of your experience and your views. I understand that you have prepared a short statement. Would it be convenient that you should read that to begin with?

Mr. Lloyd George: I am entirely in your hands, Mr. Chairman.

3862. *Chairman*: And then we can ask any questions that occur to us.

Mr. Lloyd George: Shall I read it?

3863. *Chairman*: Yes, please; unless you would like somebody to read it for you.

Mr. Lloyd George: I think I will read it. I may say at the outset that I am in general agreement with the very powerful statement made by Mr. Noel Baker, and corroborated by Dr. Addison, as to the undesirability of allowing the manufacture of arms by private firms. I am definitely of the opinion that it ought to be a government monopoly. I will just give a short summary of my reasons.

The first will be political—to avoid the creation of powerful vested interests whose prosperity depends upon war and preparation for war.

The enormous increase, amounting to tens of millions in a few weeks, in the value of the properties of the armament firms in this country, upon the intimation of a programme of rearmament on a great scale by the government, is in itself a startling demonstration of this peril. These concerns are no longer the property of a limited number of partners, but thousands, may be scores of thousands of shareholders—perhaps more—spread all over the country, either hold or deal in their shares.

Rearmament doubles the value of the holding of every shareholder. Disarmament would either halve it or reduce it to nothing. It is not a healthy state of things in a community when a large, and on the whole, influential body of men, scattered all over the kingdom, should have a direct pecuniary interest in war or agitations which lead to war.

Secondly, there is a good deal of direct, and even more indirect, propaganda conducted by these enterprises. Sometimes it takes the subtle form of inculcating the horrors of war with suggestions that we must prepare to protect ourselves against them. It more often takes the form of an exaggeration of preparations made by other countries, with more than a hint that these preparations are directed against our security.

The pre-1914 government, of which I was a member had an illustration of the latter method.

We all remember the Dreadnought panic. The naval programme of Germany was exaggerated in the press and on the platform. There was an exaggeration as to the number of ships being built and the size of the guns. The advice given the Cabinet as to the importance of small craft rather than monster ships was deprecated. There was a great agitation in this country for an immense programme for the building of huge battleships and battle cruisers. The Cabinet was divided about the need for building so many of these costly ships because some of them took the view held by so many Admirals at the time that what we stood most in need of was small craft.

A Cabinet committee was appointed to investigate all the facts with regard to German shipbuilding and German guns. The armament firms tendered evidence which was in their possession based on secret information which they had received—all of the most alarmist character. They had already passed it on to the Admiralty. This information demonstrated that the Germans were laying down ships considerably in excess of their published statutory naval plan. There is no doubt that this evidence influenced the Cabinet. It turned out to be completely inaccurate. But it diverted the Admiralty from the building of the small craft essential for our commerce, into constructing the biggest of big ships. There was much more profit in the building of these gigantic ships with their monster guns. A torpedo boat destroyer would only cost about one-twentieth of a battleship.

This kind of propaganda is very insidious. The public have no protection against it. In the case I quote the public did not even know that the information upon which we proceeded was largely supplied by representatives from armament firms who were pecuniarily interested in the panic which was created. I have no doubt at all that the information given to us as Ministers was also communicated to politicians outside and to the press. From all I hear, the armament interests in France are just as active on the same lines to-day, although the methods they adopt are even more pernicious. To what extent German armament interests influence German opinion I have no information, but I have no doubt they are equally mischievous there.

But I have practical reasons from the point of view of the efficiency of national defence why the present system is a bad one. But before I come to deal with that aspect, perhaps Members of the Commission would like to ask me some questions on the first part of my case. Or shall I go on?

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

3864. *Chairman*: I think it would be better to go on.

Mr. Lloyd George: Now I come to what I conceive to be the practical reasons why the present system does not contribute to efficiency.

There must always be a minimum of armaments below which it is not safe for us to sink in an armed world. If you under-insure, you are taking unjustifiable risks in an incalculable international situation, and if I may say so here, a situation which, judging from reports in the press, is aggravated by the fact that peace is disturbed by the capable, and defended by the feeble-minded. On the other hand, if you over-insure, you are incurring unnecessary expenditure which is unproductive in so far as it is not essential to protection and you are also provoking a competition in armaments which leads to fresh expenditure and endangers universal peace.

But past experience demonstrates that you cannot altogether rule out of account sinister contingencies, however improbable they may be at the time. In 1914 few anticipated a world war. I cannot recall one who ever thought it possible we should have to send an army of several millions across the seas to fight in three continents. As a matter of fact we levied and trained millions of men, but they were not fully equipped for battle for nearly two years. The War has taught us the importance of being ready for all contingencies, to the extent of being in a position to put all our manufacturing resources into operation as soon as war is declared. When you contemplate the possibility of another great war, what matters most is the facilities we possess for speedy expansion on the most effective lines. Here nationalisation of armaments has an enormous advantage over private firms. When in 1914 it came to the need for increasing our supply of munitions on an enormous scale, private firms broke down completely. And in war time is often decisive. If war comes, there should be no delay beyond what is inevitable in the provision of all the necessary equipment for carrying it on effectively.

What were the principal causes of the delay in the Great War?

(1) Designs, patterns and specifications of essentials were not ready.

(2) Even when the designs were there, we had not sufficient gauges for accurate manufacture and that is all important. The shortage of gauges accounted for months of delay.

(3) We had no survey of the available machine tools in this country and, if we had, there was nothing like a sufficient number to meet the demand. They took months to manufacture even with the aid of America.

Until we received those machine tools, we could not begin the manufacture of our guns, for instance, and we had to wait for months until they were supplied. I am blaming no one. No one had contemplated a war in which we would be called upon to play so vast a part on land.

Had we possessed such an organisation as Sir Eric Geddes indicated very clearly in his evidence before the Commission, if our designs had been prepared, if we had had an adequate supply of gauges and machine tools ready to hand out to the producers, we should have saved several months—not far from a year.

You may say that it would involve heavy expenditure in peace time. Not at all. For a few hundred thousands—certainly a very few millions—it is wonderful what you could accomplish on these lines.

These essential preliminaries did not cost us much in money—not directly. On the other hand, their absence cost us immense sums and many hundreds of thousands of deplorable casualties.

All this important question of design involves constant research and experiment.

Then the question may be asked: Why cannot private firms prepare designs, patterns and specifica-

tions, and engage in research and elaborate experiments just as well as the state? One reason is that it would land them in expenditure on a great scale with only problematical commercial results. Where there is no prospect of immediate results, where the application of these things may be postponed to a remote or an indefinite period, it is not worth their while incurring all this capital expenditure in preparations. It is only a war or a war panic that would pay them for efforts which alone would in practice prove equal to the need. They are trading concerns for profit. The state, on the other hand, has to take precautions for contingencies that it is doing its best to avert and to prevent from ever arising without reference to trading profit.

Take the cost of experiments. I will take, for instance, tanks. In the final stages of the War they played almost as great a part in ensuring us victory as any other weapon. I do not think that I would be far wrong in saying that they played a greater part in the last few months of the War than any other particular weapon. But they are a comparatively new contrivance and a long way off reaching perfection. Those we used in 1918 were a wonderful invention but they were crude and clumsy in comparison with their successors of to-day. The casualties amongst them in 1918 were exceptionally heavy. I mean not merely the casualties among the men who were manning them, but the casualties among the machines. In 1918 they were exceptionally heavy and, I think, before that. At the famous battle of the 8th August, 1918, 60 per cent. of them were put out of action and anti-tank devices had then hardly had time to develop.

Constant experimentation is essential if we are ultimately to work up a machine that will overcome traps, anti-tank guns and other counter-measures. Now this is the point I wish to make, and I think you will find that it is relevant to the subject matter of your inquiry. To carry out these experiments, large tracts of land of every kind and conformation must be available. It would not be possible for private firms to command sizeable and suitable terrain. The government is equipped with the necessary powers—and where necessary the capital—to provide the ground for experimenting, and every kind of ground which is vital to experimentation of a weapon of that kind which is going to become—which did become, as a matter of fact, especially in the last year, about the most important weapon in the War.

Then if war ensues and expansion becomes necessary, there are serious labour difficulties to overcome when manufacture is in the hands of private firms—and even when manufacture is in the hands of the state—in dilution of skilled labour with unskilled and the training of unskilled men and women. For expansion of production on such a vast scale that you would need in a war such as the last war, the number of skilled workers in this country is quite inadequate. There must therefore be a dilution of skilled with the unskilled and a training of men and women for jobs hitherto undertaken by skilled craftsmen organised into powerful unions. During the War the unions were prepared to suspend their privileges for the country's needs, but they were most reluctant to make the same concession to private firms whose profits were swollen by the transactions. I am not passing any comment one way or the other on their attitude. There is much to be said for it. But I am stating a fact with which we had to deal in the last war, and if ever we have another war, you will be confronted with it again. The adjustment occupied a great deal of valuable time and gave recurrent trouble, and most of it occurred in consequence of the objection on the part of the unions to suspend and perhaps jeopardise privileges that it had taken generations for them to win, in order to enhance the profits of private individuals. They never raised the objection in so far as it applied to state organisations. But they were involved in the general consideration of manufacture by private as well as by national organisations—you could not

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

relax it for one without doing it for all of them. That is a very very important factor which I beg you to have in mind, because I know how long it took to settle that business and how it caused constant trouble during the War and, to a certain extent, impeded the output of munitions of war when time was very vital to this country.

America is an admirable illustration of what the system of private manufacture in the event of war can and cannot do. America, I suppose, is the greatest manufacturing country in the world and we all anticipated that when America came into the War she would show us an example in the speed and the efficiency with which she would turn out munitions. That was not the case. The manufacture of munitions was left largely in the hands of private firms. After 18 months of war, the Americans had no guns, heavy or light, of their own, they were dependent upon the French and upon ourselves, and their aeroplanes only came in two or three months before the armistice. We had to supply them with all those weapons and with things like field kitchens. And yet America is the greatest manufacturing country in the world. They wasted their time on devising new patterns which could have been instituted and perfected without very much cost by state arsenals before the War and could have been put in immediately after war began and turned out in great numbers had the specifications and the jigs and gauges been prepared.

As a matter of fact, both here and elsewhere, private manufacture completely broke down in the War. Orders were given on a great scale but not fulfilled. It is a lamentable story of the failure of private enterprise in the furnishing of munitions of war.

Dr. Addison has given you the figures of the promises and performance of the first few months of the War, and they are very striking. No one who peruses them will fail to realise why we were not only unable for nearly two years to make any attack upon the German trenches without appalling losses, due to lack of artillery and high explosives, but, moreover, our troops had not enough ammunition to defend themselves in their own trenches by retaliating upon the enemy's guns, although promises were quite adequate to supply us with a very fair amount of ammunition. Whilst promises of this kind were given to us heedless of any reckoning as to the possibility of executing them, similar undertakings were given to the Russians with even worse results. Enormous orders for every kind of ammunition were booked by Russia with our armament firms, notably one firm. Not even an appreciable percentage of the obligations undertaken was ever discharged. The Russians depended upon them, waited for them, and found themselves with no means of defending their lives against the terrible German guns which poured shot and shell upon them. The feeling against the British firms, as I know, was exceedingly bitter in the Russian army and I am not at all sure that you will not find something of it in General Knox's book, but certainly in General Knox's despatches, and he was with the Russian army representing us. The failure was attributed to breach of faith by the Russians and there is no doubt it contributed partly to the Russian collapse and the Russian disengagement with the Allies, which was very serious. I have no doubt at all that the contracts which were accepted were entered into in perfect good faith by our firms. There was no breach of faith in the contracts entered into, either with our own government or with the Russian government, but I do not think they realised the difficulties and the limitations of a private firm under such conditions. The armament firms depended upon a system of peddling out. They knew they could not do it themselves, so they peddled out part of the work to other engineering firms all over the country engaged on civilian work which had to be suspended owing to the War. But they had not

the authority which a government necessarily has of securing the co-operation of these other firms. And, moreover, it is no use pretending that a great armament firm is not particularly anxious to encourage other firms to start on profitable business which might, in the end, result in the establishment of formidable rivals. So the peddling out was done with a good deal of businesslike caution. When the government took in hand the organisation of all our engineering resources for the production of munitions, we had no difficulty in securing the fullest co-operation and the largest output under complete government control.

Those are some of the ordinary difficulties. I thought I would just make that statement as a general indication of my line.

3865. *Chairman*: Thank you, Mr. Lloyd George. If I may I would like to ask some questions upon this statement. You began by saying you were wholly in favour of state monopoly in the manufacture of arms.

Mr. Lloyd George: Yes.

3866. *Chairman*: Would you extend that state monopoly to all branches of arms and munitions? Take, for instance, ships: Would you extend the monopoly to battleships? We will take another— aeroplanes. Would you extend it to all classes of manufacture or only to limited classes of manufacture?

Mr. Lloyd George: I would go as far as it is practicable to go in that respect. I think the less you leave to private manufacture the less is the incentive to promoting agitation for war. You might find that it would not be practicable immediately to go the whole way, but I would go as far as it could be accomplished.

3867. *Chairman*: Of course, that is what we are trying to find out, how far it is practicable, and whether it is at all practicable with regard to ships or aeroplanes and engines. However, your answer is that you would go as far as is practicable.

Mr. Lloyd George: Yes.

3868. *Chairman*: The next question I would like to ask about the monopoly is this: To make a monopoly effective must you not really go as far as having complete nationalisation, not only of the manufacture but of the raw material?

Mr. Lloyd George: No, I should not say that. During the War we had to do it.

3869. *Chairman*: Yes.

Mr. Lloyd George: We had practically to assume control of all the raw material and to distribute it according to the necessities of the time.

3870. *Chairman*: But if it is a fact that you had to do that in the War—you arrived at complete nationalisation in the War—in order to make your monopoly complete does not the same argument apply to peace time?

Mr. Lloyd George: I do not think so, not necessarily; because you are not working under the same pressure. You see, time counted there. And besides, there was hardly any private manufacture except for the most urgent needs of the nation. In that case there was no real competitive production.

3871. *Chairman*: I wonder if you would look at the matter from this point of view: Whether or not the most effective policy to adopt from the point of view of national defence is to adopt a policy of private manufacture working in collaboration with government arsenals and government manufacturing places. Take, for instance, the case at the present moment of the manufacture of a battleship in government dockyards. A great portion of that battleship—if I may use the word "portion" having reference to all the complements—is acquired from private manufacturers and put into the ship by the government. You have there a case of the government working in collaboration with private manufacturers.

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

Mr. Lloyd George: You mean, for boilers and things of that kind?

3872. *Chairman:* All the fittings of the ship.

Mr. Lloyd George: Fittings, yes.

3873. *Chairman:* And the guns, I suppose?

Mr. Lloyd George: No, not guns. I can well understand fittings.

3874. *Chairman:* Engines?

Mr. Lloyd George: Engines, yes; not guns.

3875. *Chairman:* Take the engine: That is a very important part of the ship?

Mr. Lloyd George: Yes, I agree.

3876. *Chairman:* That works very efficiently and is unobjectionable from any point of view, is it not, that the private manufacturers should assist the government to the extent and in the same sort of way that they are doing with regard to the building of battleships?

Mr. Lloyd George: Yes, I should say it is inevitable. This is how I would put it, that you must depend largely upon private manufacture for the supply of certain essentials.

3877. *Chairman:* I come to another question, from the same point of view. Supposing, for instance, a system were adopted of private manufacturers working in collaboration with the government arsenals and so forth, none of the evils that result from the private trade in arms would arise, would they? These evils that are spoken of arise, not from the private manufacture, but from the private trade in arms.

Mr. Lloyd George: Surely the incentive to profit is what you have got to eliminate, because if you have got the inducement of profit for people to encourage panics and agitation and wars and preparations for war, as long as that lasts you have an element of danger in a community, which, I think, ought to be eliminated.

3878. *Chairman:* Yes, but take the question of profit. It goes very deep. Because the persons who are interested in the supply of the raw material are just as much interested from their point of view in the demand for their goods which arises from the threat of war or actual declaration of war. You cannot eliminate that objectionable element of profit by merely attaching it to the completely lethal weapons?

Mr. Lloyd George: You cannot eliminate it altogether, I agree, but there are groups whose business depends practically upon war preparations. Take the other firms, they are firms the major part of whose business is in the production of commodities which are useful for peaceable purposes. I draw a very great distinction between them, whether in the output of raw material or in the output of engines. In all those cases it is just a part—sometimes a small part—of their business, and the major part of their business is in turning out articles or machinery for producing material for peaceable ends. You cannot altogether eliminate the element of profit as long as you have the present system of private enterprise in this country. That is why I use the words "as far as practicable, I would do it." The greatest danger at the present moment is that you have firms the existence almost of which depends upon war preparations, and those are the firms, both in France and elsewhere, who are taking a leading part in these agitations. We never had any evidence from people who turned out raw material and engines in 1908. All the evidence that was gathered together was by armament firms whose business depended upon turning out huge guns.

3879. *Chairman:* You say, "There is a good deal of direct and even more indirect propaganda conducted by these enterprises." The enterprises are the private manufacturing firms?

Mr. Lloyd George: Yes.

3880. *Chairman:* You say: "Sometimes it takes the subtle form of inculcating the horrors of war with suggestions that we must prepare to protect ourselves against them." Then you give the one illustration about the Dreadnought case. I will deal with that in a moment. Have you any other instance in your

mind? I am not speaking of what happens abroad, because we cannot deal with that, but in this country have you any other instance in your mind?

Mr. Lloyd George: Not one within my own knowledge, upon which I could really give evidence. I have a great many cases where I have been told about things, but I do not want to repeat that, because I could not prove it. But there is a case that came within my own observation.

3881. *Chairman:* We will deal with the Dreadnought case. That has been referred to here before as the Mulliner incident.

Mr. Lloyd George: Yes. Mulliner was not the only one, but he was the worst, I agree.

3882. *Chairman:* Dealing with Mulliner, we have been told that the information that Mulliner got was information which he obtained in Germany by going through Krupps' works, as I understand, in which he saw that preparations were being made to lay down plant for erecting permanent gun mountings—if that is what they call them—greatly in excess of what were needed for the then published German programme, and that the fact that this plant was being laid down would enable the German government, if they thought fit, to produce battleships at a very much quicker rate than any other country which had not the same facilities; and that he conveyed that information to the Admiralty. Do you suggest that the information that he gave was inaccurate? Because we are told that it was strictly accurate.

Mr. Lloyd George: The impression he gave was that the Germans were going to build at a greater rate than that which they laid down in their naval law.

3883. *Chairman:* Yes, but that was the inference that he drew from seeing these preparations being made for the erection of this plant.

Mr. Lloyd George: Whatever the inference was, that is the statement he made, and that was the impression he left on the Cabinet, that we should be confronted with so many German ships in about—I forget whether it was two or three years—that we should be in a minority. It turned out to be absolutely inaccurate. It was untrue.

3884. *Chairman:* What I want to know is this: Do you challenge the fact that he did see this plant in course of erection and that he drew an inference from it and he conveyed that inference to the Admiralty?

Mr. Lloyd George: I cannot tell whether he saw it or whether he did not see it. All I know is that the evidence he gave us was untrue.

3885. *Chairman:* What was it he said that was untrue?

Mr. Lloyd George: What was untrue was, that the Germans could produce in whatever the number of years was—I think it was two; and meant to produce, so many ships of that size that we should be in a minority by, say, 1912, or 1913, whatever was the date.

3886. *Chairman:* Yes, but we are informed that he gave the actual fact of what he had seen and he told you the inference he drew from it—it was for you, or the people to whom he gave the information, to say whether the inference was justified or not—but that he did not give any false information. He may have drawn a wrong inference and you may have followed his wrong inference.

Mr. Lloyd George: No, no. It was not a question of inference at all. We were not depending upon inferences. We were depending upon definite evidence. After all, it was a responsible Cabinet committee, and he stated as a fact that the Germans were preparing and were in a position to add to their fleet so many ships that we should be in a minority by a given date. It was absolutely untrue. What were his grounds for it is another matter. He may have given his reasons for it. I have no doubt he did. But he stated that as a fact.

3887. *Chairman:* We are also told that there was a Cabinet inquiry made as to whether what he stated

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

was accurate or not, and the facts that he had stated—I am saying nothing about the inferences—were corroborated and found to be true.

Mr. Lloyd George: That is not my recollection—certainly not; and as a matter of fact it turned out to be inaccurate, and that is what I want to point out.

3888. *Chairman:* What turned out to be inaccurate was that the Germans did not ultimately do what people thought they were going to do. People thought wrongly.

Mr. Lloyd George: No, no. As a matter of fact they could not have done it. Nobody could have turned out a battleship in less time than we took at that time, and therefore what he said was not a fact.

3889. *Chairman:* That is what Mulliner was challenging. He was saying that the Germans had provided themselves with plant which would enable them to do it more quickly than we did it.

Mr. Lloyd George: Well, it did not; that is the fact; and therefore it was untrue.

3890. *Chairman:* I will ask another question about Mulliner. This is a sort of ethical question. Supposing a person who is engaged in an armament firm finds out a fact which is of great importance from the point of view of national defence, ought he to keep it to himself because he is a member of an armament firm, or ought he to tell his government a fact which it is of real and vital importance that they should know?

Mr. Lloyd George: I think it is his duty undoubtedly to inform the government of the day. But that is not my inference. My inference is that Mr. Mulliner was working up an agitation purely in order to get big orders for the armament firms. I made that suggestion definitely. And it turned out to be so.

3891. *Chairman:* With regard to the practical point of view, I would like to ask some questions, if I may. The experience of the Great War has wholly altered the view, has it not, from the point of view of national defence, of what is necessary to be done by way of preparation?

Mr. Lloyd George: Oh, undoubtedly.

3892. *Chairman:* In two main features. First, the quantities of arms and munitions of war that are required—

Mr. Lloyd George: Yes; certainly.

3893. *Chairman:* And, secondly, the necessity for rapid expansion?

Mr. Lloyd George: I agree.

3894. *Chairman:* Those are the two main alterations, from the point of view of the experience that we have gained from the last war, are they not?

Mr. Lloyd George: There is a third, of course—and you must not leave that out of account—the susceptibilities of labour. That is a very important element.

3895. *Chairman:* I agree. I include that in rapid expansion.

Mr. Lloyd George: As long as it is definitely mentioned.

3896. *Chairman:* Oh, yes; certainly. With regard to the private firms breaking down: They broke down because they were not prepared for the emergency. Is not that so?

Mr. Lloyd George: No. I do not agree. I do not believe they would ever have recovered if the government had not taken them in hand.

3897. *Chairman:* I agree; but take the initial failure.

Mr. Lloyd George: No private firms could possibly have coped with that emergency. They could not have done it.

3898. *Chairman:* That is what I say. They were not prepared.

Mr. Lloyd George: No. If they had been prepared, they could not have done it. They could not have had the necessary control. Supposing you had given them 12 months' notice, they could not have done it.

3899. *Chairman:* Supposing there had been no private manufacture at that time, that there had been a government monopoly, that would have failed for the same reason as private manufacture. They were not ready.

Mr. Lloyd George: I do not agree, if I may say so, Sir John.

3900. *Chairman:* We are simply asking for information.

Mr. Lloyd George: As a matter of fact, the Admiralty and the War Office were depending upon private firms. They had always depended upon them and when they gave an order to a private firm they said "That is all right." If it had been left entirely in the hands of the government, they would not have done that. It would have been their responsibility, not merely to give an order, but to see that it was executed and to take steps for its execution. I do not think you would have had all those months in which we got only about one-third, or less, of our orders delivered if the government had had the direct responsibility at the outset of the War. Because you would have had reports constantly coming into the Cabinet: "Here are two million shells that ought to be delivered and they have delivered only 500,000." I am certain they would have taken the matter in hand. No; I do not think it would have happened. The fact is that there was a dependence upon private firms by the officials of the War Office and the Admiralty, a dependence which up to that date was more or less justified. I am assuming that. No; I think it was due to the fact that you had to depend so much upon private enterprise for the provision of all these munitions.

3901. *Chairman:* There must have been an equal failure unless the state had an organisation that was in existence and from every point of view superior to the private firms; they must have had the same difficulty.

Mr. Lloyd George: No. I have been through this, if you will allow me to say so, and therefore I can tell you something about it. That is not in the least the case. If it had been in the hands of the state, they would not have waited about nine months before they began the manufacture of gauges and jigs and patterns and specifications. They would have appointed a minister who would have been directly responsible. They would have been equally unprepared at the beginning, I agree, but they would have begun their preparations before the month of May, 1915.

3902. *Chairman:* As long as we are agreed that they would have been in an equally difficult position at the beginning.

Mr. Lloyd George: At the outset; oh, undoubtedly. I have already said in my document that nobody anticipated we should send an army of millions across the seas. Therefore, there was no reason why we should have had those preparations. But we would not have postponed the preparations months and months had we not depended upon private firms who, we assumed, knew all about it.

3903. *Chairman:* Upon the question of whether it would be a good system for the private firms to work in collaboration with the government: We are told, in the case of Vickers, for instance, that before the War, Vickers had been receiving a very large number of orders from the Admiralty and that, as a consequence, they were quite fully equipped and prepared to deal with Admiralty requirements, and that, when the pressure came, they were prepared and did, in fact, deal with the Admiralty requirements without any complaint; but that, with regard to the army requirements, they had had very few orders before the War, they were completely unprepared to deal with the class of work that the army required and that, therefore, there was a failure. Is the proper inference from that that you would, and did, get great assistance from the private manufacturer in case of emergency,

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

if that manufacturer was prepared for the emergency?

Mr. Lloyd George: I do not think the private manufacturer could prepare for the emergency unless the state undertook those preparations. Sir Eric Geddes has pointed that out in his evidence, that the whole expense of the preparations must be incurred by the state and not by the private manufacturer, because he cannot go on spending enormous sums of money making preparations for a business that might never come, or might only come in 10, 15 or 20 years, and, therefore, it is the state that has to make preparations and not the private manufacturer.

3904. *Chairman:* Yes, but those preparations, of course, would be preparations under the headings which you have specified—designs, patterns and specifications, gauges and so forth.

Mr. Lloyd George: And machine tools.

3905. *Chairman:* Yes, and machine tools.

Mr. Lloyd George: That is a very, very important matter. Vickers had not the necessary machine tools to manufacture guns.

3906. *Chairman:* And, of course, the necessary ground for testing guns?

Mr. Lloyd George: And the necessary ground; perhaps for tanks more than guns. Some of them have ground.

3907. *Chairman:* Supposing the government decided to make all these preparations and adopt some sort of system such as Sir Eric Geddes suggested and such as has been suggested by Dr. Addison and others in regard to the production of munitions, would it not be of great assistance if they had a number of efficient private manufacturers to do the work and with the necessary trained personnel?

Mr. Lloyd George: I do not see why the state cannot train personnel just the same as private manufacturers, at Woolwich. We had to depend a great deal upon Woolwich for our technical knowledge and skill, and that was not private manufacture at all.

3908. *Chairman:* No; but the more Woolwiches you had, the more material you would have to draw upon in order to get the rapid expansion that you want.

Mr. Lloyd George: I know, but I am assuming that the whole manufacture of arms is in the hands of the state. You would, therefore, require exactly the same number of men and the same amount of skill in the state arsenals as you have at the present moment in Vickers-Armstrongs, but, in addition to that, you would have a reserve of jigs and gauges and patterns and machine tools and greater opportunities for experiment than private firms would have. You would have exactly the same number of skilled men, and more, because a great number of them would be engaged in making patterns which were not going to be put into operation immediately.

3909. *Chairman:* Supposing you confine your personnel to state personnel and you get a long period of peace, at what are those men to be employed? Of course, if you have private manufacturing firms, they can turn their men on to civil work, but you cannot turn your state men on to civil work. That would not be allowed, would it?

Mr. Lloyd George: After all, a skilled engineer who is engaged upon the production of machinery and all the various articles upon which engineers are engaged, is a first-class man to be drawn upon in emergency. You want a certain number of pivotal men who have made a special study of one particular art. But the rest of the men can be adapted in a very short time, as long as they have engineering skill. It does not take long. Our difficulty was that we had not skilled engineers. A skilled engineer can adapt himself in a very short time to any form of production, so long as you have the pivotal men, and you would have the pivotal men if you had state arsenals.

3910. *Chairman:* You say that you cannot expect private firms to expend money on experiments or to

provide designs, patterns and so forth. What about the Air Force? I will not say the whole, because we know there has been a government department dealing with research and so forth, but the great bulk of expenditure on research and experiment and so forth, as regards the Air Force and its development, has been made by private manufacture, has it not?

Mr. Lloyd George: I am told that the amount of research and experiment that you make upon civilian machines is not essentially helpful when you come to consider a machine for military purposes, that it is quite a different business and that a civilian machine cannot be very readily adapted for military use. If that is the case, then the amount of research and experiment that you get from the others is only with regard to the improvement in your machines. If there is improvement in a machine, the state has a perfect right to utilise that for military purposes, whether it is discovered in a civilian factory or in a military factory.

3911. *Chairman:* Yes, but private firms have been spending money on research with regard to military machines up to the present, have they not?

Mr. Lloyd George: I am not quite sure about that, but at any rate, they would go on still. As a matter of fact, more money could be spent upon research and experiment for a military machine if the production were purely for military purposes.

3912. *Dame Rachel Crowley:* If I understand the points that you are trying to make us see to-day Mr. Lloyd George, they are these: You are against private manufacture mainly for two reasons; one, that you think it unethical and unwise that the prosperity of a very large number of people, hundreds of thousands, should depend on war material dividends. That is your first point, I think.

Mr. Lloyd George: That is so.

3913. *Dame Rachel Crowley:* And your second point, if I understood it rightly, was that you think private manufacture really gives a false guarantee of security both to the government and to the people?

Mr. Lloyd George: Yes.

3914. *Dame Rachel Crowley:* Those are your two main points?

Mr. Lloyd George: Yes. I think that is very well put, if I may say so.

3915. *Dame Rachel Crowley:* I would like to turn from that to what you said about the private manufacturers breaking down in war time and their orders not being fulfilled. If I understood the Chairman, he suggested that the orders were not fulfilled because there was such an enormous demand that no one, either government or private manufacturer, could have foreseen what was needed. But that does not seem to me to explain altogether why the private manufacturers took on such large contracts as they did.

Mr. Lloyd George: I agree.

3916. *Dame Rachel Crowley:* I should like to hear your opinion on that, if I may. I would also like to know whether the contracts they took on with Russia, to which you referred, were taken on after they had already realised, or you had already realised, that they were unable to fulfil their contracts with us. If you would not mind speaking to those remarks of mine, to begin with, then I have several questions arising from them.

Mr. Lloyd George: I quite agree that they ought to have known what was their capacity before they undertook enormous contracts of that kind. For instance, when they took on contracts for four million odd shells—I am taking Dr. Addison's figures—and delivered only a little over one million, surely that was a miscalculation. That was thoroughly bad business. They ought to have known. They ought to have told the War Office. They ought to have said to the War Office: "We cannot do it." Then the War Office would have been confronted with the obligation of finding some other means of doing it, and I have no doubt at all they would then have taken counsel with the rest of us

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

for it to be done. Supposing they had come along and said: "We want four million shells by such and such a date; private manufacturers have said they cannot possibly deliver more than a million." We would have realised at once how serious was the position and we would have taken counsel with everybody who could possibly have advised us as to what we ought to do, and we would have done what we did subsequently, in May, 1915. We were never told. I think the contracts with Russia, for the most part, were taken at the same time as the orders that were given by us, but some were very much later, and during the Russian retreat in 1915, and afterwards in 1916, the Russians were always alluding to the fact that Vickers had failed them. See what happened when we came to public manufacture. Here I am speaking from experience. I had a list of the promises given me, whether by national arsenals or by private firms. They were set out for us and I had them printed. At the end of each week I examined the actual deliveries. One saw, for instance, that one firm promised to deliver 20 guns and they delivered only 5, and so on. It was the same when you came to shell. Instantly you called attention to it, you found out the reason. Sometimes they would say to you: "We have not the necessary machine tools." "Very well, we will send over orders to America or to the machine tool manufacturers." We said: "Cannot you do something to improve the situation?" Week after week we knew the position. We never waited five or six months to find out and to report to the War Office; we knew it each week because the output was a government responsibility. It was not the responsibility of private firms. That is the way we were able to correct it, and gradually promises and performances more or less conformed to each other. But it was due to the fact that each week we compared them and, when there were any deficiencies, we tried to find out what was the matter. We could not get iron and steel, or we could not get some other material. Instantly we communicated with the people who produced that deficiency. It is only a government department that could do that, because we were in a position to be able to communicate with everybody. A private firm could not do it. They have not the same authority as a government department. That is why we were able to do it so much more rapidly after the government had undertaken the responsibility of manufacture than before. What was the other question that you put to me, Dame Rachel?

3917. *Dame Rachel Crowdy*: You have really answered my question. I would like to go on to a rather different subject. After all, arms were not the only things required in the War?

Mr. Lloyd George: No.

3918. *Dame Rachel Crowdy*: I should like very much to know how the other private manufacturing industries compared with the arms industry. For example you had khaki turned out in enormous quantities, you had rations prepared in enormous quantities, boots, saddles. Did the firms that undertook to supply the army with those fulfil their contracts or did they fail to the same extent?

Mr. Lloyd George: I am not in a position to answer.

3919. *Dame Rachel Crowdy*: It would be an interesting comparison if we could find out.

Mr. Lloyd George: I quite agree.

3920. *Dame Rachel Crowdy*: I wondered whether it was only in regard to arms.

Mr. Lloyd George: I am not in a position to answer that question.

3921. *Dame Rachel Crowdy*: I suppose the reason for which the Ministry of Munitions was set up was, really, that the private manufacturers had failed.

Mr. Lloyd George: Oh, yes, very largely, undoubtedly.

3922. *Dame Rachel Crowdy*: When you set up the Ministry of Munitions—we know that no one can tell us more about it than you—were you helped or were you hindered by the private manufacturers?

Mr. Lloyd George: I was not conscious of any hindrance on their part. I must say that. When they were sent for I think they did their best, afterwards, because they felt that really we could help them in ways where they themselves had experienced the deficiencies before. No, I cannot say that they hindered us. On the contrary, I think they did their best.

3923. *Dame Rachel Crowdy*: Did you come across at all, what Dr. Addison mentioned to us in his early evidence, cases where supplies were not sent sufficiently quickly until the prices asked for by the private manufacturers were agreed to by the government? Did you have any cases of orders held up until you would agree to certain prices, at the beginning of the War?

Mr. Lloyd George: I had nothing to do, during the first nine months, with the actual ordering of these goods—certainly not with the execution—so I cannot tell what happened then. All I know is that there were deplorable deficits in the execution of contracts. Whether anything of that kind arose I do not know. It did not come within my purview.

3924. *Dame Rachel Crowdy*: You do not regard that as one cause of the delay in the fulfilment of contracts?

Mr. Lloyd George: I have no evidence of it, and therefore I think I had better not speak about that.

3925. *Dame Rachel Crowdy*: We have heard from a good many witnesses who have been in favour of private manufacture that one reason for which private manufacture must continue is that research and invention are so much more encouraged and so much better rewarded in private firms than they are within any government section of armaments. I wondered whether you could tell us anything about that. I have been lately considering the various armament inventions which I myself came across during the War and I have been wondering how many of them were due to the big private arms manufacturers and how many were really invented by service people or by private individuals. It is an argument that has been addressed to us again and again. Four things occur to me: First, the Stokes bomb. Was that the product of an armament firm?

Mr. Lloyd George: That was not the product of an armament firm. My recollection is that Mr. Stokes was a manufacturer of agricultural machinery. That is so, is it not?

Professor Gutteridge: Yes.

Mr. Lloyd George: And they all looked down their noses at him when he came out with it.

Professor Gutteridge: Quite right!

Mr. Lloyd George: Let me give the details about that; because that is not a bad illustration. Had it not been that the government undertook the expense of experimenting, no private firm would have done it.

3926. *Dame Rachel Crowdy*: That is my point.

Mr. Lloyd George: I happen to have knowledge of that. £25,000 was sent by a Maharajah towards the cost of the War. I think it was sent to the Ministry of Munitions, and I spent it upon experimentation, because I could not get any official sanction for it. I have no doubt that if I had asked for money for experiments I could have had it but it was only the government who could have made the experiments. The Stokes bomb experiment turned out to be one of the most useful made during the War. We sadly needed something of the kind, because the Germans had very powerful equipment of trench mortars and we had none. It was extraordinarily simple—which in itself would have condemned it for a great many manufacturers.

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

3927. *Dame Rachel Crowdy*: What about the Mills hand grenade?

Mr. Lloyd George: We could not get the Mills hand grenade manufactured at all until the Ministry of Munitions came in. I think, as a matter of fact, there were only about 15,000 manufactured before the government undertook the manufacture. Then by November we were turning out about a million a week.

3928. *Dame Rachel Crowdy*: Was that the invention of a private individual or did that emanate from some big private manufacturer, in the research laboratory?

Mr. Lloyd George: I do not think there was research by a private manufacturer; at any rate it was not turned out by private manufacturers and the government could not get it done. When we undertook the manufacture of Mills bombs we had not filling stations, among other things, but when we erected filling stations we were able to turn out Mills grenades, and, as everybody knows, they became more essential than rifles. The private soldiers as the War progressed fought more with their Mills grenades than they did with their rifles.

3929. *Dame Rachel Crowdy*: Then, as far as I remember, the substitute for the propellant did not come from a private manufacturer either. Was not that invented by Judge Fletcher-Moulton?

Mr. Lloyd George: Yes. Judge Fletcher-Moulton was the man who, when we were short of certain ingredients—so short that we could not have filled our shells—discovered that there were certain other ingredients which would produce exactly the same results. But that was done by him.

3930. *Dame Rachel Crowdy*: Again not by private manufacturers?

Mr. Lloyd George: Oh, no. He was assisted by the government.

3931. *Dame Rachel Crowdy*: And the paravane?

Professor Gutteridge: That was invented by Burney, a naval officer.

Mr. Lloyd George: That is right.

Professor Gutteridge: And not by a private manufacturer.

Mr. Lloyd George: No. The same applies to the hydrophone.

3932. *Dame Rachel Crowdy*: Then you would say you do not agree with those witnesses whom we have had before us who say that our inventions of the future must depend on the continuation of private manufacture? From your experience you know that some of the most useful things invented and used during the War did not emanate from private manufacturers.

Mr. Lloyd George: Take the tank, which was one of the most important elements in our victory. That came through a committee consisting of Sir Eustace d'Eyncourt, Colonel Swinton and Sir Maurice Hankey. I forget who were the other members of the committee, but not one of them was a manufacturer, and the whole of the experiments were conducted under the aegis of a government department. I took over the manufacturing, I think, some time in 1915. Experiments had been conducted before that by a committee of officers, and I do not know of any manufacturer who was a member of that committee. There was Sir Albert Stern, who came in afterwards, not in the experimentation but in the production. He was not a manufacturer.

3933. *Dame Rachel Crowdy*: Did the people who came from outside into the Ministry, when it was first set up, come largely from private manufacturing firms, or were they largely private manufacturers?

Mr. Lloyd George: Take some of the men who made the greatest impression: Sir Eric Geddes was a railway man; he was not a manufacturer.

3934. *Dame Rachel Crowdy*: I was really referring to the arms manufacturers.

Mr. Lloyd George: No, they would not be in the Ministry of Munitions.

3935. *Dame Rachel Crowdy*: I wondered whether individuals left their firms and came to the Ministry?

Mr. Lloyd George: Yes, there was one—Sir Glyn West. Sir Percy Girouard I think was also in Armstrongs.

3936. *Dame Rachel Crowdy*: But neither of those remained very long, did they?

Mr. Lloyd George: No. I do not want to say a word about them, but they did not. The men who remained were men like Sir Eric Geddes, Sir Ernest Moir—who was a contractor, not a manufacturer—and Lord Stevenson, who was in the whisky business.

3937. *Dame Rachel Crowdy*: It would not be fair to say that the Ministry of Munitions could not have carried on efficiently in its early days had not the private manufacturers sent some of their best people to help you in the Ministry? That would be inaccurate.

Mr. Lloyd George: Oh, quite inaccurate.

3938. *Dame Rachel Crowdy*: Could you give us any comparison of the output of, say, one of your national factories, taking a particular year during the War—one of your government factories—compared with, say, Vickers' factory at Erith? I pick that out particularly because it is one that I know something about. It would be very interesting if we could have particulars of the output of those two factories.

Mr. Lloyd George: I will see if I can get that. I have not got it with me.

3939. *Sir Kenneth Lee*: In the event of the outbreak of war, I presume you would agree that practically all manufacturers would be involved; every producer in the country would be required to produce arms of some sort or another, or equipment?

Mr. Lloyd George: It is not merely the production of arms. Practically every manufacturer is affected by government control.

3940. *Sir Kenneth Lee*: As far as the extra demand for arms is concerned, would not it have been much better if they had had some experience in peace-time of the manufacture of the particular things that they were likely to have to produce in time of war?

Mr. Lloyd George: It is quite impossible. After all, supposing you hand over the manufacture of arms to the government at present, you would have exactly the same number of men engaged in the production of arms as you have now, but the vast majority of the engineers in this country would be engaged on other tasks.

3941. *Sir Kenneth Lee*: But if they had no experience of producing the particular products they were required to produce in time of war, would not there be a loss of speed?

Mr. Lloyd George: I do not think so. We did not find that there was; we found that people who were producing motor-cars and gramophones, and every kind of thing, adapted themselves very rapidly to the production of shells.

3942. *Sir Kenneth Lee*: That is, of course, the policy suggested by the White Paper?

Mr. Lloyd George: It is not the policy suggested by the White Paper; it is the policy which I put into operation in 1915, if you will allow me to say so.

3943. *Sir Kenneth Lee*: It is the policy now suggested?

Mr. Lloyd George: I take it from you that it is.

3944. *Sir Kenneth Lee*: You get a number of firms prepared by giving them sample orders—firms which are not producing munitions in the ordinary way.

Mr. Lloyd George: I do not know whether sample orders would be very much use; because, after all, the moment you turn a factory to the production of something which it was not producing before, you have to reorganise the factory to a certain extent, and that is the thing which takes most time. Any competent engineer can soon pick up the manufacture of these things provided he has an expert there with him to tell him exactly what it is, and provided he

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

has also the right jigs, gauges, and machine tools—that is vital. Once you give him those, a good engineer can turn out any of these things in a very little time.

3945. *Sir Kenneth Lee*: In the event of another war, would you contemplate the conscription of manufacturers and the conscription of employees?

Mr. Lloyd George: I do not know what you mean by "conscription." What is your interpretation of it?

3946. *Sir Kenneth Lee*: Some men would be put into the army, I take it, and some men would be required to stay at home. Would they be equally under control?

Mr. Lloyd George: Under discipline, you mean?

3947. *Sir Kenneth Lee*: Yes.

Mr. Lloyd George: Do you mean that you would put everyone in khaki? We found it quite unnecessary, and I think it creates a good deal of friction, and even the Germans found that they could not do it.

3948. *Sir Kenneth Lee*: Was the fact that they were not in khaki one of the causes of trouble at home with regard to men who were turning out munitions?

Mr. Lloyd George: If you had put them into khaki there would have been far more trouble. You could not have done it. That is one of the things that several war ministries had to consider; we considered it over and over again; not merely here—they considered it in France, they considered it in Germany, and even the Germans shrank from it.

3949. *Sir Philip Gibbs*: Was not it done in France; was not labour conscripted in France? Did not the working men serve on the same terms as the fighting men?

Mr. Lloyd George: Not on the same terms of discipline.

3950. *Sir Philip Gibbs*: The same terms of payment?

Mr. Lloyd George: That I could not tell you; I am not sure about payment; but certainly not discipline.

3951. *Professor Gutteridge*: Would you be in favour of the same terms of payment? That, to my knowledge, caused a good deal of feeling in the army.

Mr. Lloyd George: That is a question that I hesitate to answer straight away; because, after all, in the army a man is fed and clothed, and then there are allowances made for his wife and for his children, and they were fairly generous allowances in this country. I am not sure that you could have done it in munitions unless you actually fed the men, for instance, and then gave an allowance for the family. That you could not do; I should say myself it would be impracticable. That is the feeling I have.

3952. *Mr. Spender*: As you raised the question of 1909, and as you are one of the few people who were in office during that time, perhaps you will let me ask you one or two questions about it. You would not say, would you, that the margin of capital ships provided proved excessive in 1914?

Mr. Lloyd George: You are entering into an argument which is still very much alive.

3953. *Mr. Spender*: It is rather important.

Mr. Lloyd George: Yes. I would.

3954. *Mr. Spender*: You would say it was?

Mr. Lloyd George: Yes, I definitely would. I think it would have been better for us if we had spent more money upon small craft for the protection of our ships, instead of having millions of tons sunk because we had not got the necessary convoys, and providing huge battleships which only fought two battles, the last of them being a battle in which both sides claimed the victory and both ran away.

3955. *Mr. Spender*: There are not many strategists who would agree with you?

Mr. Lloyd George: Yes, there are. I have talked to a good many able men who take that view very strongly, and there were at that time some of the ablest naval men who did not agree in the least with Sir John Fisher about the big Dreadnoughts.

3956. *Mr. Spender*: Our margin, such as it was, was not only made up of the 1909 programme, which you thought excessive; there was another large programme of 1914, which was thought equally imperative, and that was after the Admiralty and the government had had the opportunity of investigating everything that was said. You had another large programme in January, 1914?

Mr. Lloyd George: That was contentious, and I do not want to revive these old controversies.

3957. *Mr. Spender*: But that is the case, is it not? It was not merely Mulliner; the Admiralty did assert that they had intelligence of their own, quite apart from Mulliner, which led them to believe that the Germans were putting themselves in a position to accelerate?

Mr. Lloyd George: Yes; but they were not. 3958. *Mr. Spender*: There is a great deal of German evidence on that subject.

Mr. Lloyd George: I do not know that the Germans asserted that they could, and I think the result demonstrated that they were telling the truth when they said that they were only carrying out a definite programme.

3959. *Mr. Spender*: There is a report in the German documents, in the 28th volume, of a certain conference in Berlin, when Admiral Von Tirpitz made the disclosure which was very embarrassing to Count Metternich, the German Ambassador in London, who assured us the opposite, that they were preparing a new large programme for 1912. That seemed more than to justify everything that the Admiralty had said about the intentions of the Germans.

Mr. Lloyd George: All I know is that, as a matter of fact, the predictions which were made to us as to the number of German ships were wrong. We were given the impression that the Germans would probably have a majority of ships; that the margin would be on the wrong side. That turned out to be absolutely inaccurate.

3960. *Mr. Spender*: If my recollection is correct, was not the government told that unless they took certain steps to add to the fleet in 1909, as they did, and afterwards in 1914, the Germans would be in a position to be in a majority in a certain year—I think the year was 1916, but I do not absolutely recollect it; it was a long way ahead—and it was said contingently: Unless you, the British government, do add considerably to your construction programme, the Germans will in a certain year (I think it was 1916) be in that position; but it was always contingent—"unless."

Mr. Lloyd George: Yes; but the actual figures which were given to us of what the Germans had at a certain date were incorrect. There was no question of the desirability of building a certain number of ships, but there was pressure brought to bear upon the government to build more ships than I think even now were necessary at the time, and that pressure was supported by evidence that the Germans at such-and-such a date would have a certain number of ships which they did not have.

3961. *Mr. Spender*: That might have been contingent; but the main fact was, was it not, that unless you did this or that you would be in a position of danger?

Mr. Lloyd George: If we did not build any ships, then, of course, we would be. There was no dispute at all as to the desirability of building a certain number of ships, but then there was very great pressure to build more ships than were necessary.

3962. *Mr. Spender*: Would that be true of 1914 as well as of 1909?

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

Mr. Lloyd George: I am sorry I have not gone into the question of 1914. I am not at this moment in a position to give an answer about 1914 without looking into it.

3963. *Mr. Spender:* I would only suggest that there was, at all events, whatever difference of opinion there might be on this subject, sufficient doubt to make it very undesirable that the British government should take the risk of being short of capital ships.

Mr. Lloyd George: They took a far greater risk, as the War turned out, of building these capital ships which were no use to us, and neglecting—

3964. *Mr. Spender:* Of no use?

Mr. Lloyd George: They were absolutely of no use. In the War there were only two fights. They neglected, because of that expenditure upon capital ships, the small craft, which we found when the War came was a very serious deficiency, and which resulted in a loss of millions of tons of shipping, and came nearer to losing us the War than anything else.

3965. *Sir Thomas Allen:* When you say "they neglected," could you define that a little?

Mr. Lloyd George: The Admiralty. We constructed all the small craft that the Admiralty advised us to construct, as far as the government were concerned, but the Admiralty were concentrating so much upon these monster ships that they were not giving a thought to what turned out to be far more important in practice, and that was the building of torpedo craft for the protection of our commerce.

3966. *Sir Thomas Allen:* Could we use the word "they" apart from government obligations?

Mr. Lloyd George: I have given my definition.

3967. *Mr. Spender:* That is a very disputed question of strategy, of course, which I do not want to press too much. It may have been that the government ought to have done both, but it is clear even now that no government runs the risk, in the uncertainty of the future, of not building capital ships.

Mr. Lloyd George: I never suggested that capital ships should not be built. My suggestion is that there was an attempt to rush us into building more capital ships than were necessary, and that that had the effect of restricting the output of craft that turned out to be far more essential.

3968. *Mr. Spender:* I think we are in some little doubt as to where exactly we stand in this matter. I do not think there is any substantial difference between us that there would be a very large control necessary—state control—in time of war; but what we are asked to do is to advise a proper peace establishment. I think I understood you to say that you agreed both with Sir Eric Geddes and with Dr. Addison?

Mr. Lloyd George: What was that about Sir Eric Geddes?

3969. *Mr. Spender:* Sir Eric Geddes was strongly opposed, as we understood him, to a state monopoly.

Mr. Lloyd George: Yes.

3970. *Mr. Spender:* He was in favour—

Mr. Lloyd George: I only quoted him on another matter.

3971. *Mr. Spender:* He was in favour of a state establishment, including a laboratory and model workshops, which were to provide all the things which you have just spoken of—jigs and machine tools. He was not at all in favour of going beyond that point.

Mr. Lloyd George: I do not agree with him.

3972. *Mr. Spender:* Whereas Dr. Addison was in favour of taking over all the armament firms. I do not know how far he would have extended it. He was going to pay them compensation; we asked him about that, and he said he would take over all the existing armament firms. Is that your view?

Mr. Lloyd George: Yes, that is my view definitely.

3973. *Mr. Spender:* Perhaps you could help me on this: I do not know how it affects the other Com-

missioners, but in thinking about an organisation for any future war my own difficulty is to discover any idea or theory behind it.

Mr. Lloyd George: Of what?

3974. *Mr. Spender:* Any idea or theory of what another war, if unhappily there was one, would be like. The great trouble in the last war was that nobody had any clear theory—neither the army, nor civilians, nor any country, so far as we know, had any clear theory—of what the war was going to be like; and therefore, if you think state establishments to be the right solution, will not you run the risk of the troubles which you have laid stress on—bureaucracy, red tape, and stagnation?

Mr. Lloyd George: Private firms would not help you in the matter of theory. They had no theory at all; they simply accepted orders from the government. It is the business of the government to make up its mind as to what will be necessary in the way of armaments, which means that it is for them to decide the theory. Private firms have nothing whatever to do with that; they simply take orders.

3975. *Mr. Spender:* All I was trying to get at was this: You have dwelt in your books on the dangers of official control and the great difficulty of getting over official obstacles and red tape. Do not you think that all that would be increased if you have a much larger official system than we had in the last war?

Mr. Lloyd George: I do not know that government arsenals are inefficient, or that they are less efficient than private firms. The men whom I got from the arsenals to help me I found were just as intelligent as the men I met from the private firms.

3976. *Mr. Spender:* But you have spoken rather freely, have you not, about the obstructiveness of officials and the official mind?

Mr. Lloyd George: I have spoken very freely and very candidly about the rigidity of the professional mind, and I am afraid that is not confined to one profession.

3977. *Mr. Spender:* The point I was trying to make was: Would not all that be increased supposing you had all officials instead of one official?

Mr. Lloyd George: I do not know. You might say that the men in the arsenals are all officials; but, as a matter of fact, there are engineers and there are foremen, just like the men you have in Barrow-in-Furness and in Newcastle; I do not know that there is any difference. As a matter of fact, there are men drawn from these government arsenals who are running the show now in the private arsenals. I had the privilege of meeting one the other day, and he was a very able man, but I think his training was in a national arsenal.

3978. *Mr. Spender:* We are not disagreeing about that. I was only asking about what you have said.

Mr. Lloyd George: The rigidity of the professional mind—I do not know that I am unique in the views which I have expressed about that.

3979. *Mr. Spender:* Then with regard to these peace establishments: what is apparently suggested to us is that a government establishment must not merely take over the private firms, but it must make good all the deficiencies which are now attributed to private firms, which would undoubtedly, as it appears to some of us, mean a very large fresh expenditure and also the keeping—

Mr. Lloyd George: In what respect would it mean a large expenditure?

3980. *Mr. Spender:* There would be a large expenditure on one matter—in reserving labour; a large reservoir of labour would apparently be needed and would have to be kept in continuous employment.

Mr. Lloyd George: I do not think that would be so. One of the lessons of the War which has not been pointed out to-day, but it is one which is very evident to those who took part in the manufacture, is that you can very readily adapt the skilled labour in this country to any task. It is about the best skilled labour in the world, and it can adapt itself to any job or to the manufacture of any machine,

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

provided it gets the necessary specifications; and therefore there is not the need for all that reservoir of idle men.

3981. *Mr. Spender*: If we look, for instance, at the evidence given before the Nye Committee in America, the chief pressures on public opinion alleged are not only those of the armament firms, but of the great, heavy industries—iron and steel. Over here we hear of the pressure of the steel industry, which is supposed to be the great promoter of military ideas.

Mr. Lloyd George: Yes; but I fancy that iron and steel would include there the private manufacturers of steel machinery, who undoubtedly made huge profits during the Great War. It is not merely those who turn out iron and steel; it also includes all those who are engaged in the production of steel machinery; and in a country like the United States of America, where everything is in the hands of private firms, there is no doubt that it is an inducement in that case; but if you nationalised the arms industry in the United States of America you would eliminate that prospect from the iron and steel industry, and it would be a very good thing, too.

3982. *Mr. Spender*: You would not he merely transferring the pressure from the armament firms to the government itself?

Mr. Lloyd George: Oh, no. The government's supreme interest is peace, even from the pecuniary point of view. I am talking now of the pecuniary point of view. Their interest is peace; but the interest of the armament firms from the point of view of money and cash is war and preparations for war.

3983. *Mr. Spender*: But in this particular connection what we are thinking of rather is political pressure, the pressure which is put upon the government to keep a dockyard fully employed so that its labour shall not be short of work.

Mr. Lloyd George: We are always confronted with that, and you have a certain number of members always in every House of Commons who are bringing pressure to bear of that kind; but everyone knows that that happens, and I should say that governments discount that particular pressure; but when you have a pressure which is spread all over the country, and you do not know where it comes from, but you have thousands and tens of thousands of people who have a direct pecuniary interest in preparations for war, whose shares go up the moment you talk about preparations for war—they went up, I am told, about £30,000,000 recently—when you think of that, then the pressure is a very different one from the pressure which comes from dockyard constituencies, which everyone discounts.

3984. *Mr. Spender*: When you have a vast institution like Imperial Chemical Industries, whose interests are spread all over the country, that is undoubtedly a firm producing munitions—would you think it necessary to go to the length of creating a monopoly there?

Mr. Lloyd George: I do not know to what extent they actually manufacture explosives. I think they took over Nobel's, did they not? I should certainly eliminate anything in the nature of the production of explosives for war material, and therefore their interests in war-time would not be quite as great as they are at the present moment.

3985. *Sir Thomas Allen*: They told us in evidence that 1 per cent. of their total output was for armament purposes.

Mr. Lloyd George: That is a small percentage. It is very important, if it is only 1 per cent. I should not have thought that would have made all the difference, and I am hoping they will get more and more of an interest in the production of chemicals for agricultural purposes, where there is a vast prospect.

3986. *Mr. Spender*: I am not trying to be contentious on these points; I am only putting certain difficulties which one wants to clear up.

Mr. Lloyd George: I do not mind you being contentious at all.

3987. *Mr. Spender*: You are in favour of complete nationalisation in the same way as Dr. Addison and Mr. Noel Baker?

Mr. Lloyd George: Yes. I read Mr. Noel Baker's evidence, and I thought it was very powerful. I do not say I am in agreement with everything he said, but in substance I am in entire agreement with him.

3988. *Sir Philip Gibbs*: Might I ask you a slightly historical question, which I think is rather important to this Commission and in fact to everyone? Can you throw any light at all on the reasons and the way in which Article 8 (I think it is) of the Covenant was drafted, and of the condemnation of private manufacture and traffic in arms?

Mr. Lloyd George: Which is the article?

3989. *Sir Philip Gibbs*: It is in the Covenant; I think it is Article 8, paragraph (5). It is the article which refers to the grave objections. I was wondering what were the influences and what were the reasons which led the authors of the Covenant to put that in; that is to say, was it based upon evidence, or upon general feeling, or upon historical knowledge?

Mr. Lloyd George: Well, I think it was based on very general feeling amongst all those who took part in the Peace Conference, and there was no protest of any sort or kind from any quarter against this. There was a feeling, to begin with, that Krupp in Germany had had a very pernicious influence upon the war spirit in Germany, and had stirred it up a good deal for their own ends. I have no doubt that in France a good many men like M. Clemenceau, for instance, had the same feeling. Clemenceau knew a good deal more than we did about the influence of that powerful armament interest in France, its influence upon the press; and President Wilson, of course, took a very strong line with regard to it; in fact, there was not one there who did not agree that if you wanted to preserve peace in the world you must eliminate the idea of profit of great and powerful interests in the manufacture of armaments. There was a good deal said about these various firms and their activities, and there was a perfectly unanimous sentiment that this was one of the things that ought to be done, not merely here but also in France, in Germany, in Austria, and in Russia.

3990. *Sir Philip Gibbs*: I asked that question because there has been a certain idea, and it has been written about in various newspapers, that it was merely the idealism of one man like President Wilson.

Mr. Lloyd George: No, that is not in the least true. Krupp were very much in our minds, of course, but I am certain there were other firms, too.

3991. *Sir Philip Gibbs*: I hate going back to this old Mulliner case, which has been referred to several times, but would you agree that it is extremely important, because if the allegations about Mulliner are true it was then a contributory cause of the Great War, because the agitation in England and the public propaganda for an increased fleet stirred up similar agitation in Germany, and immense pressure was put upon the German government and Von Tirpitz to increase the German navy; and therefore it might be said, if there is any truth in the allegations against Mulliner, that he was rather a contributory cause of the Great War. Is that a fair way of putting it?

Mr. Lloyd George: I have no doubt at all that the naval competition between Germany and ourselves was a contributory cause, but I should not say it was merely Mulliner, because there were other influences in Germany operating upon the German government and upon the German press.

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

3992. *Sir Philip Gibbs*: Would you say that the public agitation in England caused by the propaganda did have repercussions in Germany?

Mr. Lloyd George: Oh, undoubtedly, just as the agitation in Germany had repercussions here; because articles in the German press were quoted here, and articles which were written here were quoted in the German press.

3993. *Sir Philip Gibbs*: Therefore I think perhaps you would agree that the Mulliner case is important?

Mr. Lloyd George: It is undoubtedly an element.

3994. *Sir Philip Gibbs*: Is it your recollection—we have all been fumbling for the exact figures—that Mulliner and the propaganda caused by his statements made out that Germany would have 22 Dreadnoughts in April of 1912, whereas they only had nine—is it now within your recollection?

Mr. Lloyd George: I cannot give the exact figure, but the answer I gave to Mr. Spender goes as far as I can remember. There is no doubt at all that Mulliner gave a figure which showed that the Germans would have a definite superiority over us in Dreadnoughts, and the figure he gave was a figure that the Germans did not come anywhere near attaining; but whether it was 22 I cannot remember at this moment. I know it was an impossible figure.

3995. *Sir Philip Gibbs*: I think that is the exact figure.

Mr. Lloyd George: That bears out my impression, that he gave a figure which was not attained, and which was not attainable, as a matter of fact.

3996. *Sir Philip Gibbs*: There is one very important aspect which has not been mentioned this morning with regard to the nationalisation of this industry, and that is the foreign export trade. Are you hostile to the export of arms generally from a moral point of view?

Mr. Lloyd George: No. I should have exported arms to Abyssinia before the war began, and not put an embargo on as we did.

3997. *Sir Philip Gibbs*: Would you go as far, then, as approving of the indiscriminate export of munitions from this country or any other country?

Mr. Lloyd George: No, not indiscriminate. Those are things that the League of Nations would have to thrash out very carefully. There must be some international code with regard to the export of arms.

3998. *Sir Philip Gibbs*: But supposing we cannot get an international agreement, are you in favour of the present system of the export of arms by private manufacturers to foreign countries?

Mr. Lloyd George: I would not have any private manufacture of arms, and therefore the only question is whether you would export arms from government arsenals, and I can well understand that there might be conditions under which it would be desirable that we should.

3999. *Sir Philip Gibbs*: I imagine, therefore, that you are basing your argument entirely on nationalisation, but I was rather hoping to get from you an expression of opinion upon the present system if nationalisation is not possible or is not carried out in this country.

Mr. Lloyd George: That would put certain countries at an obvious disadvantage, and especially the weaker countries, if they were not in a position to purchase arms anywhere, and it would drive them to setting up factories of their own at an extravagant cost, and I do not think that would be a good thing from the point of view of the peace of the world. I think you would have to permit the export of arms under very careful regulations and conditions, and the government is far better able to judge of these than a private firm from the point of view of policy.

4000. *Sir Philip Gibbs*: From the historical point of view, up to the present day, when this free ex-

port of arms is going on in the world, do you think that the traffic in arms abroad has been a contributory cause of wars?

Mr. Lloyd George: Oh, undoubtedly; I should not have thought there was any doubt about that at all. There are many illustrations of that.

4001. *Sir Philip Gibbs*: Would you think, for instance, it was right to say that the building up of the Japanese Navy by a firm like Vickers-Armstrongs had created a new menace in the world?

Mr. Lloyd George: Well, I would not like to go as far as that; because under any system I think that Japan would have had her ships ultimately. Perhaps it precipitated the present condition of things, but I do not think that anything could have prevented it.

4002. *Sir Philip Gibbs*: Do you think that the private export of arms to countries like Serbia, Bulgaria, and Turkey was one of the contributory causes of the Balkan wars?

Mr. Lloyd George: They could not have fought those wars unless arms had been exported to those countries, and if the export were under the control of governments—well, governments would have had some sort of responsibility as to the use which was going to be made of those weapons; and, besides, it would have called their attention to the condition of things, and there would have been a general sense of responsibility. Naturally, a private firm has not to consider these things.

4003. *Sir Philip Gibbs*: Do you think that the nationalisation of the arms industry would entirely abolish many of the grave objections mentioned in that article of the Covenant?

Mr. Lloyd George: I think so. I think that if you abolished the private manufacture of arms there would be a very valuable contribution to the cause of peace—very valuable.

4004. *Sir Philip Gibbs*: Because I imagine that foreign governments might subsidise the press in the same way as private manufacturers do in foreign countries, or in our own country perhaps.

Mr. Lloyd George: That, as you know, does happen in some countries, not in ours; but it does happen. You cannot avoid that, I am afraid; but, at any rate, foreign governments would not do it with a view to provoking war.

4005. *Sir Philip Gibbs*: They might do it with a view to buying an alliance?

Mr. Lloyd George: Yes, they might. You cannot remove every danger to human life.

4006. *Sir Philip Gibbs*: But you do feel generally that a national system would eliminate quite a number of objections?

Mr. Lloyd George: Yes; that is all you can do.

4007. *Sir Thomas Allen*: I want just to ask you one or two questions by way of elucidation. One of the arguments advanced by you in favour of nationalisation is on account of the trafficking in armaments shares. Do you see any way, apart from complete nationalisation, of meeting that situation by some form of legislation that would prevent this trafficking in shares that is now going on and has been going on since the government decided its new armaments programme?

Mr. Lloyd George: That undoubtedly would be valuable; but what makes it very ominous is that this traffic in shares went on in spite of a definite pledge given by the Prime Minister that there would be restriction of profits; and it shows how difficult it is, by means of legislation, effectively to restrict that kind of operation.

4008. *Sir Thomas Allen*: The White Paper* does not cover dealing in shares so much as regulating profits?

Mr. Lloyd George: Yes, that is true.

4009. *Sir Thomas Allen*: Under the new armaments programme do you see the possibility of the elimination of profit under the White Paper regulations?

* Cmd. 5107.

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

Mr. Lloyd George: We did our best to do that with regard to the production of munitions, but we did not achieve the whole object that we had in view, because the armament firms did make enormous profits in spite of all the restrictions that were imposed upon them in the way of cutting down of costs and the excess profits duty and that sort of thing. It is a very, very difficult thing to do. Then there is the additional difficulty pointed out by the Chairman, that a great many of these firms do civilian work as well, and you could not possibly prevent them dealing in their shares if 50 per cent. of their work was civilian, and certainly not if it was 70 per cent. That is one of the difficulties.

4010. Sir Thomas Allen: Short of absolute nationalisation, do you see any way by which this feeling in the minds of the community that this is a business in which excessive profit is made could be removed?

Mr. Lloyd George: I hope you understand that I am not attacking private enterprise. That is not my line at all. I am only talking about one particular business where I think it is very desirable that there should be no private profit. I wish I could see any other way of dealing with the situation, but, short of control of practically every commodity, I do not see how you can do it unless you have this state monopoly.

4011. Sir Thomas Allen: You also said in the course of your observations that armament firms had secret information not available to governments. Is that because they are more internationally minded than governments and have a greater understanding?

Mr. Lloyd George: I did not say it was not available to governments. The armament firms possessed evidence which was in their possession, based on secret information which they had received. Whether it was available to the governments or not, I do not know. We had our information, but our information did not go, I think, as far as that which was conveyed to us by the armament firms—nothing like it.

4012. Sir Thomas Allen: You did rely upon secret information?

Mr. Lloyd George: We had certain secret information, but the evidence possessed by the armament firms rather indicated that our information was not accurate.

4013. Sir Thomas Allen: My point is: Were they in a position to get, because of their international relationships with each other, information which the government were not able to get?

Mr. Lloyd George: That is what we assumed. We did not ask them how they got their information. That is the sort of thing they would not be bound to answer.

4014. Sir Thomas Allen: When you define nationalisation, do I understand you to mean that in peacetime the government should accept sole responsibility and have the sole manufacture of armaments, and then in emergency, in war-time, it should harness the whole industry of the country to state production?

Mr. Lloyd George: That is so.

4015. Sir Thomas Allen: That is what we understand when you speak of a state monopoly?

Mr. Lloyd George: Yes, that is my view.

4016. Sir Thomas Allen: Now with regard to sales abroad under Article 8, paragraph (5), of the Covenant. I think it also says, as far as my memory goes, that regard must be had to those nations which are not producing arms, and, with regard to them, that they shall not be subjected to shortage in supplies?

Mr. Lloyd George: That is right. That would involve export, undoubtedly.

4017. Sir Thomas Allen: It has been put to us that there is a strong objection to export by a government as such, in contrast to export by private enterprise

—that it would involve the government in political difficulties which do not arise in export by private enterprise. Do you see any difficulty in that?

Mr. Lloyd George: I do not see any difficulty at all. So long as nations are at peace you are entitled to sell any articles to another nation. If you are on friendly terms with them I do not see why there should be any difficulty about that.

4018. Sir Thomas Allen: Your view is that sales should be by one national government to another?

Mr. Lloyd George: Yes—of armaments.

4019. Sir Thomas Allen: Another objection raised against nationalisation has been that government departments do not reward their servants or give consideration for enterprise in design and constructiveness; that the system is altogether against inventive enterprise in the national system as contrasted with the private system. Can you see some other way than the present system of reward for enterprise being forthcoming under a national system which would encourage every effort?

Mr. Lloyd George: I think there are rewards given. I forget for the moment whether they are confined to those who are not in the service of the Crown, but I remember, as Chancellor of the Exchequer, that I had to sit upon one or two cases to adjudicate the amounts to be paid for an invention; so I think that rewards are paid, and I think it is right that rewards should be given. Sometimes a reward might be pecuniary; sometimes it might be in the form of an honour.

4020. Sir Thomas Allen: Or advancement?

Mr. Lloyd George: Yes; but I do not see why it should not be pecuniary in certain cases.

4021. Professor Gutteridge: I think that large amounts were paid to the people who were concerned with the tanks, people like Major Wilson, and so on.

Mr. Lloyd George: That is right; and it was well worth the money.

4022. Sir Thomas Allen: I was not thinking so much of what might be done in war-time, but of a system in peace-time which would encourage enterprise.

Mr. Lloyd George: I am all for it.

4023. Sir Thomas Allen: It has also been put to us that under a national system the government would have very much greater trouble with labour than private enterprise; that there would be demands made upon a national organisation; that there would be political considerations which would enter into it, and that strikes would probably be more numerous under a national system than under a system of private enterprise.

Mr. Lloyd George: I do not think that that is quite the experience in these matters. We did not have more trouble with arsenals than we had with private firms. We had very considerable trouble in Glasgow and in Sheffield and in Coventry, and I am not sure that we did not have it in Barrow-in-Furness—but I am not quite sure of that—with private firms.

4024. Sir Thomas Allen: I think I can say again at this juncture that I have been very much impressed, sitting on this Commission, with the ability of former government officials who have passed away from government service and have gone into private enterprise.

Mr. Lloyd George: That is right.

4025. Sir Thomas Allen: I have thought in my own mind that if the government had cared to harness those gentlemen to a national system they could have served the state equally as well as they serve private enterprise.

Mr. Lloyd George: That is quite right.

4026. Sir Thomas Allen: What I want to ask you is this: If the government made up its mind upon this national policy and said "Go," whether you would find in the three services men who would respond to that request most readily, just as they do for private enterprise.

Mr. Lloyd George: I have not the slightest doubt about it; and, to corroborate what you said, some of the men who are now engaged in the

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

private firms have been drawn from the services, and very able men they are.

4027. *Professor Gutteridge*: Can you tell me this: When paragraph (5) of Article 8 of the Covenant was under discussion, was there any inquiry into the nature of the grave objections, or anything of that kind—were they dealt with categorically, or were they simply dealt with generally as a whole? Can you remember that?

Mr. Lloyd George: Each article in the Covenant was discussed with great elaboration and care.

4028. *Professor Gutteridge*: But you cannot recollect whether there was any investigation?

Mr. Lloyd George: No; there would be no investigation.

4029. *Professor Gutteridge*: That is what I meant; it was based on an impression?

Mr. Lloyd George: It depends on much more than impression; and, after all, they were men who had considerable knowledge.

4030. *Professor Gutteridge*: You refer to M. Clemenceau?

Mr. Lloyd George: Yes. He knew pretty well what was going on; no one knew better.

4031. *Professor Gutteridge*: I have always understood—I may be wrong—that the idea of this paragraph came directly from President Wilson.

Mr. Lloyd George: I am not sure about that. 4032. *Professor Gutteridge*: There is an American lawyer—I think his name is Miller—who has written a book on the subject, and he attributes the origin of this to President Wilson.

Mr. Lloyd George: All Americans would!

4033. *Professor Gutteridge*: You do not know whether that is correct or not?

Mr. Lloyd George: No.

4034. *Professor Gutteridge*: I do not know whether I quite understood your point of view. I do not think you went so far as to say that there were no inventions utilised during the War which came from the armament firms?

Mr. Lloyd George: No, I did not say that.

4035. *Professor Gutteridge*: For instance, there was the 9-inch gun, which has always been said to be the best gun on either side during the War. That was the invention of Vickers.

Mr. Lloyd George: The 9.2?

4036. *Professor Gutteridge*: Yes.

Mr. Lloyd George: Yes; but there were others which were not as good, also inventions of armament firms. I could name them if you like.

4037. *Professor Gutteridge*: The Lewis gun was an American gun, was it not?

Mr. Lloyd George: I think we had to buy it from outside; I am not sure. I do not think it was invented by an armaments firm.

4038. *Professor Gutteridge*: The Rolls Royce engine was the best aeroplane engine during the War beyond doubt, was it not?

Mr. Lloyd George: It was supposed to be.

4039. *Professor Gutteridge*: Sometimes they invented things, and sometimes they were invented outside the armaments firms.

Mr. Lloyd George: Take the 6-inch howitzer, which was on the whole the best gun we had. I think that was invented by the service after very elaborate experiments. We depended far more on that than on any other gun. The other was a first-class gun, but we depended on that far more.

4040. *Chairman*: May I just ask one or two questions, quite shortly; first of all, with regard to the export of arms. In your view, it is not possible to abolish the export of arms altogether?

Mr. Lloyd George: I think it would be undesirable. I agree with this article of the Covenant that you must make provision for those who have not manufactures.

4041. *Chairman*: If you assumed a state monopoly and the abolition altogether of the private manufacture of arms, the only business or the only source

from which anyone could obtain arms would be the government factories—some government factories?

Mr. Lloyd George: That is right.

4042. *Chairman*: It has been pointed out to us, or suggested to us, that that would inevitably lead, or would very probably lead, to diplomatic difficulties. I will give an instance: It is said that supposing a government applies to a manufacturing government for a supply of arms, and the applicant is perhaps ranged on the side of a country which that manufacturing government may not think is friendly, and they say: "We cannot supply you with any arms," and then that state goes to No. 2 manufacturing government and says: "Will you supply us with arms?" and they say: "Oh, yes, we will!"—it is suggested that the first government which refused to supply the arms might treat the act of the second government which agreed to supply them as an unfriendly act, and in that kind of way you would find considerable difficulties.

Mr. Lloyd George: By "unfriendly" you mean a case where we have an actual dispute with another country?

Chairman: Yes.

Mr. Lloyd George: Which might mature into a quarrel?

Chairman: Yes.

Mr. Lloyd George: I cannot imagine them coming here to buy arms.

4043. *Chairman*: No, not coming here, I agree; but other people may be only too glad to make a profit out of the manufacture of arms.

Mr. Lloyd George: That is what they do at the present moment.

4044. *Chairman*: Yes, true.

Mr. Lloyd George: A quarrel of that kind is probably a quarrel which would come within the cognisance of the League of Nations, and during the dispute I think it is very probable that all governments would agree not to supply arms. They went as far as to do that in the Italian dispute before there was war declared; they even prevented private manufacturers from supplying arms; and if you can do that at the present moment with private manufacturers I do not see why it could not be done by governments if there are disputes going on at the time, and I should say it might be useful. Take Bolivia and Peru; supposing they were on the brink of another quarrel with each other and were going to fight, there might be a kind of understanding between the manufacturing governments that they should not supply either with arms; whereas they would not like to go to the extent of putting an embargo upon the sale by private firms; but if it was in the hands of a government there could be an understanding that neither of them should be supplied with arms. As a matter of fact, the arms in this case were supplied by private manufacturers, and the governments did not quite like to stop it; they said that was private enterprise and private business, and did not intervene. They would have intervened long before the war, and probably before the trouble became aggravated, if the supply had been by governments. The government of the United States of America, for instance, would have stopped the exportation of arms, and probably communicated with us and with France and with the rest, and would have said: "We hope you will not supply these people because they are working up a war." I think you would have far greater control over the international system if you made the manufacture of arms a national monopoly. Governments would then have a direct responsibility. Of course, there is not enough profit in it for a government in any event to endanger peace.

4045. *Chairman*: One other question on another matter, with reference to the employment of service officials in private firms, leaving the service and being employed by private armament firms. Of course, if you adopted a monopoly the question would not arise?

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

Mr. Lloyd George: No.

4046. *Chairman:* But assuming that a system is continued of state factories and private manufacturers working in collaboration, it is in the interests of the state, is it not, that private manufacturers should be as efficient as possible because it is in the interests of the state that they should be as efficient as possible?

Mr. Lloyd George: Yes.

4047. *Chairman:* And therefore that they should get the best assistance they can from whatever source—and there is no source from which they can get efficient assistance except from the services, because it is only the services which have the practical knowledge.

Mr. Lloyd George: I think it is a very bad system. I do not think that state officials ought to have it in their minds that after they leave the particular department where they are exercising control they should be engaged in high positions with firms which will pay them twice or three times as much as they were paid in the civil service. I do not say that it will influence them, but I do not think they ought to be put in that position, and if you had state-owned establishments you would remove that kind of temptation. I have always thought it was a bad system.

4048. *Chairman:* I want to ask you one further question about that. The army and navy are not very attractive services now, are they—I mean from the point of view of a man's future; he is turned adrift very often and finds it very difficult to get anything to do. Supposing you were to make some sort of rule that a man who had once entered the service should not go into the service of an armament firm, it would deprive able young men, would it not, of an opportunity that they might look forward to, even if it influenced their careers in the army or the navy?

Mr. Lloyd George: That is an additional reason for nationalisation.

4049. *Chairman:* I agree. Directly you arrive at a monopoly the whole difficulty would disappear?

Mr. Lloyd George: Yes, that difficulty goes. I think it is rather hard that they should be ruled out from prospects of that kind, but they would not have them if you had a state monopoly.

4050. *Chairman:* Another point is this: Of course, so long as there was competition between the armament firms it might be an objection that a man from the services should go to a particular armament firm, because he would perhaps be able to use his influence with a friend in office that his particular firm should be the selected firm; but now, when all competition between these armament firms has disappeared, and whatever orders are going they distribute amongst themselves, that objection has disappeared, it seems to me, because a man gets no advantage from having a friend in office if the order, or whatever it is, is to be distributed amongst them under this new system.

Mr. Lloyd George: That may be true; but it is much more far reaching than that.

4051. *Dame Rachel Crowdy:* I think you said that if there was nationalisation of manufacture most of the objections connected with the export of arms would be done away with, but not quite all, or possibly not all?

Mr. Lloyd George: Yes, that is right.

4052. *Dame Rachel Crowdy:* It would be right to say, would it not, that touting for orders in foreign countries would be done away with under a government monopoly; one cannot conceive of any government deliberately touting for orders in another country?

Mr. Lloyd George: No.

4053. *Dame Rachel Crowdy:* Particularly if their diplomats were sitting at Geneva trying to make peace between the countries concerned?

Mr. Lloyd George: The interest of the government is not to have trouble between nations, and the

profit that they would make out of it would be insignificant.

4054. *Dame Rachel Crowdy:* Do you think, too, that it would do away with all these attempted evasions of embargoes?

Mr. Lloyd George: Oh, yes.

4055. *Dame Rachel Crowdy:* You cannot conceive of a government trying to set up a factory in another country in order to avoid an embargo.

Mr. Lloyd George: And selling arms which are used against us in some parts of our Empire. That has been especially the case on the North-West Frontier of India and other places.

4056. *Dame Rachel Crowdy:* That was almost my next question; I was going to ask you if you knew of any cases where arms had been sold either during war-time or during peace-time by our own firms to be used against us.

Mr. Lloyd George: I could not say during war-time, but during a time of nominal peace actually arms have been sold which have been turned against us ultimately.

4057. *Dame Rachel Crowdy:* With the knowledge of the firms that they might be turned against us?

Mr. Lloyd George: They must have had that possibility in their minds, especially on the North-West Frontier.

4058. *Professor Gutteridge:* They would be second-hand arms, would they not?

Mr. Lloyd George: Mostly, I should say.

4059. *Dame Rachel Crowdy:* I was not thinking of second-hand arms; I was thinking of arms that were sold by private manufacturers in country A to country B with the object of country B sending them to country C, where they would be used against us. I was thinking of something rather more far-reaching than that Professor Gutteridge has in mind.

Mr. Lloyd George: Yes. I have not a case of that kind in my mind.

4060. *Mr. Spender:* Would not Turkey be a case in point? We undertook the supervision of the Turkish navy in 1912, did we not?

Mr. Lloyd George: Yes.

4061. *Mr. Spender:* And I think that some of our own shells were actually used in the Dardanelles against us?

Mr. Lloyd George: Yes.

4062. *Mr. Spender:* That was the government, was it not—it was not a private firm?

Mr. Lloyd George: I do not know whether the government sold any arms.

Mr. Spender: The government undertook to keep the Turkish navy in good condition and to supply it with munitions.

Professor Gutteridge: I think there were British naval officers actually on board the Turkish warships when war broke out.

Mr. Lloyd George: I see.

4063. *Dame Rachel Crowdy:* We have been told very often that the abolition of the private manufacture of arms would make for unemployment. Would you give us your comments on that?

Mr. Lloyd George: I cannot imagine why, because the government makes up its mind each year how much it is going to spend upon armaments as a matter of public policy, and you require the same number of men to work on these projects whether the orders are executed by the government or whether they are executed by a private firm. I do not see why there should be unemployment.

4064. *Dame Rachel Crowdy:* You feel that the government would employ as many men as are employed by private firms?

Mr. Lloyd George: Certainly.

4065. *Sir Thomas Allen:* I think the real point was that because of the private system of manufacture the employees could change over to other work which could not be done in a national factory engaged solely upon the creation of arms; they would have to stand off; whereas private manufacturers could put them on to some other work.

6 May, 1936.]

The Right Hon. DAVID LLOYD GEORGE, O.M., M.P.

[Continued.]

Mr. Lloyd George: They would have to concentrate upon manufacture for civilian and other purposes, just as Krupps had to immediately after the War.

4066. *Sir Thomas Allen:* Would you, then, support the idea that national armament factories should not be disallowed, at any rate, the right to manufacture other commodities?

Mr. Lloyd George: I should be very doubtful of the wisdom of allowing them to go into the competitive market with government support. It is one thing to have a complete system of nationalisation, but I do not think it is a good thing to have a system whereby you should subsidise particular

firms which are competing with others, but they might manufacture things which are used for government purposes.

4067. *Sir Thomas Allen:* The government is a large buyer; for instance, the Post Office?

Mr. Lloyd George: Yes. There are a great many things they buy.

4068. *Sir Thomas Allen:* You see no objection to them manufacturing for state purposes?

Mr. Lloyd George: For state purposes, no; but I should think it would be unfair of them to manufacture and go into the competitive market.

Chairman: I think that is all, and we are much obliged to you for coming.

(Adjourned for a short time.)

On resuming—

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired), called and examined.

4069. *Chairman:* I understand you have prepared a statement, Captain Llewellyn?

Captain Llewellyn: I have, Sir.

4070. *Chairman:* Do you wish the Secretary to read it?

Captain Llewellyn: I think, Sir, if the Secretary read it, it would be more readily understood.

4071. *Chairman:* Very well.

The following statement was read:

The following is a statement of my experience in connection with manufacture and purchase of arms and munitions of war.

10 years Assistant Inspector and Inspector of Naval Ordnance at Woolwich Arsenal, at Sheffield and at Newcastle and Glasgow.

8½ years at Admiralty as Chief Inspector of Naval Ordnance with charge of all inspection of naval ordnance, mines, torpedoes, bombs, &c., and explosives and propellants.

8½ years Associate Member of Ordnance Committee.

8½ years member of sub-Committee of Committee of Imperial Defence dealing with actual and potential resources for the production of warlike stores for all services.

Private Manufacture and Trading in Arms.

It first becomes necessary to define what constitute "Arms" as it is certain that even if firearms, explosives, etc., are not available war may still be waged with sticks and stones; for practical purposes I would confine my remarks to finished ordnance, rifles, torpedoes, mines, bombs and shell, their propellants, explosives and components and to such material as may be readily completed into such stores, for example—gun and rifle barrels or tubes, punched and drawn shell hodies, mine spheres, torpedo air vessels.

If restrictions are to be effective then they must apply not only to the finished article but to the semi-finished material and relative components. For instance a gun up to 6-inch bore can be built up with prepared tubes in a few hours, or at most, days with very limited resources. I would therefore recommend that all vital components in any stage of manufacture that will permit of assembly into completed articles for use should be classed under the same heading as the finished weapon.

As to the advantages and disadvantages of state versus private manufacture and sale the following is a summary of views based on experience, with some reasons and facts.

ADVANTAGES.

State Manufacture.

(a) Some form of state factory is essential for production of trial and experimental stores, for repairs, for maintenance and for providing information essential to a proper check on costs, times and ease, or otherwise, of manufacture.

(b) Manufacture in state factories permits of work being kept secret, of improvements in methods, pattern and use being retained solely for the use of the state.

(c) Eliminates the incentive to fake or conceal defects on a large scale (petty fraud by individual workmen must always be guarded against whether in a state factory or not).

(d) A better control over progress is possible as the work has not to take its place with commercial and foreign orders, and changes in design that it may be desired to introduce while work is in progress can be more readily and effectively carried out at less cost.

(e) Strikes are less likely, lock-outs do not occur, and programme dates of completion, etc., are more likely to be adhered to, that is if the state factory is capable of producing from the raw material stage.

DISADVANTAGES.

State Factories.

(1) Concentration—but as matters stand this objection does not operate as trade manufacture is, with the exception of explosives and propellants and certain stores of lesser importance, in the hands of one combine and its associated companies. (Shell are not made at present by the combine—Vickers-Armstrongs—but by Hadfields and Firths; this it is understood is by arrangement between the companies, i.e., there is no competition and intense concentration). Moreover it is not advocated that the state should produce in a single factory or in a factory organised on the lines of Woolwich Arsenal which does a little of all or most classes of work. As to capacity for expansion the present state of affairs does not allow of rapid conversion to war output and utilisation of commercial resources, in that the bulk of trade production is in the hands of Vickers-Armstrongs, and therefore distribution of staff and key workmen would be less readily carried out than would be possible if the nucleus were held in a state factory. Generally on this point of concentration the advantages appear to be with state manufacture.

(2) Cost—here the advantage lies with trade manufacture unless the state factory is to be equipped and organised for production in peace time or a semi-commercial basis, i.e., for manufacture of material other than that of a definitely warlike character, and this could be done. For example, now all dockyard-built ships are supplied, or rather built from material made by contract, that is the plates, shafts, armour, etc., etc., but the plant required for heavy shafting is identical with that used for gun forgings, while that for the steel, i.e., the furnaces, primarily and principally, can be used for all purposes where medium or high quality steel is employed. For example, a furnace turning out steel ingots intended for rolling to sheets will also produce steel suitable for H.E. shell. In fact a state factory primarily intended for war stores production can, when orders for such stores

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

are slack, produce a variety of other stores required for state use but at present bought. As to explosives the state at present is almost entirely dependent on trade supplies, again a combine, and has no available facilities for expansion of production, so that if it is concentration that is the disadvantage of state manufacture then we already have the full disadvantage under present conditions.

Further on the question of cost and efficiency, it is generally claimed by opponents of state manufacture that the state cannot produce as cheaply as the trade and that private enterprise gives progress in development which is not to be obtained from state factories. Figures and facts disprove these contentions. For example:—Woolwich Arsenal can and does produce at costs below the trade, that is when conditions are brought to a like basis, it being remembered that an organisation like the Royal Arsenal has a variety of functions to perform that no factory pure and simple is laid out for, or could carry out. Another example is that of Holton Heath cordite factory where the whole of the propellant requirements of the Royal Navy are produced. The price per lb. at which propellant is now being made would astonish trade producers, and many millions have been saved to the state by this factory in the past 17 years.

Moreover as to quality I may say that between 1895 and 1917 no advance was made in quality of propellants (during this period supplies were very largely obtained from private makers), and in 1917 it was found that not only was quality so bad as to be dangerous but that trade factories could not meet our quality requirements. The most revolutionary advances in manufacture have resulted from this state undertaking, and the whole progress, development and production has been the work of state servants. The Royal Naval torpedo factory is another good example of what the state can do in its own factory with state employees.

Another point in favour of state manufacture is the fact that the state is able to choose the location, size and nature of its factories—they need not be, as is essential in trade manufacture—in the large industrial areas mixed up with general commercial work, a great disadvantage. They can be placed in strategically suitable places and can be built in units designed for rapid expansion of skeleton working.

It must be remembered that in 1914-18 armament plant held by private makers did not lend itself to rapid and economical development, and had expansion and development been left to private enterprise the War would have been lost by 1916, in fact private manufacture failed when the load was applied.

ADVANTAGES.

Private Manufacture.

1. As a trade it offers opportunities for profit and is a means of increasing our export figures.
2. If in the hands of a number of manufacturers not working in rings or arrangements or combines then it ensures fair competition and lessening of costs with the maintenance of quality.
3. If in the hands of a number, etc., etc., it allows of wide distribution of work (not so now when armament work has ceased to be the trade of a dozen and is that of but a few).
4. It stimulates foreign trade in that those who tout and sell their arms more usually also have to offer stores of a purely commercial nature.
5. It widens the field for invention and research (but not to the extent that some manufacturers have claimed observing that the ideas, requirements and function of all war-like stores must, and do, primarily depend on the conditions of use and knowledge thereby acquired, i.e., the state).

DISADVANTAGES.

Private Manufacture.

- A. Leaving out all question of profit from the making of appliances intended for the destruction

of human life there appears to me to be definite evidence that the *sale* (and it is the offering for sale and selling rather than the making, that is more objectionable) of arms has increased the possibilities of war even if it has not actually caused war. For example, take Japan; but for the supply of arms and arms making plant and of staff to run such plant and teach the native workmen, it is obvious that Japan with its lack of mineral and material resources could not have become the menace to eastern peace that she has. Without the private sale of arms the South African war could not have taken place. Turkey, Bulgaria, Serbia, Roumania, Greece, Afghanistan, Bolivia, Paraguay, etc., etc., could not have embarked on their various wars during the last 50 years—the whole of the war requirements of their countries (as also China) were supplied by purchase from armament firms. If we stop private sale we stop small wars and it is small wars that lead to large, e.g., Serbia in 1914-1918, Italy and Abyssinia, and its risk of another European war. The evidence seems to clearly show that state manufacture will act against war risks, provided that it is the state only that sells and that sale from government to government be only through a committee of the League of Nations. Isolated action by one or two nations will only result in building up foreign production facilities and foreign profits.

B. Monopoly—this is a decided disadvantage of private manufacture. At present the state must not only buy all its raw material from the interested trades but also the bulk of its finished material, for example—gun forgings; these are almost entirely supplied by the Vickers combine, as also armour plate, explosives, torpedo air vessels, mines, bombs (shell by other trade concerns) and without the state being able to depend on competition in either price or rate of delivery. For example, *heavy armour piercing shell*, the essential weapon of our capital ships—these are solely produced by Hadfields Ltd. and Thos. Firth Ltd., both Sheffield firms, and working together. So complete is the monopoly strength of these firms that they have been able to dictate at will; for example, it is said that the A.P. shell is merely a patent—it is not—it is an article which entirely depends, for its efficiency, on the secret heat treatment it receives.

C. It is undesirable to allow private manufacturers to make profit on information obtained *free* from government sources, such however is the case—the private maker has no knowledge of USE, he obtains this from contact with government officers, from making government stores and from use of government designs and specifications; how else can he get it? For example, the modern shell is made by Messrs. Hadfields and Messrs. Firth, but these concerns do not possess a gun to fire from, a plate to fire at, or a pit or cell to fire into. Again, private makers of arms rely largely for technical knowledge on the officers of the fighting services whom they take into their employment. Vickers have many ex-officers including ex-inspectors, an ex-vice-president of ordnance committee, an ex-director of naval ordnance and an ex-member of army council. This appears undesirable especially when such officers have been—only a short time previous to engagement by the contractor—actually in a position to distribute government orders. A considerable interval should elapse between leaving state service and employment by a state contractor, but the system would disappear if state manufacture replaced private and then if expansion for war became necessary the essential technical assistance to the reserve or improvised factories could be directly provided by the state.

D. Quality—where manufacture is primarily for profit the first consideration must be low cost and saving on all possible occasions, i.e., minimum cost and minimum quality within the specification and the tendency is to try and get the state to accept something not quite as good as it should be; this tends to dishonesty on the part of individuals particularly

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

when employed on a "tonnage" or output basis. I never encountered any deliberate attempt at concealment or malpractice or any attempt to force the acceptance of faulty material in a government factory. Moreover the employment of officials and workmen on an established basis, as in H.M. Dockyards, etc., tends to the production of sounder work, the workmanship is much the same but the product of government employees is, in my experience, more to be relied on.

E. Secrecy—private makers work foreign and British contracts side by side and it is impossible to preserve entire secrecy. For example in 1913 we were making 15-inch guns described and referred to as 13.5 inch, and in the same shops were guns 12-inch and 13.5-inch for the Japanese and Turkish governments; and similar work for Chile and Brazil. I personally saw a Japanese endeavour to take measurements of our drawings.

In 1921 we developed a new 8-inch gun and a few were ordered from Armstrong Whitworth—almost immediately an order for two 8-inch guns was placed or rather offered to this company provided that they were made at Newcastle (where our own order was to be executed). Sir W. G. Armstrong Whitworth & Co. declined the order on such terms. At the outbreak of war in 1914 the Turkish government had under construction in this country, two battleships armed with 13.5-inch and 6-inch guns identical with latest Admiralty design with shell and ammunition to suit. At the same period the Japanese had guns identical with our current designs as also the Chileans, Brazilians Argentines, Greeks, but the designs were not supplied from our government to them; and it is certain that the designs were not the production of the governments mentioned.

If each improvement in design is to pass to the trade and is to be offered by the trade (possibly with slight modification) to foreign governments: then such governments will buy and the armament race proceeds. If there is no sale then the smaller states cannot manufacture themselves and must gradually cease to be armed and many of the causes of war or threats of war will disappear. I submit that it is well to keep manufacture and sale as distinct.

4072. *Chairman*: In the last four lines you say, "If there is no sale then the smaller states cannot manufacture themselves and must gradually cease to be armed." That is pretty self-obvious, but what do you mean by "sale"? Do you mean sale by private manufacturers or sale by anybody?

Captain Llewellyn: Certainly sale by private manufacturers, and sale by government under conditions which were prevailing at the time and which were considered expedient.

4073. *Chairman*: I am afraid I do not follow.

Captain Llewellyn: My view was that the sale by private firms should cease, that, as I stated in the previous part of my evidence, the sale by the state should be regulated by a committee of the League of Nations or an international court which would decide as to the advisability or otherwise of each particular small nation having the arms they claimed.

4074. *Chairman*: Do you think you would ever get a consensus of opinion as to whether a state should have arms or not?

Captain Llewellyn: Judging by recent events I should say it is problematical.

4075. *Chairman*: Probably not?

Captain Llewellyn: Probably not.

4076. *Chairman*: We do not get much further forward then, by this suggestion?

Captain Llewellyn: We get further, to the extent that if private firms are not able to sell we do away with many of the disadvantages which are attached to the private offering of arms; that is the incentive to buy.

4077. *Chairman*: Yes. That is another question altogether, but on this question of there ceasing to be war because the state will not be able to

obtain arms, that depends not only upon the stopping of private manufacture but upon some general international consensus of opinion as to who shall have arms and who shall not.

Captain Llewellyn: Yes. If I may say so, the whole question of peace or war depends upon some form of international agreement.

4078. *Chairman*: Very well. May I turn back to where you are referring to the question that nowadays there is no competition in state factories?

Captain Llewellyn: Yes, Sir.

4079. *Chairman*: And you apparently hold the view that is very generally held that there is a great advantage in having competition if you want to regulate prices.

Captain Llewellyn: That was the experience before the War. There was quite considerable competition and very keen competition on the part of certain firms who were not in any combine or pool arrangement with the others, and it was distinctly open competition both as to price and rates of delivery.

4080. *Chairman*: Sir Eric Geddes put before us a new view altogether—at least, it was new to me; I do not know whether it has come before you. His view was that under present conditions, where a firm is in a position to undertake mass production and accurate costing, it is really better that the government, or whoever is the purchaser, should deal with one firm rather than with a number by way of tendering. This is the way he put it. He said that a firm that produces by mass production and can accurately cost every part of the process of production can tell to a penny what a thing costs them. Smaller firms who are not in the same position cannot manufacture so cheaply. Firm A—that is the big firm—knows from its costing that the smaller firms cannot produce other than at a price which, we will say, would be certainly 20 per cent. more than that at which they could produce, and therefore the larger firm says, "I am bound to undercut because I can produce 20 per cent. cheaper than they can, but if I quoted 15 per cent. above what I can manufacture at, and should be prepared to sell at, I would still be undercutting the smaller firms, and therefore I could get the contract and supply the article at a price higher than that at which I should have supplied it if the agreement had been that I should supply at a fair price to be ascertained by costing." That is rather a long statement; do you agree with that view?

Captain Llewellyn: Not altogether, Sir. The larger the plant and the more economically it is laid out the lower the cost of production, but that carried to the extreme places the state in the position of having to deal with one monopoly firm which says, "Very well, you cost our accounts. You offer us such and such a price." But they are in a position to say "We will not manufacture."

4081. *Chairman*: If you get to that stage, of course, you must nationalise, because you cannot get the goods, but short of that, merely on the question of price—

Captain Llewellyn: On the question of price, the larger the plant or the larger the facilities for laying out your plant, generally speaking, the lower the cost of production. But that does not altogether apply to certain classes of manufacture. There are certain classes of manufacture, certain stores which can be produced in small quantities if the first unit of plant is available, they can be produced at the same cost as that of the bigger stores. Take such a thing as a heavy gun. If you have the essential facilities for building one sixteen-inch gun, those same facilities will turn out 8 to 10 of those guns in a year and at a cost no more than if you had four of those units and were turning out 32 to 40 of those guns in a year. If it comes to smaller stores such as fuses or cartridge cases, the plant is not a very expensive one. It has been laid out, and was laid out in the late war, more or less on the basis of the unit.

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

If you have a unit you can produce at an equal price in competition with the man who has 10 units; but if you have only a scrap unit made up of a collection of units, which was the position in 1915 and 1916 when all the odd machines in the country were put together to make units, then production is not so economical.

4082. *Chairman*: Then there is a passage in the next part of your statement dealing with capacity for expansion. You say "As to capacity for expansion, the present state of affairs does not allow of rapid conversion to war output and utilisation of commercial resources, in that"—this is the reason, is it not?—"the bulk of trade production is in the hands of Vickers-Armstrongs and, therefore, distribution of staff and key workmen would be less readily carried out than would be possible if the nucleus were held in a state factory." Does that mean that, because Vickers do so much civil work and because so many of their people are engaged in civil work, therefore they will not be able to expand as rapidly as a state monopoly. Is that it?

Captain Llewellyn: No, Sir. My intention was to convey the fact that, in the early days of the War, when factories were being set up and when firms which were not accustomed to munitions manufacture were brought into the business, it was difficult to induce the more experienced firms to part with their key men in order to show the new firms how to do the work; whereas with a state factory you can draft your men here and there, as required. Considerations of what is to happen to those men and their knowledge if they are transferred to a potential competitor do not enter into the question.

4083. *Chairman*: Most people assume that, in the event of war, there would be some form of conscription by which men would be moved about among private firms as well as others. Of course, we have learnt a lot by our experience in the last war.

Captain Llewellyn: Have we profited by that experience?

4084. *Chairman*: With regard to cost. You say "In fact, a state factory primarily intended for war stores production can, when orders for such stores are slack, produce a variety of other stores required for state use but at present bought." To what sort of things are you referring there?

Captain Llewellyn: Take furnaces employed for the production of mild steel for producing the ordinary high explosive shell. The bulk of that steel in the late war was produced by furnaces which had been employed up to that time for the production of steel rails, angles, bars, steel used in bridge building, railway lines and a variety of other commercial purposes, including shipbuilding. Those same furnaces could be employed for commercial work or for making certain types of definite armaments stores.

4085. *Chairman*: You are contemplating that this plant could be put to use to manufacture commercially?

Captain Llewellyn: I would not go so far as to say that they should be in competition with commercial manufacture, but there are a very large number of colonial and colonial government orders which at present go abroad, and my idea was that that if the state factory were slack on armament work, it could fill in with its available plant and occupy it with orders of a state nature which should, under normal circumstances, be sufficient to keep a nucleus staff fairly well employed.

4086. *Chairman*: You assume orders and you assume that they are non-commercial orders sufficient to keep the thing going?

Captain Llewellyn: I am assuming that the state factory I had in mind would be one which, taking a normal armament production over a period of years, would be fully employed.

4087. *Chairman*: I have never heard of this cordite factory at Holton Heath. Is that a government factory?

Captain Llewellyn: It is entirely a government factory, under the Admiralty.

4088. *Chairman*: What other factories are there for manufacturing cordite?

Captain Llewellyn: At Waltham Abbey there is a small factory for the production of army cordite and Imperial Chemical Industries have a factory at the lower end of the Firth of Clyde—Ardeer.

4089. *Chairman*: We were told about other cordite factories?

Professor Gutteridge: There was one at Stockton-on-Tees?

Captain Llewellyn: There were several. There was one at Southampton, there was one at Chilworth. I have not in mind all of them, but there were 6 or 7 before the combination of the big explosive firms into one combine. At that time the government requirements were obtained either from Waltham Abbey—which could only produce a very small amount—or by purchase from the trade. The result was, when it came to the War, that the requirements could not be met and large purchases were made in America at very high prices, and eventually Gretna was set up, at a very high cost.

4090. *Chairman*: Cordite production is now in the hands of Imperial Chemical Industries, is it not?

Captain Llewellyn: Yes, with the exception of the Admiralty's requirements, which are entirely met through the state factory.

4091. *Chairman*: Imperial Chemical Industries are in a position to manufacture satisfactory cordite?

Captain Llewellyn: For the army.

4092. *Chairman*: Or for the navy.

Captain Llewellyn: No. The conditions of manufacture of the types of propellant are so different that it was decided by a committee that sat in 1919 that a continuation of the Holton Heath factory under Admiralty control was essential.

4093. *Chairman*: So far as it is not already manufactured by government, there is no reason to assume that it would not be satisfactorily manufactured by Imperial Chemical Industries to meet such requirements as there are?

Captain Llewellyn: What their capacity now is I do not know but, judging by the requirements of the late war, I should say their capacity is not 1-50th of what would be the demand in a war on a scale such as the last one.

4094. *Chairman*: You say "It must be remembered that in 1914-18 armament plant held by private makers did not lend itself to rapid and economical development, and had expansion and development been left to private enterprise the War would have been lost by 1916." Everybody seems to agree that nobody anticipated either the amount of the demand or the rapidity with which development would be required. That is right, is it not?

Captain Llewellyn: Yes, Sir.

4095. *Chairman*: The private manufacturers failed because they did not anticipate and get ready. If the government monopoly had been in existence at that time and they had not anticipated it, they would have been in the same difficulty as private firms, would they not?

Captain Llewellyn: Not fully, I think. The state would then have had a number of key men available for distribution, which they had not. They would have had the accumulation of tools, gauges and other stores incidental to starting manufacture, which were held by a few individual firms and were not available for distribution. That alone would have ensured a six months earlier start with the big output than was possible under the conditions then operating.

4096. *Chairman*: But unless the government had anticipated what was to happen they would not have had the gauges to distribute.

Captain Llewellyn: It was the custom for each store to hold a duplicate set of gauges in addition to those required for their own operation but it was not considered necessary for the manufacturer to hold more than the two sets of gauges.

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

4087. *Chairman*: But such gauges as the government possessed they wanted themselves when war broke out.

Captain Llewellyn: Those gauges were issued but the change of pattern was the trouble we were up against in 1915.

4098. *Chairman*: Under the head "Private Manufacture: Disadvantages," you say "Leaving out all question of profit from the making of appliances intended for the destruction of human life there appears to me to be definite evidence that the sale (and it is the offering for sale and selling, rather than the making, that is more objectionable) of arms has increased the possibilities of war even if it has not actually caused war. For example, take Japan; but for the supply of arms and arm-making plant"—and so forth. Then you go on to say "Without the private sale of arms the South African war could not have taken place." Then, Turkey, Bulgaria and all the rest of them would never have gone to war. But that assumes, does it not, that nobody else would have supplied them with arms? Supposing the private manufacture and sale of arms had ceased and the manufacture of arms were entirely in the hands of the government, would you not say the government would have turned traders?

Captain Llewellyn: They might have.

4099. *Chairman*: Then all these troubles to which you have referred here would have occurred just the same, only the arms would have come from governments instead of through private people?

Captain Llewellyn: That is assuming that the owners of armament stocks were actuated by motives which were somewhat questionable, either political motives for helping a potential ally or for the sake of profit. My personal idea was that in dealing with the question of arms I had in view international agreement on the subject. I can quite see that without international agreement our failing to sell or manufacture merely deprives us of a very lucrative form of export.

4100. *Chairman*: Then you say: "Monopoly—this is a decided disadvantage of private manufacture. At present the state must not only buy all its raw material from the interested trades but also the bulk of its finished material." Supposing you abolish the sale of munitions manufactured by private firms, there is still the difficulty, is there not, about buying the raw material from interested trades? Assuming the state manufactures itself, you can only get over that difficulty by complete nationalisation, can you not?

Captain Llewellyn: Complete nationalisation of everything in the country. Take one article of which a great many people may not be aware—silk is an absolute essential to the firing of a gun because the cordite or propellant must be silk bagged. If you bag it in cotton you get an explosion. So the silk industry comes in there. To take it further, the tanning industry comes in. We must have leather; iron ore, coal. Unless you draw a line at a semi-manufactured or a semi-finished stage, I submit it is quite impossible to distinguish what constitutes armaments and what does not. A perusal of the contraband list at the end of the late war reveals something like 3,000 items which were considered warlike material.

4101. *Chairman*: Then you say: "It is undesirable to allow private manufacturers to make profit on information obtained free from government sources." Then you refer in the same paragraph to the question of government officers going into the employment of private firms. Assuming that there is to be no monopoly and that the government are to work in co-operation with private firms to the best advantage of everybody, then it is only natural, is it not, that the government will say to the private firm, "You make the gun. I am in possession of the range to test it and I will test it on my range." Is

there any objection to that if that is to be the system under which armaments are to be effective?

Captain Llewellyn: It seems to me that then you have reached a stage of government control of such an intense character that it almost amounts to nationalisation.

4102. *Chairman*: Is that a bad thing, what you call "almost nationalisation," "Next door to nationalisation"?

Captain Llewellyn: If it is going to restrict the possibilities of indiscriminate sale, then it is a step in the right direction.

4103. *Chairman*: I am troubled about the question of these people, the ex-officers to whose employment you see so much objection. I can see the objection as long as they are competing firms, because an ex-officer may go into a private firm and he may have friends in the office, and he may then go and use some influence to get a particular order for his firm, but assuming the government and the private manufacturers are working in co-operation there is no question of that, because there is no competition. What is the real disadvantage, in your mind, of a man going straight from the service to a private firm?

Captain Llewellyn: I think the advantage lies with the state. I think the state has the advantage if it staffs or partially staffs the firms who are going to supply its armament stores because it ensures that those firms have with them men who understand the use of the article, and without an understanding of the use of the article the manufacture is not likely to be so successful. But I think one has to bear in mind the fact that competition might arise. New armament firms grow up. It is not so many years ago that the one and only private manufacturer of guns was Armstrong Whitworth. It is within the last 40 years, I think, that Vickers came into the gun or armament trade. Then shortly before the war, in 1907, a new concern grew up—the Coventry Ordnance Works.

4104. *Chairman*: I quite agree conditions may alter.

Captain Llewellyn: Conditions may alter at short notice.

4105. *Chairman*: But assume conditions to remain as they are, I understand the first part of your answer is that you think it is rather an advantage.

Captain Llewellyn: I think it is a disadvantage that the conditions shall be so stabilised that there is no competition and that the state is really leasing or letting out the work to a private individual.

4106. *Dame Rachel Crowley*: I was rather interested in one sentence in the paragraph headed "Private manufacture: Disadvantages." "The evidence seems to clearly show that state manufacture will act against war risks, provided that it is the state only that sells and that sale from government to government be only through a committee of the League of Nations. Isolated action by one or two nations will only result in building up foreign production facilities and foreign profits." Do I understand from that that you are not in favour of state manufacture unless there can be international agreement?

Captain Llewellyn: That is roughly my view. I say that it is futile to attempt to restrict in this country if other countries are merely going to take what would have been our export trade.

4107. *Dame Rachel Crowley*: You cannot conceive of any international convention or agreement which would leave to governments the liberty of private manufacture or government monopoly?

Captain Llewellyn: I can conceive agreements, but I cannot from recent experience see much prospect of their being observed.

4108. *Dame Rachel Crowley*: You cannot conceive an effective international agreement which would leave it to the nation to decide whether they would have private manufacture or government monopoly in their own country?

Captain Llewellyn: It would be a pious hope in the present condition of affairs, no more.

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

4100. *Dame Rachel Crowley*: You feel we ought not to deprive private manufacturers of the opportunity of export unless we can get international agreement?

Captain Llewellyn: Unless it is international.

4110. *Dame Rachel Crowley*: This is rather going back to what you and the Chairman have been discussing—the passage in which you say: “If in the hands of a number of manufacturers not working in rings or arrangements or combines, then it ensures fair competition and lessening of costs with the maintenance of quality.” I read that as implying to a certain extent that fair competition is not possible, and the lessening of cost is not possible, because you feel sure that manufacturers are all working in rings or combines. Is that a fair interpretation of that paragraph?

Captain Llewellyn: Yes. Take, for example, heavy guns. There are only two firms capable of producing heavy guns in this country, and the possible production of one firm is perhaps one-quarter to one-fifth that of the other firm; so that if the government go into the market and want to buy 40 15-inch guns, whatever the price offered they know that the output of one firm cannot be more than (we will say) six guns in the next 18 months, so that the balance of the order must necessarily go to the other firm.

4111. *Sir Kenneth Lee*: You say that Woolwich Arsenal can and does produce at costs below the trade, that is, when conditions are brought to a like basis. What evidence have you of that?

Captain Llewellyn: A recollection of the costed prices which were invariably submitted by the Arsenal at the time the tenders were placed with the various contracting firms in existence when I was the chief inspector. Those prices were invariably passed through me for a certificate that the quality of the article was likely to be, and the rates of delivery were likely to be, up to the Admiralty specification.

4112. *Sir Kenneth Lee*: What date are you talking about?

Captain Llewellyn: It is eight years since I left the Admiralty.

4113. *Sir Kenneth Lee*: Does that hold to-day?

Captain Llewellyn: I should say, knowing what was in progress at the time, that the costs of manufacture have probably been reduced considerably, as there was considerable re-organisation going on during the whole of the period from 1919 to 1928.

4114. *Sir Kenneth Lee*: May not the private manufacturers now be capable of producing cheaper than the Arsenal?

Captain Llewellyn: Take, for example, cordite.

4115. *Sir Kenneth Lee*: I am not asking about cordite.

Captain Llewellyn: We will take another example—gauges. Up to 1924 we bought our gauges, or had them made to a limited extent in Woolwich Arsenal; and owing to the difficulties of obtaining supplies and deliveries and the high cost, I was able to induce the Admiralty to spend something like £40,000 on building and equipping a gauge factory at Sheffield. I was able to produce gauges at approximately half the price I could buy them at, with everything costed and every charge brought in.

4116. *Sir Kenneth Lee*: Yes, but that is nothing to do with Woolwich, is it?

Captain Llewellyn: It was to relieve Woolwich, or to relieve the extension of the gauge making facilities at Woolwich, which at that time were not sufficient for meeting more than a very small part of the requirements. I am not in a position, speaking from memory, to give the actual figures of cost for fuses and guns; but they can be ascertained, and it was a definite rule that the Arsenal should not receive orders unless their prices and conditions of delivery were at least as favourable as those of the contractor, and I think that policy has remained.

4117. *Sir Kenneth Lee*: We have had rather different evidence about the conditions, but you have no specific evidence that Woolwich does produce cheaper?

Captain Llewellyn: Speaking from memory only—it would have been improper of me to have made a record of the prices and to have retained them for my own use after—

4118. *Sir Kenneth Lee*: But you make a specific statement there?

Captain Llewellyn: Which can be verified if the official figures are produced.

4119. *Sir Kenneth Lee*: You are speaking of about eight years ago?

Captain Llewellyn: Yes, but I have no doubt the official figures are still available.

4120. *Mr. Spender*: I am not quite sure from what you have told us what exactly you are in favour of at the present time. Are you, with or without international agreement, in favour of our going on to a state monopoly?

Captain Llewellyn: Not to a state monopoly. I think a state unit capable of controlling any monopoly of the trade; that is, of being able to say: “Very well, if you will not make at our price we will”; in other words, to be able to regulate the price by always having a competitor in the form of the state.

4121. *Mr. Spender*: That is practically what Sir Eric Geddes recommended to us; he recommended a state establishment or laboratory which would specially charge itself with gauges, machine tools, and specifications. You would go further than that?

Captain Llewellyn: Yes.

4122. *Mr. Spender*: You would enlarge, say, Woolwich or the dockyards?

Captain Llewellyn: I am not in a position to speak of the dockyards. I have had very little to do with them of recent years.

4123. *Mr. Spender*: But the same principle would apply?

Captain Llewellyn: Yes, the same principle applies there; and so far as Woolwich Arsenal is concerned, they could turn out heavy guns provided they buy the material, and fuses and cartridge cases.

4124. *Mr. Spender*: They would have to be in a position to say to a private firm: “Your price is too high,” and under your scheme the Arsenal would have to be enlarged and have sufficient reserves of labour, and so forth, to be able to execute the order themselves?

Captain Llewellyn: That is my view.

4125. *Mr. Spender*: Then with regard to the employment of ex-officers, and so forth. Supposing it to be, as it obviously is, to the advantage of the government that there should be close touch between them and the manufacturers—that there should be a liaison—would not it be more satisfactory that the government itself should nominate its nominees on the boards of these companies?

Captain Llewellyn: That is the course I should prefer myself. I certainly think it is more desirable.

4126. *Sir Philip Gibbs*: You mentioned the cheapness of the cordite which is made at Holton Heath. Would that cheapness be due to the elimination of private profit or to some new system of manufacture?

Captain Llewellyn: It is due to the system of manufacture which has been brought to the cheapest possible figure through intensive organisation, and, of course, there is no profit.

4127. *Sir Philip Gibbs*: Would the question of profit make a considerable difference?

Captain Llewellyn: If you take the present price as being half the previous price it allows a very big margin for profit.

4128. *Sir Philip Gibbs*: I was wondering, for instance, whether the I.C.I., which, after all, is a

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

highly organised business, could also make ordite at a similar price if they used the same methods.

Captain Llewellyn: I should think probably not; and, if I may say so, another point is that it would be very undesirable to give away the details of our manufacture to anyone.

4129. *Sir Philip Gibbs:* I was coming on to that point of secrecy. From one or two things you said in your preliminary statement it rather seemed to me that the private firms make use of government designs, and they manufacture, perhaps, a multiple series of such designs in the way of guns, and so forth, and sell them to foreign countries?

Captain Llewellyn: Yes.

4130. *Sir Philip Gibbs:* And that, therefore, the present system of private manufacture does not ensure secrecy of government designs. Do you go as far as that?

Captain Llewellyn: Whether secrecy could be observed in any event I am not in a position to say. But as it stands at present, we will take designs, they are primarily the outcome of the views of the people who use the weapons. They say: this weapon wants this, that, or the other done to it to bring it up to our requirements. Those ideas are embodied in a draft design and are sent to the manufacturers for their remarks and suggestions; but without those draft or sketch designs, without a statement of the functions that the article has to perform, the man who has no knowledge of the use of the weapon could not possibly suggest the improvements, and those designs are worked up and eventually brought into manufacture, and later if a foreign government requires a gun I think it is natural it is offered something which is fairly up to date. It might not get exactly the latest weapon, but if it is only two or three years behind there will still be ships in our service which carry weapons which are of an earlier pattern still.

4131. *Sir Philip Gibbs:* Then, following on from that question, would you think that there is a continuous development in design and in the efficiency of the design coming from the private manufacturer? Judging from your previous answer I should say no?

Captain Llewellyn: No; I think the state can take the credit of being the prime mover in all improvements in design and the use of armament stores.

4132. *Sir Philip Gibbs:* That is contrary to a great deal of the evidence we have heard from witnesses who are in favour of private manufacture, and they all lay very great stress on the continued improvement of design arising from private manufacture. You do not agree with that?

Captain Llewellyn: I do not agree. I cannot call to mind any definite radical improvement which is traceable to original ideas of private concerns.

4133. *Sir Philip Gibbs:* So that I imagine our Royal arsenals and dockyards and government laboratories are really the controlling brain in design?

Captain Llewellyn: That is my view. Our research departments at Woolwich, and our design departments at Woolwich for dealing with armament stores, are the prime movers in initiating improvements, and are certainly the deciding factor when it comes to deciding whether any device which is submitted for adoption is suitable or is workable. There are a number of inventions which come in which are not workable, and a number of drawings are sent in which, if the article was produced, could not be used. All those things have to be modified by the designing staffs of the Admiralty and the War Office.

4134. *Sir Philip Gibbs:* That is very interesting, but it is extraordinarily different from a great deal of evidence we have heard, especially from what one might call technical witnesses, who all seem to defend private manufacture from one aspect, and that is the efficiency of design.

Do you think in fulfilling contracts private firms are apt to use slack work or cheap material in order to fulfil a contract, speaking generally—I do not want specific instances?

Captain Llewellyn: Generally I should say that the standard of workmanship as turned out from a machine is approximately the same, because the workmen, whether they are employed in the arsenal or elsewhere, are trained in much the same methods of work and the machines are much the same; but there is a tendency where a man is involved in profit or loss to try and get the inspector to take something which is not quite as good as it might be. I have in my mind cases where private manufacturers have deliberately rejected material because they have known it to be likely to be unsafe; I have had other cases where they have deliberately tried to get past my inspection, material which was obviously unsuitable; but I have never in my experience found a responsible person in a state factory asking me for the acceptance of something which obviously was not suitable.

Sir Philip Gibbs: That seems to me to be a very strong criticism of private manufacture.

4135. *Chairman:* You do not say that is general, do you, in private manufacture? Private manufacturers as a rule do not seek to pass off bad stuff?

Captain Llewellyn: I could produce a good many examples of instances where material has been put forward which should not have been, and the distribution of such efforts has been fairly wide.

4136. *Professor Gutteridge:* You do not suggest it is the rule though?

Captain Llewellyn: It is by no means the rule.

4137. *Chairman:* Inspectors make mistakes like other people, do they not?

Captain Llewellyn: They are not infallible.

4138. *Chairman:* I agree. You must not put it all down to the private manufacturer because he and the inspector do not always agree?

Captain Llewellyn: It is not a question so much of agreement, but there are certain instances of fact.

4139. *Chairman:* I only want to stick up for the general run of manufacturers. I do not believe the general run of manufacturers try to pass off bad stuff.

Captain Llewellyn: I do not think they do.

4140. *Chairman:* That is not the reputation of manufacturers in this country.

Captain Llewellyn: I do not wish to convey the impression that they do.

Chairman: We are agreed.

4141. *Sir Philip Gibbs:* Do you think a good many of the dud shells in the War were due to the imperfect quality of the material, or to carelessness of workmanship?

Captain Llewellyn: A combination of the two—ignorance very largely.

4142. *Sir Philip Gibbs:* But not due to the corrupt fulfilment of contracts by poor material?

Captain Llewellyn: I have one very glaring example in my mind, to which I think I had better not refer, of deliberate faking on a large scale; but, generally speaking, the faults were those of ignorance, and those faults were not detected largely because the supply of skilled examining and inspecting staffs was extremely limited.

4143. *Sir Thomas Allen:* Do you think those faults would be eliminated if there was a national factory?

Captain Llewellyn: I think so, due to the fact that in a national factory you would be working with men accustomed to that class of work. Perhaps I may give a very easily understood example of high explosive shells for 18-pounders. They were made by a firm of steel makers—that is, the bars before they were turned into shells. Those makers had a very high reputation, but a large number of the failures were traceable eventually to the fact that the leading hand in charge of a certain operation wanted to get on with the work quickly and

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

he turned the hose on to the hot steel, with the result that he hardened them and made them brittle. It was an operation which was done with the very best of intentions, but it had very undesirable results. That, I think, would not have occurred in a state factory where the men operating those various processes would have known that such a thing was not only not allowed, but involved danger.

4144. *Sir Thomas Allen*: But I do want to distinguish between a fault due to lack of skill and craftsmanship and a fault being intentional.

Captain Llewellyn: It would not be his intention—not by any means.

4145. *Sir Philip Gibbs*: I did not quite understand one of your answers to the Chairman in which he talked about the necessity of perhaps nationalising the elementary origins of weapons as well as the finished weapon itself. Might I ask you whether, in your own view, you think it is easy to draw a line between the raw materials of the weapon and the finished article?

Captain Llewellyn: It is not easy, but it is not by any means very difficult.

4146. *Sir Philip Gibbs*: You think it would be possible—?

Captain Llewellyn: —to draw a line. There are certain operations without which a potential weapon is quite useless. The operation of rifling the inner tube turns it from a pop gun into a dangerous long-range high velocity gun, and it is a very simple operation to define.

4147. *Sir Philip Gibbs*: When, for instance, you talked about the need of silk for explosives, do you see any difficulty in your own mind in the government controlling the production of explosives, but not controlling silk?

Captain Llewellyn: The production of that particular form of silk cloth should be a very easy matter.

4148. *Professor Gutteridge*: Is that what is called shalloon?

Captain Llewellyn: Yes.

4149. *Professor Gutteridge*: Is not that made separately from other kinds of silk?

Captain Llewellyn: The original raw material is silk.

4150. *Sir Philip Gibbs*: You take the line—in fact you definitely say—that private manufacture failed at the beginning of the War. Do you think if there had been state factories exclusively in this country we could have expanded more rapidly than we did under that system?

Captain Llewellyn: I think we should have expanded more rapidly, but we should also have failed almost to the same extent because the demand was not foreseen. The Admiralty requirements, I may say, were to a certain extent foreseen, and the orders placed by the Admiralty on the morning of the 5th August were sufficient, so far as Armstrong-Whitworths were concerned, to fill their works for nine months to the total exclusion of any army orders which came in later. The Admiralty were rather wide awake in that respect; they had their orders ready on the morning of the 5th August; I handed them to the chairman of the company and they were immediately put in hand. The subsequent failure to give deliveries was not the fault of the private firms. They made every possible effort, and I think that needs to be borne in mind. They made a very great effort and did everything possible to give the production, but they were loaded with orders poured in upon them from every source for every sort of weapon, and a multitude of patterns which no one had seen or tried out, and it became impossible for them to decide on their own account what was to be given preference. It was the lack of co-ordination between the services in regard to supplies and the rate of delivery which helped the confusion and what is termed the failure of private enterprise, but it was not failure due to inefficiency, and it was not failure due to neglect or lack of skill.

4151. *Sir Philip Gibbs*: Do you think we have avoided those difficulties in future by the lessons of the late war? Do you think the services now are fully aware of that, and that there is a system working now which would obviate that long drag and delay?

Captain Llewellyn: I still think the system could be improved upon if the state were a larger producer of armament stores itself.

4152. *Sir Philip Gibbs*: I want to ask you rather a general question, and it is this: Supposing it is impossible to establish a state monopoly of armaments, can you see any half-way house; can you see, for instance, a ministry of supply controlling the production of arms in this country. Have you thought that out?

Captain Llewellyn: Yes, I have thought about it very carefully. I am afraid a ministry of supply involves such tremendous figures that it is impossible for an individual, or even a collection of individuals, to do the allocation, which was the trouble in the late war, so as to please the various fighting services; they are all clamouring for their own particular requirements, and how is any one individual to decide what is the urgency of this particular article, and so on? It seems almost impossible to imagine that such a person could be found, and it must eventually come to an individual. I think the present system of each service more or less controlling its own requirements subject to common purchase is a very good working one.

4153. *Sir Philip Gibbs*: Are they under the control at all of the Committee of Imperial Defence at the moment—do you know?

Captain Llewellyn: That I cannot say at the present time—previously, not.

4154. *Sir Philip Gibbs*: Because there have been various suggestions put before us by important people of shadow ministries and ministries of supply, and boards of armaments, all of which have for their object first of all the total control by the government over the possibilities of expansion and manufacture, and especially, as a matter of fact, the rapidity of expansion in time of war. You have not thought that out yourself?

Captain Llewellyn: A sub-committee of the Committee of Imperial Defence deals with that particular aspect of production, and it sits continuously dealing with the figures which are returned from time to time of actual and possible production and making up the statement of potential resources from day to day, so to speak; but it merely deals with the possible sources of supply and the quantities; it does not deal with the allocation, and, after all, the allocation must depend on the changing circumstances from day to day in any particular time of war.

4155. *Sir Philip Gibbs*: Might I go back to the last paragraph of your statement, especially the historical aspect, the effect of private export in creating wars in the past. With regard to the South African war, do you happen to know who armed the Boers?—

Captain Llewellyn: I believe it was almost entirely Krupps and Creusot—German and French.

4156. *Sir Philip Gibbs*: It was not done within your knowledge by the governments; it was actually the private enterprise of Krupps and Creusot?

Captain Llewellyn: Creusot would be private enterprise.

4157. *Sir Philip Gibbs*: With regard to the Balkan wars, do you think, first of all, the wars of 1912 between Serbia and Bulgaria against Turkey, and then afterwards Serbia and Bulgaria against each other were made possible by the private sale of arms?

Captain Llewellyn: Of course with those small nationalities their industry is war, or has been; and it is very difficult to say they would not have fought in some way or another, even if they had been refused merely rifles and bayonets; but there comes

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

a time when, if they cannot get any of the modern weapons, their war becomes a matter of by no means such great importance, even if there is a war.

4158. *Sir Philip Gibbs*: It is rather accepted now historically that the Balkan wars were the sort of prolude to the Great War, and therefore what you have said has struck me very much, because it seems to me to be a very strong argument, and you still maintain that view, do you?

Captain Llewellyn: Reading the historical accounts of those wars and the lead-up to the condition of affairs in Serbia, which was very largely in a state of ferment following on the Balkan wars, it seems logical to assume that they were somewhat the cause—I will not say the War was caused by them—

4159. *Sir Philip Gibbs*: A contributory cause?

Captain Llewellyn: It contributed to the other causes of war.

4160. *Sir Thomas Allen*: On the question of relative costs, have you any system of costings at Woolwich which would enable you to compare like with like with private manufacture?

Captain Llewellyn: I believe the figures are arrived at on a strictly comparable basis, allowing for the fact that some parts of Woolwich Arsenal are retained as a store house, others for repair work, and others on an emergency basis for possible production, and bringing down the figures to what was accepted as a comparable basis. What the percentages were I am not in a position to say.

4161. *Sir Thomas Allen*: You lay great stress upon the importance of secrecy. Is it not true to say that any invention of a private manufacturer may be made secret by a government purchase?

Captain Llewellyn: If it is a process which is readily describable, but there are certain secrets which are very difficult even to commit to paper.

4162. *Sir Thomas Allen*: I understand also that the national factory is open (say) to another government, that it may send its experts and have a good look round. Is there any possibility of keeping secrets under a system of that character?

Captain Llewellyn: There are certain secrets which have been kept from me at various times through not being able to see certain processes. It does not require a drawing or even very definite dimensions in certain processes of shell hardening to enable you to arrive at the true secret which gives the success. Most of those processes which are worked out in the manufacture of a modern shell are arrived at by trial and error, and a great deal of it is merely in the heads of a few individuals, and I doubt very much whether it would be possible to commit certain information to paper.

4163. *Sir Thomas Allen*: We have been told here from time to time that Woolwich has been backward for very many reasons and it could not hope to compete with private firms.

Captain Llewellyn: That is so.

4164. *Sir Thomas Allen*: Could you give us any reasons why that is so?

Captain Llewellyn: I think the financial reason is primarily at the bottom of it. The cost of equipping Woolwich Arsenal to make the modern types of armour-piercing shell would be very very high, and if the article could be bought satisfactorily elsewhere and money is short I suppose the considerations of money have over-ruled any other considerations.

4165. *Sir Thomas Allen*: Have you been handicapped at all by the pressure of private firms to have work given to them, and consequently Woolwich being kept relatively idle?

Captain Llewellyn: So far as these particular shells to which I have been referring are concerned, Woolwich has not been able to make them, and the fact that it has not been given the facilities has put the manufacturer in the position of being able to say: "Well, we have the monopoly," which they have. Had the money been spent in keeping the state factory as efficient in that particular

department as the private manufacturers there would not have been the monopoly which at present exists.

4166. *Sir Thomas Allen*: What really do you mean by efficiency?

Captain Llewellyn: New plant, modern plant, on ideas which have been developed and fundamentally changed in the last 15 years.

4167. *Sir Thomas Allen*: Would you say that private enterprise is more advanced in that particular direction at the present time?

Captain Llewellyn: Most decidedly.

4168. *Professor Gutteridge*: One question about the Holton Heath cordite factory. You say that the price per pound at which a propellant is now being made would astonish trade producers. What method of comparison have you adopted?

Captain Llewellyn: The price paid by the Admiralty and price cost to the Admiralty.

4169. *Professor Gutteridge*: I thought you told us the Admiralty did not buy cordite?

Captain Llewellyn: They used to buy it; they do not now.

4170. *Professor Gutteridge*: How long ago is it since they bought it?

Captain Llewellyn: I should think the last big purchase would be in 1918.

4171. *Professor Gutteridge*: So you are taking 1918 as the year for the trade price?

Captain Llewellyn: No, I should take the average price on a pre-war basis.

4172. *Professor Gutteridge*: Over the pre-war years?

Captain Llewellyn: Yes.

4173. *Professor Gutteridge*: What figure are you comparing with that—the price at the present day?

Captain Llewellyn: Yes.

4174. *Professor Gutteridge*: Is it not possible that there may have been marked improvements in private methods of manufacture?

Captain Llewellyn: It is possible, but I cannot imagine—

4175. *Professor Gutteridge*: I only wanted to know what your comparison was.

Captain Llewellyn: My comparison is what we used to pay before the War and the price to which it has now been reduced. It is now so low as to be a surprise to all of us who were in any way interested in that process of manufacture.

4176. *Professor Gutteridge*: Are you quite sure that I.C.I. do make cordite?—I am under the impression that they do not.

Captain Llewellyn: They used to make it.

4177. *Professor Gutteridge*: At the present time I mean.

Captain Llewellyn: I do not think at the present time there is any demand.

4178. *Professor Gutteridge*: My recollection of the evidence given by I.C.I. was that although they used cordite for filling small arms ammunition they got the cordite elsewhere; if it was a government order they got it from the government, and so on.

Captain Llewellyn: Cordite stored under certain conditions lasts for a great many years, and the annual consumption of cordite by the land forces is very small.

4179. *Professor Gutteridge*: Mr. Haldane had a walking stick made of it, did he not?

Captain Llewellyn: You could. The peace time consumption of cordite is negligible for the land services. The Admiralty consumption of cordite is very much higher because so many heavy guns are fired. There is a certain turn over of cordite—I cannot say whether it is being done now, but we were supplying surplus naval cordite for army purposes. It is quite possible that that is being done still, in which event there would be no necessity to purchase over a long period of years from the trade.

4180. *Professor Gutteridge*: I am not quite sure whether I understood you correctly or not, but I rather gathered you said improvements in design do

6 May, 1936.]

Captain L. E. H. LLEWELLYN, C.B., O.B.E., R.N. (Retired).

[Continued.]

not come from private firms. You made rather a general statement?

Captain Llewellyn: Generally speaking, I adhere to that, that the main improvements, the fundamental improvements, new weapons and new ideas do not come from outside.

4181. *Professor Gutteridge:* What about the Bren machine gun?

Captain Llewellyn: I do not know it.

4182. *Professor Gutteridge:* That is a new machine gun, the invention of a private firm.

Captain Llewellyn: That is since my time, but the heavy modern gun is certainly not the production of the trade.

4183. *Professor Gutteridge:* I am not saying everything is, but there are things like the Lewis gun, for instance, and the Stokes gun. They were not designed in the government factories?

Captain Llewellyn: I do not know that they were designed by armament firms; I think they were rather designed by private individuals.

4184. *Professor Gutteridge:* That is what I mean; but they were not designed in the government factories.

Captain Llewellyn: Those same resources of tapping intelligence would be available whether the state was the manufacturer, or whether it was not.

4185. *Professor Gutteridge:* I quite agree. I only wanted to know how far you were going when you said that practically all improvements in design now came from the state factories. That is what I was rather challenging.

Captain Llewellyn: I would not put it so generally as that. I say generally speaking development depends on the state.

4186. *Professor Gutteridge:* Do not you think you are rather hard on the small states. Do you think it would have been better if Venice had remained under the Austrians and the Greeks had still remained under the Turks?

Captain Llewellyn: I think, perhaps, we should have been happier.

Professor Gutteridge: If that is your attitude I have no more to say.

Chairman: That is all, thank you. We are much obliged to you for coming.

(Adjourned.)

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

NINETEENTH DAY

Thursday, 7th May, 1936

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., LL.D., R.R.C.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

The Honourable Esmond HARMSWORTH and Sir THOMAS McARA, representing the Newspaper Proprietors' Association, Limited, called and examined.

4187. *Chairman*: Gentlemen, as you know, of course, in the Report of the First Committee on the Private Manufacture of Arms (Temporary Mixed Commission) amongst other things they refer in general to the objections that are raised to untrammelled private manufacture and amongst other objections they include this, that armament firms have sought to influence public opinion through the control of newspapers in their own and foreign countries. I understand that your object and desire in coming here is to give us information with regard to the position of the Press in this country. I understand that you two gentlemen represent *The Times*, *Daily Telegraph*, *Morning Post*, *Daily Mail*, *News Chronicle*, *Daily Express*, *Daily Herald*, *Daily Mirror*, *Daily Sketch*, *Financial News*, *Financial Times*, *Morning Advertiser*, *Sporting Life*, *Sportsman*, *Evening Standard*, *The Star*, *Evening News*, *News of the World*, *The Observer*, *Sunday Times*, *Sunday Dispatch*, *Sunday Express*, *Reynolds's*, *The People*, *Sunday Graphic* and *Sunday News*, *Sunday Pictorial*, *Sunday Referee*, *Sunday Sportsman*. And there may be others.

Sir Thomas McARA: That is the complete list.

4188. *Chairman*: You have prepared a statement,* which we have before us, but I understand, Mr. Harmsworth, you desire to make a short statement.

Mr. Harmsworth: I thought perhaps I would make a statement which might do away with some of the questions, if you would prefer that.

4189. *Chairman*: Yes, we should prefer to hear your statement.

Mr. Harmsworth: Am I right in imagining that the information that you require is whether newspapers can be influenced in any way by armament firms?

4190. *Chairman*: Whether they are or can be.

Mr. Harmsworth: Whether they are or can be.

4191. *Chairman*: In this country.

Mr. Harmsworth: In this country. I cannot speak, of course, for any newspapers outside.

4192. *Chairman*: No.

Mr. Harmsworth: Well, Sir, this is the statement I have prepared. May I read it?

4193. *Chairman*: Yes.

Mr. Harmsworth read the following statement: I have been asked to come here to-day to give evidence on behalf of the national newspapers, in

order, I presume, to clear up any misconception there may be as to our attitude towards armaments firms, or any conceivable kind of profit which might accrue to newspapers either through large sums being spent on armaments or in the event of war itself breaking out.

None of the members of the Newspaper Proprietors' Association are connected, either directly, or indirectly, with any armament firm.

None of the directors of any of the companies who are members of our association are either directors or personally interested in any armament firm or firms.

None of the majority shareholders of the said companies are personally interested in any armament firm or firms.

Advertising carried by the national newspapers paid for by armament firms is negligible.

There never has been—there is not—and there never will be—any pressure of any kind which armament firms could possibly bring to bear, either directly, or indirectly, on national newspapers which could influence their policy in any way.

No industry in the country is probably more adversely affected by an outbreak of war than the newspapers.

Although in war it may happen that the demand for newspapers is increased, it is unnecessary for me to inform you that the profits of newspapers do not arise from their sales but from their advertising revenue. This advertising revenue would immediately be affected adversely.

During the late war, besides the shrinkage in revenue caused by the falling off of advertisements, the newspaper industry had to cope with a tremendous increase in the cost of raw materials.

I find that the average price of stereotype metal, pre-War, was £32 10s. At the end of 1918 it was £56.

The average price of linotype metal, pre-War, was £23 10s. At the end of 1918 it was £45.

The standard price of news print in 1914 was 1d. per pound, equivalent to £9 6s. 8d. per ton. During the war period this rose to 4½d. per pound, equivalent to £45 10s. per ton.

Mechanical pulp rose from 42s. in 1914 to 110s. per ton in 1917. In 1918 the pulp had to be taken dry, owing to the restriction on freights, which made the price about £26 per ton f.o.b.

Sulphite pulp was bought in 1914 for £7 5s. In 1918 it was £44 per ton; and in the latter stages of the War it was not unknown for mills having purchased their pulp f.o.b. to have paid £12-£15—and

* Appendix I, p. 568.

7 May, 1936.]

The Hon. ESMOND HARMSWORTH and Sir THOMAS McARA.

[Continued.]

even £20 per ton to get the pulp over. In 1918, therefore, the average cost of sulphite would not have been far short of £60 per ton as against £7 5s. pre-War.

Mechanical pulp must have been costing somewhere about £35 per ton as against 42s. per ton pre-War.

These figures will give an indication of the enormous difficulties confronting newspaper enterprise in time of war.

From the motive of purely self-interest, newspapers would be entitled to oppose any political policy tending towards war.

On the question of whether armaments should be manufactured by private enterprise or by the government, as I represent here to-day newspapers of every shade of political thought, it would not be proper for me to give an opinion.

4194. *Chairman*: Of course one knows that newspapers do take a strong line upon which there is difference of opinion in reference to armaments and so forth, but you come here to tell us that those opinions are perfectly genuine and unbiased opinions and in no way influenced by any armament firm?

Mr. Harmsworth: Yes.

4195. *Chairman*: That is the only question I wish to ask.

Dame Rachel Crowley: I have no questions either, Mr. Chairman. I feel as you do, that it would not be the influence of armament firms that would affect the opinions of the newspapers but much more their political bias, with which we are not concerned to-day.

4196. *Mr. Spender*: Your Association represents only the London newspapers?

Mr. Harmsworth: Only the national newspapers.

4197. *Mr. Spender*: As regards the provincial newspapers, you do not speak for them but one might say that practically all that you have said would apply to them also?

Mr. Harmsworth: I should say it would certainly apply.

4198. *Sir Philip Gibbs*: I accept everything that you say, Mr. Harmsworth. I have one query in my mind on the general argument of the great increase during war in the cost of the material used by the newspapers. I should like to ask, how do you reconcile that with the fact that certain newspapers in other countries, which need not be specified, do

seem to incite their nations to warlike courses, in spite of the fact that they also would find the cost of their material enormously increased during war time.

Mr. Harmsworth: I should not like to make a reflection on any foreign newspaper, but, of course, in answer to that question, some foreign newspapers are not as advantageously placed as the English newspapers. By that I mean that the advertising revenue in a country like England is very, very great and our newspapers are therefore correspondingly prosperous. I should say that of America, too. But, of course, there are places in Europe where the advertising revenue is bad and newspapers are poor, and perhaps in those cases the temptation is great.

4199. *Professor Gutteridge*: Is it not a fact also that in some countries there are too many newspapers in proportion to the population?

Mr. Harmsworth: Yes; in some countries abroad newspapers are started and run purely for political reasons and not as an industry. I think in this country we can say it is entirely an industry. Although they represent different shades of opinion, certainly there is no national newspaper which is run purely for the political opinions of its proprietors and not also with a view to its being an industrial undertaking.

4200. *Sir Thomas Allen*: As there is practically only one purchaser of armaments in this country, have you any revenue at all from the advertising of armaments?

Mr. Harmsworth: It is always difficult to make a reply to a question like that. Take the case of the Rolls-Royce Company, which I believe manufactures engines for aeroplanes in addition to manufacturing motor cars; of course its motor car advertisements appear in the newspapers, but not the advertisements of its manufacture of aeroplane engines. They are made merely for the government, and—luckily for the company—they do not have to advertise their aeroplane engines.

4201. *Professor Gutteridge*: Even in the trade supplements you do not get advertisements of armaments as such, do you?

Mr. Harmsworth: No.

Chairman: Thank you. We are very much obliged to you for your statement, and, of course, your written communication will form part of our proceedings.

(The witnesses withdrew.)

Mr. R. C. SKRINE STEVENSON (Assistant Adviser on League of Nations Affairs, Foreign Office), called and examined.

4202. *Chairman*: I understand you come here representing the Foreign Office. You submit two papers?

Mr. Skrine Stevenson: That is right, Sir.

4203. *Chairman*: Which have been compiled as representing the views of the Foreign Office on these particular points.

Mr. Skrine Stevenson: Yes.

4204. *Chairman*: Just to make plain what the two documents are: One is a memorandum prepared by the Foreign Office summarising the work of the League of Nations in regard to paragraph (5) of Article 8 of the Covenant.* That is merely historical, is it not?

Mr. Skrine Stevenson: Purely historical.

4205. *Chairman*: And merely giving us information as to what in fact has happened?

Mr. Skrine Stevenson: Yes.

4206. *Chairman*: There is nothing controversial about that?

Mr. Skrine Stevenson: No, Sir. It is merely a statement of fact.

4207. *Chairman*: That will be accessible to the Press or anybody who wants it and will become part of

our proceedings. I do not think we need go into that at the moment. The other is a memorandum of evidence submitted on behalf of the Foreign Office* and in an explanatory note it states that it is a Memorandum of Evidence dealing with item (2) of the terms of reference of the Royal Commission, which runs as follows:—

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimise the kind of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

Then you explain: "This memorandum of evidence after recapitulating briefly the work of the League of Nations in regard to Article 8 (5) of the Covenant explains the attitude of His Majesty's Government in the United Kingdom, notes certain complementary conclusions they have reached and details the manner in which they consider the problem can best be dealt with."

Then follows this document which you have prepared containing Part I and Part II. Do you wish to have that read?

* Appendix II, p. 569.

* Appendix III, p. 573.

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

Mr. Skrine Stevenson: No, Sir. I think it would perhaps be a waste of the time of the Commission if that were read. I would take it as having been read.

4208. Chairman: Are there any particular points to which you wish to refer before we ask you questions?

Mr. Skrine Stevenson: No, Sir.

4209. Chairman: Under the head "Attitude of His Majesty's Government," paragraph 14, you refer to the three points in the Council Committee's questionnaire:—

(i) *The nature and extent of the "grave objections" of a national or international character, to the private manufacture of arms, etc.*

(iii) *Any possible obstacles to the conclusion of international agreements on the control of the private manufacture of arms.*

(v) *The provisions which should be inserted in any convention on the subject.*

Then you come to the replies of His Majesty's Government, which were drawn up by a sub-committee of the Committee of Imperial Defence under the Chairmanship of Lord Cecil. They replied as follows:

(i) *So far as this country is concerned the British Government are not aware of any "grave objections" of a national character.*

Did this committee take evidence or did they merely deal with the matter on the experience of the officials?

Mr. Skrine Stevenson: I imagine the latter, but I was not in England at the time and I do not know for certain.

4210. Chairman:

As regards objections of an international character the British Government do not know of any that are peculiar to private manufacture.

By that I understand they mean that this unfortunate system of giving bribes or presents prevails in respect of all kinds of trade in certain particular countries and there is nothing special with regard to private manufacture of arms.

Mr. Skrine Stevenson: I think private manufacture as distinct from state manufacture.

4211. Chairman: Private manufacture of arms.

Mr. Skrine Stevenson: Private manufacture of arms.

4212. Chairman:

In any case the Convention for the Supervision of the International Trade in Arms and Ammunition and in Implements of War, signed at Geneva on 17th June, 1925, when in force, will deal with the international aspects.

Has that ever been done?

Mr. Skrine Stevenson: Unfortunately that convention is not in force. It has been ratified by a number of countries but not by a sufficient number to bring it into force.

4213. Chairman: The next point I wanted to ask about comes under paragraph 18. The paragraph begins—

"The experience gained by His Majesty's Government during the international discussions of the last fourteen years has shown that the problems of arms manufacture and of arms trade cannot be dealt with separately."

There was a proposal, was there not, to deal with them separately?

Mr. Skrine Stevenson: Yes; and it went so far as the signature and ratification by a certain number of states of a convention for the control of the arms trade, but it was so disadvantageous from the point of view of non-producing countries and so much disliked by certain of the larger producing countries that it was never ratified and has remained a dead letter.

4214. Sir Philip Gibbs: Is that the 1925 Convention?

Mr. Skrine Stevenson: The 1925 Convention.

4215. Chairman: And that is referred to further down, where it says

"This state of affairs has convinced His Majesty's Government that equal treatment, so far as this is feasible, must be accorded by any convention to both producing and purchasing countries"

The latter are and must inevitably remain to a certain extent in a position of inferiority in regard to the former in that the amount of their purchases is naturally known in the markets where they are made. But it is the present aim of His Majesty's Government to minimise this natural disadvantage as far as possible and they are consequently in favour of a convention which will provide for control and publicity for both manufacture and trade."

Mr. Skrine Stevenson: Yes.

4216. Chairman: That is in order to put them more or less on the same footing?

Mr. Skrine Stevenson: Yes. The 1925 Convention provided for publicity for trade only and left the manufacture side in the dark.

4217. Chairman: The other point I wished to ask about is in paragraph 21. You say—

"Fourthly the history of international negotiations more particularly since the War, has clearly shown that success can only be achieved by slow degrees and by taking modest steps in the desired direction. Where only two or three powers are concerned progress may be relatively rapid but, as the number of powers involved increases, the difficulties also increase and the rate of progress becomes correspondingly slower. In the case of a convention for the control of arms manufacture and trade where the participation of all the principal manufacturing countries is essential the difficulty of securing agreement is immeasurably greater than in the case, for instance, of the Abyssinian Arms Treaty of 1930 which was concluded between only four powers, has been ratified and is now in force. The length of time the problem has been under discussion and the many checks and disappointments which have been encountered in the course of these years have convinced His Majesty's Government that to attempt too much is only to incur failure once again. In any undertaking and more especially in international negotiations it is the first step that counts, and, in the view of His Majesty's Government, it would represent an achievement of great value if all the principal manufacturing countries could agree to a convention which would entail the acceptance of the following principles:

(1) *Strict national control of arms manufacture and trade.*

(2) *Publicity for arms produced, exported or imported.*

(3) *Establishment of an international supervisory organ.*

(4) *Responsibility to that international organ for the accuracy of returns of manufacture and trade."*

That is what this government would wish to see?

Mr. Skrine Stevenson: Yes.

4218. Chairman: But that, of course, is by international agreement?

Mr. Skrine Stevenson: By international agreement.

4219. Chairman: I am not quite sure about this: Is this paragraph by way of answer? It is said that at one stage some particular arrangement would have gone through but for the objection of the English government. It was said that our government was obstructive. That was with regard to inspection on the spot?

Mr. Skrine Stevenson: Yes. It was suggested that to make sure that any convention, such as the one which we attempted to sketch out last spring, was carried out properly a system of supervision was desirable. There was a difference of opinion in

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

the Arms Committee at Geneva in regard to the degree of supervision, the method of supervision. Certain delegations were in favour of control accompanied by local inspection of armament plant, production and so forth. Other delegations, of which the United Kingdom delegation was one, were of opinion that a convention which provided purely for national control of armaments should have a particular type of supervision, if there was to be any supervision. While they would have been ready to accept a system of supervision with local inspection, in the case of a convention which limited or reduced the amount of arms which could be manufactured or held by any particular country, they did not think that for a convention which laid down no limit for the amount of arms to be produced, exported or manufactured there should be the same sort of supervision. With regard to the proposal for a system of supervision with local inspection, although that would be very difficult both to lay down and to carry out, they would be prepared to accept it if thereby they could induce other nations to reduce or to limit their armaments. If there was to be no limitation of armaments they thought a simpler system of supervision was required. In this particular case of regulation for the control of manufacture and trade there were only going to be documentary returns to the central supervisory organ and for that they considered that an adequate form of supervision would be that these returns should be examined in Geneva and that if any explanation were required by the supervisory organ they should be in a position to call upon the government of the country concerned, who would be bound to give any explanation which the central supervisory organ desired, and if the central supervisory organ then, as the result of the examination, was not satisfied that the returns which the particular country made were accurate, or if they thought that there was something which they could not get to the bottom of, they would make a report, and this report would be circulated to all members of the Council of the League and to all members of the League of Nations, and they would then be in a position to take what steps they thought necessary. H.M. Government thought that a system of that kind would not only be more suitable for a convention such as this but would be more likely to be internationally acceptable. That, perhaps, is the most important consideration of all. They were and remain convinced that if any progress is to be made the start must be modest, that if—as is hoped—any sort of convention is to be obtained it must be a simple one to start with.

4220. *Chairman*: In substance, what it comes to is this, that inspection on the spot would only be acceptable in this country provided it were accompanied by arms limitation.

Mr. Skrine Stevenson: Yes.

4221. *Chairman*: Were representatives of other countries of the same view?

Mr. Skrine Stevenson: Yes. The Italian, Polish, Japanese and other delegations.

4222. *Chairman*: There was substantial agreement amongst a number of them?

Mr. Skrine Stevenson: Four or five delegations were of that view.

4223. *Sir Thomas Allen*: Were the Japanese representatives present on this occasion?

Mr. Skrine Stevenson: By an observer.

4224. *Dame Rachel Crowdy*: Did Great Britain actually lead in that idea, or were we one of many all thinking the same thing? Did Japan, Italy, Poland, etc. follow our lead, do you remember?

Mr. Skrine Stevenson: It is always the case in Geneva committees that the big powers have to speak first. The smaller powers generally do not open their mouths until the big powers have done so.

Dame Rachel Crowdy: I do not agree with that, after 11 years in Geneva! Very often you see the big powers pulling together in order not to be the first to move. I have seen that.

4225. *Sir Philip Gibbs*: Was France in favour of local inspection?

Mr. Skrine Stevenson: Yes.

4226. *Sir Philip Gibbs*: And the United States?

Mr. Skrine Stevenson: Yes, but a slightly different system. The French wanted an even more complicated system than the United States. The United States were generally in favour of local inspection which could be confined to the storage and shipping departments of arms-producing organisations, whereas the French were in favour of a more complicated system. They wanted to appoint resident inspectors in each of the countries who would have very wide powers of examination into every stage of arms manufacture.

4227. *Sir Philip Gibbs*: They were prepared to have foreign inspectors in their own country, I imagine?

Mr. Skrine Stevenson: That was the implication.

4228. *Sir Philip Gibbs*: Was that definitely stated on their part?

Mr. Skrine Stevenson: I do not remember, to be quite frank. But they would not have put forward their scheme otherwise.

4229. *Professor Gutteridge*: Did you discuss the machinery at length?

Mr. Skrine Stevenson: Oh yes; at great length.

4230. *Sir Thomas Allen*: Did it not come as a great shock to the other nations that Great Britain was taking up this attitude?

Mr. Skrine Stevenson: I should not say it was much of a shock because, although we had said that we were in favour of local inspection and supervision of local inspection in general in connection with the disarmament concerns, we had said very clearly and on many occasions that it would have to be as part of a convention which entailed limitation.

4231. *Sir Thomas Allen*: If not a shock, a great surprise, that we had sided with Italy in this particular matter as against siding with the United States of America and France.

Mr. Skrine Stevenson: I do not think the attitude of His Majesty's Government was anything but clear, completely clear, from the beginning.

4232. *Dame Rachel Crowdy*: Perhaps rather stupidly, I am confused in my own mind as to exactly why we did object to inspection even without limitation. Will you make that clear to me?

Mr. Skrine Stevenson: I think it was because, as I said before, this convention was one which only provided for documentary returns and, in a convention such as was contemplated by His Majesty's Government, these documentary returns would cover value of manufacture, value of import or export.

4233. *Dame Rachel Crowdy*: Not detail.

Mr. Skrine Stevenson: Not number, not quantity. Where there was no question of inspecting actual quantities of arms, it seemed an unnecessary complication to have a system of local inspection.

4234. *Dame Rachel Crowdy*: Therefore, you think that the British delegation was against it because they felt it would be useless for the world and also for Great Britain.

Mr. Skrine Stevenson: I think the main reason was that we wanted to get arms limitation and one way of getting arms limitation was to say: "We will agree to complete local inspection and supervision if you will only limit your armaments," and we did not want to give that away for a mere convention controlling trade and manufacture, valuable as it would be.

4235. *Dame Rachel Crowdy*: What was the British attitude towards publicity in regard to figures of export, import and manufacture? Do you remember?

Mr. Skrine Stevenson: Yes. It is set forth in paragraph 25 of my memorandum. The original

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

United States proposals were for giving quantities. After a considerable amount of time had been spent here examining the difficulties and the *pros* and *cons* of the whole problem, it was decided that a system of publicity such as the United States suggested would be inappropriate for this convention which did not provide for limitation; first of all for the reason that it was not a matter of limitation and, therefore, any country was at liberty to manufacture any amount of arms they liked; secondly, that, in that case, what was required was that there should be publicity for the general trend of arms manufacture rather than particular information regarding the types of arms manufactured. Thirdly, we were impressed with the desirability of securing international agreement and we thought—and rightly, as it turned out—that a system which went into the detail which the United States project did, would only share the fate of previous well meaning projects, and although it might be accepted on the spot, would only be accepted *ad referendum* and would finally become a dead letter like the 1925 Convention. For those reasons, again from this particular aspect, we produced a simpler system which would give the general trend of arms manufacture, which would give advance notice of the intention of any country to increase or decrease its armaments. We thought that would adequately serve the purpose of this convention.

4236. *Dame Rachel Crowdy*: Why do you feel that your simpler proposals were not acceptable to the governments at Geneva? What was the catch they saw in them—if I may use that as an easy phrase?

Mr. Skrine Stevenson: They thought it would not give sufficiently detailed information. Although they did not deny that it would give the general trend of arms manufacture and production, they did not think it would give sufficient detail and they favoured more detail.

4237. *Dame Rachel Crowdy*: I certainly found the impression in Geneva was that the British, standing, as you say, for international co-operation, had rather scuppered international co-operation. I am quoting foreign comments made to me. There was certainly a very strong feeling that that international convention might have gone through and that there might have been very much better going if we had leaned towards the American draft instead of away from it.

Mr. Skrine Stevenson: That can only be a matter of impression. It certainly was not my view.

4238. *Dame Rachel Crowdy*: But, in fact, we got nothing, neither the American draft nor the simplified plan.

Mr. Skrine Stevenson: No. The committee has not met again.

4239. *Dame Rachel Crowdy*: There is, I understand, great feeling, both in Geneva and here, that that American draft convention,—any draft convention,—has been side-tracked and will not come back for some time. Is it indiscreet to ask you what you think, whether you think there is any possibility of its coming up again?

Mr. Skrine Stevenson: I think if any advance is made in the direction of arms limitation or control, the first step will be in the direction of control of manufacture and trade.

4240. *Dame Rachel Crowdy*: Before limitation.

Mr. Skrine Stevenson: I think so. There is more likelihood of international agreement on this subject than on arms limitation.

4241. *Professor Gutteridge*: When you say control of manufacture and trade, do you mean with inspection on the spot, or not?

Mr. Skrine Stevenson: No. I mean there is more likelihood in general of getting a convention for control of manufacture.

4242. *Professor Gutteridge*: Do you mean control with inspection on the spot?

Mr. Skrine Stevenson: No. I think not.

4243. *Professor Gutteridge*: Without inspection?

Mr. Skrine Stevenson: A simplified form of supervision. I think the important thing is the principle of responsibility to a central supervisory organ. If only that could be internationally accepted, that would be an enormous step in advance.

4244. *Dame Rachel Crowdy*: Something rather on the lines of the Opium Control Board?

Mr. Skrine Stevenson: Yes.

4245. *Dame Rachel Crowdy*: I was rather interested in your interpretation of the inset paragraph under paragraph 15, Part II. You remember the sentence that the Chairman read:

As regards objections of an international character, the British Government do not know of any that are peculiar to private manufacture. You interpret that as meaning the British Government see no particular possibility of evils not existing under a monopoly which are supposed to exist under private manufacture. Is that your interpretation?

Mr. Skrine Stevenson: Yes. The interpretation was that any evils that may exist are equally likely to exist under state manufacture.

4246. *Dame Rachel Crowdy*: Do you think that applies to such things as touting for orders? Do you believe that, under a government monopoly, government "A" would deliberately send its agents to government "B" to tout for orders, particularly if a delicate international situation were on the tapis and its representatives at Geneva were fighting internationally for a settlement?

Mr. Skrine Stevenson: It would probably not be necessary to do much touting. I think a country which depends on state manufacture is in a very much stronger position to put pressure on other countries than any armament firm or group of firms, and that if there is a question of pressure, it would be very much more effective when done by government than when done by an armament ring.

4247. *Dame Rachel Crowdy*: It would be very much less likely to happen.

Mr. Skrine Stevenson: It would depend upon what political ends the government thought would be served.

4248. *Dame Rachel Crowdy*: I am thinking of our own country, not of foreign countries.

Mr. Skrine Stevenson: That would not enter into it. We have not state manufacture to that extent that we would want to do it.

4249. *Dame Rachel Crowdy*: I mean, if we had state manufacture instead of private manufacture, do you think the same evils would exist in state manufacture as in private manufacture—for example, touting, bribery, soliciting of orders.

Chairman: On behalf of our government, do you mean?

Dame Rachel Crowdy: Yes; on behalf of our government.

Chairman: I do not think we have to conceive that.

Dame Rachel Crowdy: No. I cannot conceive it for a moment, but I thought that was the interpretation of Mr. Stevenson's paragraph.

Mr. Skrine Stevenson: This is a quotation from a report by a sub-committee of the Committee of Imperial Defence and I just gave you my own interpretation of it. I had not heard another explanation of it.

Dame Rachel Crowdy: Then I will leave that alone. That is all I want to ask.

4250. *Sir Kenneth Lee*: I am very ignorant in these matters. Can you explain to me just what "documentary return" means?

Mr. Skrine Stevenson: The convention such as the United Kingdom Government suggested provided for documentary information to be sent each quarter to the central supervisory organ which we hoped would be the Permanent Disarmament Commission;

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

it would be a matter of just filling up internationally accepted forms giving certain information which would be returned each quarter by the government of every country signatory to the convention.

4251. *Sir Kenneth Lee*: Is there any difference between a return and a documentary return?

Mr. Skrine Stevenson: There would possibly be verbal returns, but I agree it is unlikely. It is perhaps a lax phrase. What I meant to imply was that it was all a matter of paper work and not of actual inspection, of visual verification.

4252. *Dame Rachel Crowdy*: I thought inspection was what they wanted and we did not want.

Mr. Skrine Stevenson: Not His Majesty's Government. The documentary return is another matter.

4253. *Mr. Spender*: With regard to this question of state pressure and pressure being applied by private firms, is not the distinction really this, that the private firms are touting and so forth for private profit, that that would be an immaterial consideration to the state, but that the state would, and does in many cases, apply considerable pressure to persuade, or even compel, certain nations or states with which it has relations or an alliance to buy armaments from it.

Mr. Skrine Stevenson: It is not unknown.

4254. *Mr. Spender*: And you have the condition made that a loan shall be floated for the benefit of a certain country and that loan shall be expended in the purchase of armaments produced and manufactured in the country by whom the loan is made. That is so, is it not?

Mr. Skrine Stevenson: Yes.

4255. *Mr. Spender*: So you would get what is really meant, if not what is said—sometimes expressions are used which nobody can really understand—that is, another form of pressure?

Mr. Skrine Stevenson: Yes, a different kind of pressure; probably more effective.

4256. *Mr. Spender*: Could you tell us a little more about what method of publicity is favoured in these conventions? Would you publish these documents as annual reports?

Mr. Skrine Stevenson: Yes. The Permanent Disarmament Commission, if the convention had gone through, would have issued, if I remember rightly, quarterly returns showing the movement of arms and their production throughout the world. They would also have published a forecast of what was going to happen. That was part of the system which we suggested, that countries should give information in advance.

4257. *Dame Rachel Crowdy*: That is, exactly the same as for opium—export, import and manufacture?

Mr. Skrine Stevenson: Yes, except that as far as opium is concerned it is the consumption; it is what is required by each country.

4258. *Dame Rachel Crowdy*: Yes, the requirement for the following year. It is stated one year ahead.

Mr. Skrine Stevenson: This proposal of ours was to the effect that governments should state at the beginning of the financial year what they were going to spend on arms under the different headings and categories of arms which were covered by the convention. It would give more detail than we now give in the budgetary return.

4259. *Dame Rachel Crowdy*: Would the central board then have a right to comment on what it considered over-requirement for the coming year?

Mr. Skrine Stevenson: The point was made that there was no such thing as over-requirement. There was no limitation whatever. But, of course, it was open to a neighbour of any particular country to say "You seem to be going to make a lot of guns or built a lot of battleships"—or whatever it might be—"we will have to do the same. Do you not think you might cut that figure down?" That would give an opportunity for bilateral or multi-lateral conversations with a view to lessening the amount required.

4260. *Dame Rachel Crowdy*: Is there no question of the central board reporting to the Council anything that seemed to the central board to be extreme in the way of demands?

Mr. Skrine Stevenson: No.

4261. *Mr. Spender*: You rather suggested that the various powers would be bargaining with each other with the ultimate object of advancing their case with regard to inspection or objection to inspection. Has there been any suggestion that they should all agree to go forward and allow the supervisory authority to have the best reports that it can get and to issue three-monthly or annual reports on the trend of armaments? Would not that in itself be an excellent thing?

Mr. Skrine Stevenson: It would.

4262. *Mr. Spender*: Even apart from limitation would it not be well to let in as much light as possible on the subject? Would not that be an initial step towards limitation, to let people have full knowledge of the facts?

Mr. Skrine Stevenson: I do not think you would get international agreement on countries supplying more complicated returns.

4263. *Mr. Spender*: I suggest the very simplest form of return, without any suggestion of compulsion or imposition. Would it not be a step forward?

Mr. Skrine Stevenson: Yes. But if it were a question of giving the quantities of arms produced then there might be some advantage in having local inspection, but I do not think the local inspectors would be able to add very much to the sum of knowledge of the central supervisory organ.

4264. *Mr. Spender*: They would go to the central supervisory authority. They would not be able to express an opinion or make any definite recommendations.

Mr. Skrine Stevenson: They would not, unless the convention were one for the reduction or limitation of armaments.

4265. *Mr. Spender*: You mean that without limitation it is not possible to make merely a simple report on the state of the arms trade. Is not that possible?

Mr. Skrine Stevenson: Yes, it would give an idea of the amount produced.

4266. *Mr. Spender*: Would it not be very important to get that information if you were going to make a step towards limitation?

Mr. Skrine Stevenson: But if there were no limitation, would there be any advantage in hiding your returns?

4267. *Mr. Spender*: No advantage, and therefore you would get approximately correct returns. You would get a good deal of light thrown upon the subject.

Mr. Skrine Stevenson: You get it now.

4268. *Mr. Spender*: Except that there is no authority now authorised to give it to you.

Mr. Skrine Stevenson: No authority at all, but if a convention such as this were concluded you would have a permanent disarmament commission, which would have the right to call on you to explain the returns.

4269. *Mr. Spender*: I am only suggesting that if there are all these obstacles and difficulties in regard to the form of inspection and supervision to be exercised through the disarmament authority which is to be set up, would it not be wise for the time being to get the authority set up on the ground that you have suggested—for the collection of returns? The returns might be quite simple.

Mr. Skrine Stevenson: Yes, His Majesty's Government would be delighted to see a central organ set up with this as one of its tasks.

4270. *Mr. Spender*: It appears to me—perhaps I am wrong in drawing the inference from what you have said—that these various objections and bargainings have become an obstacle to the setting up of this disarmament commission.

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

Mr. Skrine Stevenson: I do not think that is necessarily so. The fact that a permanent disarmament commission has not been set up is just a result of the general halt that has come in all disarmament matters.

4271. Mr. Spender: It has not been only on account of those objections?

Mr. Skrine Stevenson: No. It lies in the difficulties encountered in the whole gamut of problems covered by the Disarmament Conference.

4272. Dame Rachel Crowdy: Would His Majesty's Government accept any form of agreement which did not include limitation?

Mr. Skrine Stevenson: Yes, they would accept an agreement on the lines put forward in my memorandum.

4273. Chairman: Do I understand that in your view, apart from some agreement as to limitation of armaments, the annual or quarterly publication of information as to the extent of armaments and the intentions of governments to provide themselves with armaments up to a certain amount would very likely lead to an increase of armaments, because given that information one nation might say "We find that so-and-so are going to spend so much on armaments next year and we are not. We shall have to increase our armaments"?

Mr. Skrine Stevenson: They might also use that as an argument with their neighbour and say "If you are going to spend that amount, we also shall have to go further". It was hoped, particularly by the French, that there would be a considerable margin for bargaining in that way. They wanted particularly to have advance information about the amount of arms produced by their neighbours, in order that they might either take their own measures or persuade them to give up such ambitious programmes.

4274. Sir Philip Gibbs: In your historical survey it seems to me that there are certain inconsistencies in the views held by the British Government from time to time. In the first place, the British Government is a signatory to the League of Nations Covenant, in which it says quite clearly, in Article 8, that there are grave objections against the private manufacture and trade in arms. But in paragraph 15 of your statement, His Majesty's Government's reply, drawn up by a sub-committee of the Committee of Imperial Defence, is:

So far as this country is concerned the British Government are not aware of any "grave objections" of a national character and they go on to say, with regard to the international character, that they also do not see any grave objections that are peculiar to private manufacture. That seems to me a very extraordinary inconsistency.

Mr. Skrine Stevenson: You mean it is inconsistent with Article 8 of the Covenant?

4275. Sir Philip Gibbs: Yes.

Mr. Skrine Stevenson: I think the difficulty is that the objections mentioned in Article 8 of the Covenant have not been defined. You do not maintain that it is inconsistent to say that there are no grave objections of a national character? That is not inconsistent.

4276. Sir Philip Gibbs: Of an international character. I think there is also a slight inconsistency with regard to the national character, because I think that Article 8 of the Covenant implied that there were general grave objections in every nation, not excluding Great Britain.

Mr. Skrine Stevenson: It is not actually inconsistent, because it merely says "We are not aware of any grave objections of a national character". H.M. Government do not deny that such objections might exist—and having signed the Covenant they cannot deny that—they merely say they are not aware of such objections as far as this country is concerned. They do not deny

that there are objections of an international character. They say that these objections are shared by state manufacture as well as private. It is not inconsistent.

4277. Sir Philip Gibbs: No. I think there is an apparent inconsistency which needs explaining. I think it wants a little interpretation. Could you give me your own definition of one phrase under the head: "Conclusions reached by His Majesty's Government as a result of their study of the subject". The phrase that I refer to is near the end of paragraph 21 "Strict national control of arms manufacture and trade". What is in your mind? Can you define what you mean by "strict national control"?

Mr. Skrine Stevenson: I think the definition is contained in the articles which are appended to this memorandum. For instance, you have in Article 1

Each High Contracting Party assumes . . . full responsibility.

There the responsibility is laid down. In Article 2 we ensure that the state has the necessary legal and constitutional powers to control their manufacture and trade. Article 3 deals only with supervision. In Article 5 you have a description of what the actual control would be. Manufacturers must have licences before they can manufacture. These licences are valid for a period only and they are revocable at any time. They can only be issued, revoked or renewed by the government. Then in Article 7 you have a description of what the licence to manufacture should contain and the designation of the arms and munitions of war which they are allowed to manufacture. In Article 8 there is a description of the licences which would have to be issued before any export or import of arms is allowed. These licences contain descriptions of articles and the name and address of the exporters, the name and address of the important consignee, and references to the import permits. Article 9 has to do with publicity—a description of the returns which have to be made. The control therefore consists of licensing for manufacture and the giving of written permits for import and export. No manufacture shall take place without the licence of the government. No arms may be moved either into or out of a country without the knowledge and permission of the government.

4278. Sir Philip Gibbs: Of course, some of these things are already laid down at the moment, are they not?

Mr. Skrine Stevenson: In this country, yes.

4279. Sir Philip Gibbs: I should like to ask you whether you yourself feel that it would be a fair reading of these various committees and sub-committees, and so forth, that from the very beginning of the League of Nations there was an admission that the grave objections mentioned in Article 8 of the Covenant did actually exist. Is that a fair interpretation of the activities of these committees?

Mr. Skrine Stevenson: Certainly there were many members of these committees who firmly believed that those grave objections existed. Others were more sceptical.

4280. Sir Philip Gibbs: Would it be fair to say that the Temporary Mixed Commission of 1921 and the Convention of 1925 and the various sub-committees sitting adopted as a basis the fact that the private manufacture of arms and the foreign export of arms was a dangerous business which ought to be controlled more strictly?

Mr. Skrine Stevenson: They had as a basis, obviously, Article 8 of the Covenant. The activities of the League in regard to the control of arms are based on that article and in so far as that article does contain this statement with regard to the grave objections that is correct.

4281. Sir Philip Gibbs: And really the whole purpose of these various committees and commissions is to obtain a stricter control?

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

Mr. Skrine Stevenson: That is right.

4282. Sir Philip Gibbs: Of private manufacture and of the export of arms to other countries?

Mr. Skrine Stevenson: That is right. What His Majesty's Government consider is that the trade should pass through the responsible hands of the government. That is to say, that there should not be trade without strict control by government.

Sir Thomas Allen: My questions have been already put and the answers have been forthcoming.

4283. Professor Gutteridge: Can you tell me what other countries, European or otherwise, have a system of licensing similar to ours?

Mr. Skrine Stevenson: France, Belgium and a number of other countries. As a matter of fact at the moment a great number of countries have control over their export of arms.

4284. Professor Gutteridge: Yes, but I am not referring to temporary control.

Mr. Skrine Stevenson: I know France and Belgium have the licensing system and other European countries as well.

4285. Professor Gutteridge: The Swedes have it?

Mr. Skrine Stevenson: The Swedes have it.

4286. Professor Gutteridge: The Danes and Norwegians?

Mr. Skrine Stevenson: I think most of the Scandinavian countries have it, but I am not certain.

4287. Professor Gutteridge: Have you compared the system at all? Are they mostly on the same lines as our licensing system?

Mr. Skrine Stevenson: Mostly.

4288. Mr. Spender: Is there any country of considerable importance which has not a licensing system?

Mr. Skrine Stevenson: I do not think Japan has a licensing system. I am very sorry, I cannot answer definitely.

4289. Sir Philip Gibbs: Has the United States any such system?

Mr. Skrine Stevenson: They have recently enacted one.

4290. Sir Philip Gibbs: Is it actually in force?

Mr. Skrine Stevenson: Whether it is legally in force, I do not know. I should think so.

4291. Professor Gutteridge: Were the Soviet Republics parties to this committee or not?

Mr. Skrine Stevenson: Yes. They were represented on the latest arms committee which sat in Geneva.

4292. Mr. Spender: Have they a system of export licence?

Mr. Skrine Stevenson: All their export is state controlled.

4293. Professor Gutteridge: That brings me to a matter that is rather troubling me. I suppose it is contemplated that every civilised country in the world should come into this scheme.

Mr. Skrine Stevenson: Certainly. It would be of no use unless all the producing countries came in.

4294. Professor Gutteridge: Would it be of any use even if all producing countries came in; because a country might produce for internal use only.

Mr. Skrine Stevenson: They would have to come in.

4295. Professor Gutteridge: I am thinking of certain countries which are not members of the League. If you had any scheme which did not include them, would there not be difficulty?

Mr. Skrine Stevenson: It would not be a possibility. I think every producing country would demand that all other producing countries should be members.

4296. Dame Rachel Crowdy: They were all represented in an observing capacity at the Conference.

Mr. Skrine Stevenson: Except the Germans.

4297. Dame Rachel Crowdy: Japan and the United States were there.

Mr. Skrine Stevenson: The United States is an active member.

4298. Professor Gutteridge: Germany may become a very great export country as far as we know. You were asked a question just now by Sir Kenneth Lee with regard to the nature of the information. I have here a Geneva blue book which gives the text of a draft convention prepared by the Technical Committee on National Defence Expenditure. You are familiar with that?

Mr. Skrine Stevenson: Yes.

4299. Professor Gutteridge: And at the end there is an Appendix called Model Reconciliation Tables?

Mr. Skrine Stevenson: Yes.

4300. Professor Gutteridge: Are those the documents of which you are speaking?

Mr. Skrine Stevenson: No. That is a slightly different thing. One aspect of the Arms Committee was the National Defence Expenditure Commission. They produced a draft convention which dealt with budgetary publicity only. In connection with the convention which we suggested, as a result of the work in Geneva, a year ago, the information which would have been given would have been rather more than that entailed merely by the budgetary publicity.

4301. Professor Gutteridge: Is that something that runs parallel to it?

Mr. Skrine Stevenson: Yes. It is something which runs parallel to it. It would have to be concluded at the same time. One would be incomplete without the other.

4302. Professor Gutteridge: It does not necessarily exclude this scheme, does it?

Mr. Skrine Stevenson: No. That could be enacted without the arms manufacture scheme.

4303. Professor Gutteridge: They are independent of one another?

Mr. Skrine Stevenson: Yes. They are independent of one another, but the arms convention would be incomplete unless you had that as well.

4304. Professor Gutteridge: It seems to me that, on occasion, inspection of plant might be highly inconvenient?

Mr. Skrine Stevenson: Yes; it might.

4305. Professor Gutteridge: In the present state of European relations, it would be highly inconvenient, would it not?

Mr. Skrine Stevenson: Conceivably very inconvenient, but also entirely ineffective.

4306. Professor Gutteridge: You mean it would be *brutum fulmen*; you simply would not find anything out. In other words, the thing might easily develop into a farce?

Mr. Skrine Stevenson: That is conceivable.

4307. Professor Gutteridge: It cannot work unless there is goodwill?

Mr. Skrine Stevenson: It cannot work unless there is goodwill.

4308. Professor Gutteridge: That applies to a good deal of this disarmament business?

Mr. Skrine Stevenson: The whole of it.

4309. Professor Gutteridge: If you do not get the goodwill of the people it cannot work?

Dame Rachel Crowdy: Is it not good faith more than goodwill that you require?

Mr. Skrine Stevenson: Yes. Unless you have good faith, it does not matter how much goodwill you have.

Professor Gutteridge: You must have good faith, but I should put goodwill before good faith. If you get goodwill, you get good faith.

Chairman: There are two points of view.

Professor Gutteridge: I am a person who believes that if anything comes out of this, it will be done by the brotherhood of man, the friendship of man, you cannot do it by machinery.

4310. Dame Rachel Crowdy: In connection with the possible licensing system, you said that His Majesty's Government was particularly anxious that the movements of all arms should be in the hands of responsible people?

Mr. Skrine Stevenson: Yes.

7 May, 1936.]

Mr. R. C. SKRINE STEVENSON.

[Continued.]

4311. *Dame Rachel Crowdy*: You spoke of a licensing system for the export of arms and then, as far as I remember, you said the consignee, importer and exporter's address must be known. Before His Majesty's Government or any government gave an export licence, would they ask to see an import licence issued by the government of the importing country covering the respectability of the importer?

Mr. Skrine Stevenson: Yes. No import would

be allowed without an import licence, and so no exporting country would take the risk of letting any consignment go until they knew that it would be authorised.

4312. *Dame Rachel Crowdy*: That covers export and import?

Mr. Skrine Stevenson: Yes.

Chairman: Thank you, Mr. Stevenson. We are much obliged to you.

(Adjourned.)

APPENDIX I

THE NEWSPAPER PROPRIETORS ASSOCIATION,
LIMITED.6, BOUVERIE STREET,
LONDON, E.C.4.

5th February, 1936.

To the Secretary of The Royal Commission on the
Private Manufacture of and Trading in Arms.

DEAR SIR,

This memorandum is submitted on behalf of the N.P.A., the membership of which includes the following morning, evening and Sunday newspapers:

The Times.
Daily Telegraph.
Morning Post.
Daily Mail.
News Chronicle.
Daily Express.
Daily Herald.
Daily Mirror.
Daily Sketch.
Financial News.
Financial Times.
Morning Advertiser.
Sporting Life & Sportsman.
Evening Standard.
The Star.
Evening News.
News of the World.
The Observer.
Sunday Times.
Sunday Dispatch.
Sunday Express.
Reynolds's.
The People.
Sunday Graphic & Sunday News.
Sunday Pictorial.
Sunday Referee.
Sunday Sportsman.

While a number of people holding shares in various newspaper companies may also be interested in firms making armaments, we can find no evidence whatever that any of the Directors or Proprietors of the newspapers mentioned above are identified with firms manufacturing armaments in this country in such manner as would justify the slightest suggestion that the newspapers under their control are used for the purpose of advocating the manufacture of armaments in order that pecuniary gain might accrue to them by so doing.

Any innuendo that the National newspapers which comprise our membership are influenced in editorial policy on such vital questions as armament or disarmament by the fact that advertising space is taken by businesses or organisations concerned in manufacturing or opposing the manufacture of armaments,

can be answered by any person of average intelligence who cares to examine the columns of these newspapers.

Evidence concerning advocacy by the Daily Mail and Daily Mirror of an increase in the Air Force was discounted by Mr. Arnold Forster himself when he recognised the good intentions behind this campaign.

It is, of course, unnecessary to remind the Committee that the late Lord Northcliffe's keenness on this question has been maintained by his brother—Lord Rothermere.

Several references have been made to the fact that *The Times* has had foreign correspondents interested in armament firms. Twice during recent months this paper has published replies to these statements to the following effect:—

"Mr. George Boncescu was appointed as local occasional Correspondent in Bucharest in January, 1920. He was selected by our Staff Correspondent in the Balkans on the ground that, having served as Commercial Attaché in the Rumanian Legation in London for several years, he was *au fait* with British standards and requirements. Mr. Boncescu remained Correspondent until March 1927, when he accepted the appointment of Commercial Counsellor in the Rumanian Legation in Washington.

Mr. Roland Bryce was appointed as local occasional Correspondent in Belgrade in August, 1923. His correspondence discontinued in April, 1926, when he left Yugoslavia.

It should be pointed out that these appointments were local and secondary. *The Times* has always had a Staff Correspondent or Staff Correspondents in charge of the Danubian and Balkan countries. They are assisted by Correspondents who are locally appointed to transmit news, but who could exercise no influence upon the policy of *The Times*. Their occasional work for *The Times* in the transmission of news did not involve any connexion between *The Times* and commercial undertakings in general or armaments firms in particular.

It will be seen that the two men mentioned ceased to be connected with *The Times* nine years and ten years ago respectively.

The third person mentioned, Mr. Mavrocordate, merely deputised on a few occasions for Mr. Boncescu."

If the Committee desire to put any oral questions on the above statement, or on any evidence given by witnesses, the Chairman (The Hon. Esmond Harmsworth), or the Vice-Chairman (Colonel the Hon. E. F. Lawson) and myself would attend for that purpose.

Yours faithfully,

T. W. McARA.

APPENDIX II

MEMORANDUM PREPARED BY THE FOREIGN OFFICE SUMMARISING
THE WORK OF THE LEAGUE OF NATIONS IN REGARD TO
PARAGRAPH (5) OF ARTICLE 8 OF THE COVENANT

Article 8 of the Covenant deals with the reduction of armaments, and paragraph (5) of this article is as follows:—

"The Members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those Members of the League which are not able to manufacture the munitions and implements of war necessary for their safety."

The work of the League in regard to this paragraph may, for convenience, be divided into three phases. From 1920-1925 it was considered by the Temporary Mixed Commission; from 1925-1929 by the Council through a Special Commission; and from 1932 to the present time by a Committee of the Disarmament Conference.

A. The Temporary Mixed Commission.

2. The Temporary Mixed Commission was appointed by the First Assembly (1920) to prepare reports and proposals for the reduction of armaments as provided for by Article 8 of the Covenant. It was composed of persons chosen for their individual competence, not of government representatives. Paragraph (5) of Article 8 was considered by a sub-committee of the Commission.

3. The sub-committee produced an interim report in 1921.(a) This report was an attempt to clear the ground and was in two parts. The first part dealt with private manufacture. The "grave objections" to the manufacture by private enterprise of war material were not defined in the Covenant: they could not be deduced from the deliberations of the committee which drafted the Covenant. The committee therefore drew up a list of the objections which had been formulated: and without making any positive recommendations put forward observations on the problems and difficulties to be solved (b) if private manufacture were prohibited (b) if private manufacture were to be subject to control. Finally the committee considered a proposal that an international conference should be summoned to deal with private manufacture and arms traffic. The committee recommended the Assembly to decide in principle in favour of such a conference.

The second part of the report dealt with the traffic in arms, and was principally concerned with the position as regards the ratification of the Convention of St. Germain, signed on September 10, 1919.(b) The committee recognised that the key to the general acceptance of this convention lay in the attitude of the United States and recommended that the principal aim should be to bring the Convention into operation at the earliest possible moment.

4. The Second Assembly (1921) resolved that an international conference on the private manufacture of and trade in arms should meet as soon as possible, and that the Temporary Mixed Commission should prepare the programme of the Conference, and a draft convention for its consideration. The Council, however, decided in October that it was premature to fix a date for a conference in view of the fact that the manufacture of arms was carried on in countries not yet members of the League. The Commission reported in 1922.(c) As regards private manufacture the report gave an account of the preparatory studies which it was conducting (including the study of the project of a draft agreement put forward by Sir Hubert Llewellyn Smith) and

expressed the opinion that "the subject of private manufacture could not be divorced from the subject of traffic in arms". On this latter subject the Commission reported that the refusal (which had been formally made known) of the United States to ratify the Convention of St. Germain constituted a new situation, and that the question of a convention on arms traffic must be reconsidered in its entirety. The Commission also approved the principle of applying a system of national licences to private manufacture of arms.

5. The Third Assembly (1922) passed a resolution in favour of an international conference on private manufacture, but added that the United States Government should be asked to formulate its objections to the Convention of St. Germain and to put forward proposals to meet them; and that the Temporary Mixed Commission should prepare a scheme for the control of traffic in arms for consideration by a conference, in which non-members of the League should be invited to participate. The Council in January 1923 however decided that the question of private manufacture and trade were so closely connected that it was inadvisable to summon a conference solely to deal with the former. The Temporary Mixed Commission in February 1923 decided that neither the preparation of a new scheme for the control of traffic nor the execution of a scheme for the control of private manufacture could be successfully undertaken until the co-operation of the United States Government had been obtained. On the Commission's recommendation the Council accordingly addressed in April 1923 a communication to the United States Government, the reply to which had not arrived when the Commission made its third report in August 1923.(d) The reply was sent in September and was considered at the Assembly; it reiterated the objections of the United States to ratification of the Convention of St. Germain but it "proposed no method and made no suggestion likely to permit of an international solution of the problem in co-operation with the United States". Accordingly the Third Assembly resolved that, as regards traffic, the Temporary Mixed Commission should prepare a new convention to replace that of St. Germain, and that United States representatives should be invited to collaborate in the work. As regards private manufacture, the Temporary Mixed Commission was invited to refer the project of agreement (referred to in the preceding paragraph) to the Economic Committee of the League and to endeavour, in co-operation with the Committee, to draw up a draft convention. The Council on receiving draft conventions both on traffic and private manufacture was to consider the question of summoning an international conference.

6. The Temporary Mixed Commission reported its efforts to execute this resolution to the Fifth Assembly (1924).(e) As regards traffic, it obtained the unofficial collaboration of the United States and was able to draw up a draft convention. In undertaking this work the Commission was guided primarily by Article 23 of the Covenant, which runs as follows:—

"Subject to and in accordance with the provisions of international conventions existing or hereafter to be agreed upon, the Members of the League:

(d) will entrust the League with the general supervision of the trade in arms and ammunition with the countries in which the control of this traffic is necessary in the common interest."
